		Winds and Men. By C. H. F. B.-L.	784
		Woodland Echoes. By Edith C. Adams	576

THE MONTH: SCIENCE AND ARTS

Accumulator, A Non-Spilling	414	Bed Settee, A Concealed-	413
Accumulator Charger for Alternating Current Circuits, A Fool-Proof Wireless	831	Bed Wardrobe, An Under-the-	477
Aerial for Listening-In Sets, A New	143	'Behold the Hebrides!'	480
Aerials, Novelties in Wireless	687	Boat, An All-Metal Flying	768
Air-Whistles for Motor-Ships, Visible	331	Boiler, An Efficient Steamer and	63
Alarm, A Bandit	208	Boiler-Flues by Steam, Cleaning of	206
Ash-Tray, An Arm-Chair	205	Bridge in the World, The Biggest Suspension-	272
Australian Encyclopedia, An	829	British-Made Wickless Oil-Stove, A	415
Battery Charging at Home, Free	208	Brushes, Water-Cleaning	416
Battery-Ignition Device, A Novel	208	Buoys, 'Sun-Valves' for Lighted	479
		Butter-Maker, A Home	414

	PAGE		PAGE
Cancer, The Cause of	687	Gas-Cooker, An Improved	621
Carillons in the World, The Largest	622	Gas-Cooker, An Up-to-date	61
Cars, A New Luggage-Trailer for Touring-	334	Gas Fire-Lighter, A	624
Cars, Fixed Screw-Jacks for	143	'Gas' from the Carburetter, Mixing the	623
Cars, Safe Starting for	62	Gauge, A Profile	544
'Catwhisker,' The Possible Passing of the	479	Gramophone, An Electric Motor for any	686
Cement, English Rapid-Hardening	207	Growth of Wool, Promoting the	688
Chair Music-Stool, A	415	Hammock Stand, A Portable	622
Chair with Many Combinations, A	62	Hands, No More Stained	63
Charger for Alternating Current Circuits, A		Hand Transmitter for Wireless Telephony, A	478
Fool-Proof Wireless Accumulator	831	Haulage, Petrol Tractors for Yard	207
Charging at Home, Free Battery	208	Haymaking, The Possible Doom of	63
Chemical Elements, Two New	544	Heat for the House from the Kitchen Range	478
Cleaner, A Novel Vacuum	271	'Hebrides! Behold the'	480
Cleaning of Boiler-Flues by Steam	206	Home, A Refrigerator for the	271
Cleaning Silver, A New Method of	832	Home Butter-maker, A	414
Clean Milk	542	Home-Made Soda-Water, Cheap	687
Clip for Hose Connections, An Ideal	332	Hooter for Factories, A Simple Electric	767
Coal and Gas Cooker, A Combined	413	Hose Connections, An Ideal Clip for	332
Coal, Making the Best Use of	767	Ice by Turning a Handle	543
Colouring Matter in Food, Preservatives and	141	Ice-Maker, A Thermos	544
Combination Domestic Tool, A	543	Ignition Device, A Novel Battery	208
Concealed-Bed Settee, A	413	Ironing-Boards, Something New in	414
Cooker, A Combined Coal and Gas	412	Jacks for Cars, Fixed Screw-	143
Cooker, A New Fireless	142	Jug, A Fly-Proof Milk	478
Cooker, An Improved Gas-	621	Kettle, A Novel	831
Cooker, An Up-to-Date Gas-	61	Kitchen Range, Heat for the House from the	478
Cooling by Evaporation	480	Kitchen-Ranges, The Last Word in	541
Correction, A	832	Kitchen Table, A Stainless	542
Cot-Settee, A	270	Lamp, A Long-Term Paraffin	413
Dampers for Open Fires, Revival of	541	Lamp Shade, A New Form of	624
Dark, Finding the Electric-Light Switch in the	206	Larder, A Water-Cooled	416
Deaf, A New Aid to the	142	Lifeboats, A Hand Wireless Transmitter for	333
Deep-Well Pump, A Notable	205	Lifeboats, Passenger-Propelled, Oarless	766
Diving Suit, A Deep-	333	Lighted Buoys, 'Sun-Valves' for	479
Domestic Tool, A Combination	543	Lighter, A Gas Fire-	624
Doom of Haymaking, The Possible	63	Lighthouse in the World, The Most Powerful	542
Dust-Cart, A Motor	832	Listening-In Sets, A New Aerial for	143
Dynamos, Wind	621	Listening-In Sets, Tubular Earths for	477
Earths for Listening-In Sets, Tubular	477	Locomotive, A Gigantic American	477
Echoes, Sounding by	830	Locomotive for Russia, An Oil-Engined	62
Electric Hooter for Factories, A Simple	767	Locomotive, The Largest British	765
Electric-Light Switch in the Dark, Finding the	206	Luggage-Trailer for Touring-Cars, A New	334
Electric Motor for any Gramophone, An	686	Magic Lantern, A Revolutionary Development	207
Electricity from Wind-Power	332	Mattresses, A Remedy for Sagging	206
Electricity, Typing by	272	Measuring Tea-Caddy, A	414
Elements, Two New Chemical	544	Milk, Clean	542
Encyclopædia, An Australian	829	Milk Jug, A Fly-Proof	478
English Rapid-Hardening Cement	207	Mixing the 'Gas' from the Carburetter	623
Evaporation, Cooling by	480	Motor Dust-Cart, A	832
Expanding Table without Loose Leaves, An	64	Motor for any Gramophone, An Electric	686
Factories, A Simple Electric Hooter for	767	Motors, An Improved Priming Plug for	144
Filtering the Petrol	623	Motor-Ships, Visible Air-Whistles for	331
Fire, A Portable Open	334	Music-Stool, A Chair	415
Fireless Cooker, A New	142	Non-Spilling Accumulator, A	414
Fire-Lighter, A Gas	624	Oarless Lifeboats, Passenger-Propelled	766
Fires, Revival of Dampers for Open	541	Oil-Engined Locomotive for Russia, An	62
Fixed Screw-Jacks for Cars	143	Oil-Stove, A British-Made Wickless	415
Flying-Boat, An All-Metal	768	Oil-Stove, A New Form of	63
Fly-Proof Milk Jug, A	478	Open Fire, A Portable	334
Floor-Polisher, An Effective	624	Open Fires, Revival of Dampers for	541
Foods, Preservatives and Colouring Matter in	141	Pad, A New Stamp	144
Forest Regions, Power from Wood for	623	Pamphlets on Rural Industries	270
Fruit-Trees, A Rustless Metal Wall-Clip for	766	Paper-Making Scheme, A Huge	205
Gas-Cooker, A Combined Coal and	413	Paraffin Lamp, A Long-Term	413

	PAGE		PAGE
Passing of the 'Catwhisker,' The Possible	479	Steamer and Boiler, An Efficient	63
Petrol, Filtering the	623	Stove, A New Form of Oil	63

Chambers's Journal

SEVENTH SERIES

‘TIS SIXTY YEARS SINCE.’

THOMAS HARDY AND *CHAMBERS'S JOURNAL*.

1865. OUR GREATEST CONTRIBUTOR. 1925.

FIRST and Foremost among its living Contributors *Chambers's Journal* is proud to reckon Thomas Hardy, O.M.—and G.O.M. of English Letters. Sixty summers have come and gone since he made his first appearance in print—in these pages.

It was at the beginning of the year 1865 that Mr Hardy sent us ‘How I Built myself a House.’ This diverting little sketch, he himself informs us, was written ‘to amuse some architect’s pupils I was associated with.’ It was published in *Chambers's Journal* for March 18, 1865, and with the author’s kind concurrence we reprint it in this issue—the subject never having been of greater actuality than it is to-day. In those far-off times Mr Hardy was a rising young architect of four-and-twenty, winning prizes for designs, and not yet looking for laurels in the arena of literature. But soon he was to turn from storeys to stories, and the three-score years that have intervened have established him, as poet and as prose-writer, the revered Doyen of English writers, the unchallenged head of our Contemporary Literature.

To mark this Diamond Jubilee of so eminent a contributor we have pleasure in printing below a hitherto unpublished poem of Mr Hardy’s, which makes a happy companion picture to the sixty-year-old sketch. It would, we believe, be difficult, if not impossible, to find in the periodical literature of any country a parallel case of contributions to the same Journal by the same master pen with a span of sixty years between them. On this unique achievement we congratulate Mr Hardy—and we congratulate ourselves.

And at this, the outset of a New Year, we would express the hope that, throughout 1925, the homes of all our readers and of those who, like Mr Hardy, have spoken to them through our columns, may never lack, within doors and without, voices that ring with an infectious ‘Joy at being Alive.’

THE EDITOR.

A BIRD-SCENE AT A RURAL DWELLING.

WHEN the inmate stirs, the birds retire discreetly
From the window-ledge, whereon they whistled sweetly
And on the step of the door
In the misty morning hoar;
But now the dweller is up they flee
To the long-armed neighbouring codlin-tree;
And when he comes fully forth they seek the garden,
And call from the lofty costard, as asking pardon
For shouting so near before
In their joy at being alive—
Meanwhile the halting clock within strikes five.

I know a domicile of brown and green,
Where for a hundred summers there have been
Just such enactments, just such day-breaks seen.

THOMAS HARDY.

HOW I BUILT MYSELF A HOUSE.

By THOMAS HARDY.

[Reprinted from *Chambers's Journal* for March 18, 1865.]

My wife Sophia, myself, and the beginning of a happy line, formerly lived in the suburbs of London, in the sort of house called a Highly-Desirable Semi-detached Villa. But in reality our residence was the very opposite of what we wished it to be. We had no room for our friends when they visited us, and we were obliged to keep our coals out of doors in a heap against the back-wall. If we managed to squeeze a few acquaintances round our table to dinner, there was very great difficulty in serving it; and on such occasions the maid, for want of sideboard room, would take to putting the dishes in the staircase, or on stools and chairs in the passage, so that if anybody else came after we had sat down, he usually went away again, disgusted at seeing the remains of what we had already got through standing in these places, and perhaps the celery waiting in a corner hard by. It was therefore only natural that on wet days, chimney-sweepings, and those cleaning times when chairs may be seen with their legs upwards, a tub blocking a doorway, and yourself walking about edgeways among the things, we called the villa hard names, and that we resolved to escape from it as soon as it would be politic, in a monetary sense, to carry out a notion which had long been in our minds.

This notion was to build a house of our own a little further out of town than where we had hitherto lived. The new residence was to be right and proper in every respect. It was to be of some mysterious size and proportion, which would make us both peculiarly happy ever afterwards—that had always been a settled thing. It was neither to cost too much nor too little, but just enough to fitly inaugurate the new happiness. Its situation was to be in a healthy spot, on a stratum of dry gravel, about ninety feet above the springs. There were to be trees to the north, and a pretty view to the south. It was also to be easily accessible by rail.

Eighteen months ago, a third baby being our latest blessing, we began to put the above-mentioned ideas into practice. As the house itself, rather than its position, is what I wish particularly to speak of, I will not dwell upon the innumerable difficulties that were to be overcome before a suitable spot could be found. Maps marked out in little pink and green oblongs clinging to a winding road, became as familiar to my eyes as my own hand. I learned, too, all about the coloured plans of Land to be Let for Building Purposes, which are exhibited at railway stations and in agents' windows—that sketches of cabbages in rows, or artistically irregular, meant large trees that would afford a

cooling shade when they had been planted and had grown up—that patches of blue shewed fishponds and fountains; and that a wide straight road to the edge of the map was the way to the station, a corner of which was occasionally shewn, as if it would come within a convenient distance, disguise the fact as the owners might.

After a considerable time had been spent in these studies, I began to see that some of our intentions in the matter of site must be given up. The trees to the north went first. After a short struggle, they were followed by the ninety feet above the springs. Sophia, with all wifely tenacity, stuck to the pretty view long after I was beaten about the gravel subsoil. In the end, we decided upon a place imagined to be rather convenient, and rather healthy, but possessing no other advantage worth mentioning. I took it on a lease for the established period, ninety-nine years.

We next thought about an architect. A friend of mine, who sometimes sends a paper on art and science to the magazines, strongly recommended a Mr Penny, a gentleman whom he considered to have architectural talent of every kind, but if he was a trifle more skilful in any one branch of his profession than in another, it was in designing excellent houses for families of moderate means. I at once proposed to Sophia that we should think over some arrangement of rooms which would be likely to suit us, and then call upon the architect, that he might put our plan into proper shape.

I made my sketch, and my wife made hers. Her drawing and dining rooms were very large, nearly twice the size of mine, though her doors and windows shewed sound judgment. We soon found that there was no such thing as fitting our ideas together, do what we would. When we had come to no conclusion at all, we called at Mr Penny's office. I began telling him my business, upon which he took a sheet of foolscap, and made numerous imposing notes, with large brackets and dashes to them. Sitting there with him in his office, surrounded by rolls of paper, circles, squares, triangles, compasses, and many other of the inventions which have been sought out by men from time to time, and perceiving that all these were the realities which had been faintly shadowed forth to me by Euclid some years before, it is no wonder that I became a puppet in his hands. He settled everything in a miraculous way. We were told the only possible size we could have the rooms, the only way we should be allowed to go upstairs, and the exact quantity of wine we might order at once, so as to fit the wine-cellar he had in his head. His professional opinions,

propelled by his facts, seemed to float into my mind whether I wished to receive them or not. I thought at the time that Sophia, from her silence, was in the same helpless state; but she has since told me it was quite otherwise, and that she was only a little tired.

I had been very anxious all along that the stipulated cost, eighteen hundred pounds, should not be exceeded, and I impressed this again upon Mr Penny.

'I will give you an approximate estimate for the sort of thing we are thinking of,' he said. 'Linem.' (This was the clerk.)

'Did you speak, sir?'

'Forty-nine by fifty-four by twenty-eight, twice fourteen by thirty-one by eleven, and several small items which we will call one hundred and sixty.'

'Eighty-two thousand four hundred'—

'But eighteen hundred at the very outside,' I began, 'is what'—

'Feet, my dear sir—feet, cubic feet,' said Mr Penny. 'Put it down at sixpence a foot, Linem, remainders not an object.'

'Two thousand two hundred pounds.' This was too much.

'Well, try it at something less, leaving out all below hundreds, Linem.'

'About eighteen hundred and seventy pounds.'

'Very satisfactory, in my opinion,' said Mr Penny turning to me. 'What do you think?'

'You are so particular, John,' interrupted my wife. 'I am sure it is exceedingly moderate: elegance and extreme cheapness never do go together.'

(It may be here remarked that Sophia never calls me 'my dear' before strangers. She considers that, like the ancient practice in besieged cities of throwing loaves over the walls, it really denotes a want rather than an abundance of them within.)

I did not trouble the architect any further, and we rose to leave.

'Be sure you make a nice conservatory, Mr Penny,' said my wife; 'something that has character about it. If it could only be in the Chinese style, with beautiful ornaments at the corners, like Mrs Smith's, only better,' she continued, turning to me with a glance in which a broken tenth commandment might have been seen.

'Some sketches shall be forwarded, which I think will suit you,' answered Mr Penny pleasantly, looking as if he had possessed for some years a complete guide to the minds of all people who intended to build.

It is needless to go through the whole history of the plan-making. A builder had been chosen, and the house marked out, when we went down to the place one morning to see how the foundations looked.

It is a strange fact, that a person's new house drawn in outline on the ground where it is to stand, looks ridiculously and inconveniently

small. The notion it gives one is, that any portion of one's after-life spent within such boundaries must of necessity be rendered wretched on account of bruises daily received by running against the partitions, doorposts, and fireplaces. In my case, the lines shewing sitting-rooms seemed to denote cells; the kitchen looked as if it might develop into a large box; whilst the study appeared to consist chiefly of a fireplace and a door. We were told that houses always looked so; but Sophia's disgust at the sight of such a diminutive drawing-room was not to be lessened by any scientific reasoning. Six feet longer—four feet then—three it must be, she argued; and the room was accordingly lengthened. I felt rather relieved when at last I got her off the ground, and on the road home.

The building gradually crept upwards, and put forth chimneys. We were standing beside it one day, looking at the men at work on the top, when the builder's foreman came towards us.

'Being your own house, sir, and as we are finishing the last chimney, you would perhaps like to go up,' he said.

'I am sure I should much, if I were a man,' was my wife's observation to me. 'The landscape must appear so lovely from that height.'

This remark placed me in something of a dilemma, for it must be confessed that I am not given to climbing. The sight of cliffs, roofs, scaffoldings, and elevated places in general, which have no sides to keep people from slipping off, always causes me to feel how infinitely preferable a position at the bottom is to a position at the top of them. But as my house was by no means lofty, and it was but for once, I said I would go up.

My knees felt a good deal in the way as I ascended the ladder; but that was not so disagreeable as the thrill which passed through me as I followed my guide along two narrow planks, one bending beneath each foot. However, having once started, I kept on, and next climbed another ladder, thin and weak-looking, and not tied at the top. I could not help thinking, as I viewed the horizon between the steps, what a shocking thing it would be if any part should break; and to get rid of the thought, I adopted the device of mentally criticising the leading articles in that morning's *Times*; but as the plan did not answer, I tried to fancy that, though strangely enough it seemed otherwise, I was only four feet from the ground. This was a failure too; and just as I had commenced upon an idea that great quantities of feather-beds were spread below, I reached the top scaffold.

'Rather high,' I said to the foreman, trying, but failing to appear unconcerned.

'Well, no,' he answered; 'nothing to what it is sometimes (I'll just trouble you not to step upon the end of that plank there, as it will turn over); though you may as well fall from here as

from the top of the Monument for the matter of life being quite extinct when they pick you up,' he continued, looking around at the weather and the crops, as it were.

Then a workman, with a load of bricks, stamped along the boards, and overturned them at my feet, causing me to shake up and down like the little servant-men behind private cabs. I asked, in trepidation, if the bricks were not dangerously heavy, thinking of a newspaper paragraph headed 'Frightful Accident from an Overloaded Scaffold.'

'Just what I was going to say. Dan has certainly too many there,' answered the man. 'But it won't break down if we walk without springing, and don't sneeze, though the mortar-boy's hooping-cough was strong enough in my poor brother Jim's case,' he continued abstractedly, as if he himself possessed several necks, and could afford to break one or two.

My wife was picking daisies a little distance off, apparently in a state of complete indifference as to whether I was on the scaffold, at the foot of it, or in St George's Hospital; so I roused myself for a descent, and tried the small ladder. I cannot accurately say how I did get down; but during that performance, my body seemed perforated by holes, through which breezes blew in all directions. As I got nearer the earth, they went away. It may be supposed that my wife's notion of the height differed considerably from my own, and she inquired particularly for the landscape, which I had quite forgotten; but the discovery of that fact did not cause me to break a resolution not to trouble my chimneys again.

Beyond a continual anxiety and frequent journeyings along the sides of a triangle, of which the old house, the new house, and the architect's office were the corners, nothing worth mentioning happened till the building was nearly finished. Sophia's ardour in the business, which at the beginning was so intense, had nearly burned itself out, so I was left pretty much to myself in getting over the later difficulties. Amongst them was the question of a porch. I had often been annoyed whilst waiting outside a door on a wet day at being exposed to the wind and rain, and it was my favourite notion that I would have a model porch whenever I should build a house. Thus it was very vexing to recollect, just as the workmen were finishing off, that I had never mentioned the subject to Mr Penny, and that he had not suggested anything about one to me.

'A porch or no porch is entirely a matter of personal feeling and taste,' was his remark, in answer to a complaint from me; 'so, of course, I did not put one without its being mentioned. But it happens that in this case it would be an improvement—a feature, in fact. There is this objection, that the roof will close up the window of the little place on the landing; but we may

get ventilation by making an opening higher up, if you don't mind a trifling darkness, or rather gloom.'

My first thought was that this might tend to reduce myself and family to a state of chronic melancholy; but remembering there were reflectors advertised to throw sunlight into any nook almost, I agreed to the inconvenience, for the sake of the porch, though I found afterwards that the gloom was for all time, the patent reflector, naturally enough, sending its spot of light against the opposite wall, where it was not wanted, and leaving none about the landing, where it was.

In getting a house built for a specified sum by contract with a builder, there is a certain pit-fall into which unwary people are sure to step—this accident is technically termed 'getting into extras.' It is evident that the only way to get out again without making a town-talk about yourself, is to pay the builder a large sum of money over and above the contract amount—the value of course of the extras. In the present case, I knew very well that the perceptible additions would have to be paid for. Common sense, and Mr Penny himself perhaps, should have told me a little more distinctly that I must pay if I said 'yes' to questions whether I preferred one window a trifle larger than it was originally intended, another a trifle smaller, second thoughts as to where a doorway should be, and so on. Then came a host of things 'not included'—a sink in the scullery, a rain-water tank and a pump, a trap-door into the roof, a scraper, a weather-cock and four letters, ventilators in the nursery, same in the kitchen, all of which worked vigorously enough, but the wrong way; patent remarkable bell-pulls; a royal letters extraordinary kitchen-range, which it would cost exactly threepence three-farthings to keep a fire in for twelve hours, and yet cook any joint in any way, warm up what was left yesterday, boil the vegetables, and do the ironing. But not keeping a strict account of all these expenses, and thinking myself safe in Mr Penny's hands from any enormous increase, I was astounded to find that the additions altogether came to some hundreds of pounds. I could almost go through the worry of building another house, to shew how carefully I would avoid getting into extras again.

Then they have to be wound up. A surveyor is called in from somewhere, and, by a fiction, his heart's desire is supposed to be that you shall not be overcharged one halfpenny by the builder for the additions. The builder names a certain sum as the value of a portion—say double its worth, the surveyor then names a sum, about half its true value. They then fight it out by word of mouth, and gradually bringing their valuations nearer and nearer together, at last meet in the middle. All my accounts underwent this operation.

A Families-removing van carried our furniture and effects to the new building without giving us much trouble; but a number of vexing little incidents occurred on our settling down, which I should have felt more deeply had not a sort of Martinmas summer of Sophia's interest in the affair now set in, and lightened them considerably. Smoke was one of our nuisances. On lighting the study-fire, every particle of smoke came curling into the room. In our trouble, we sent for the architect, who immediately asked if we had tried the plan of opening the register to cure

it. We had not, but we did so, and the smoke ascended at once. The last thing I remember was Sophia jumping up one night and frightening me out of my senses with the exclamation: 'O that builder! Not a single bar of any sort is there to the nursery-windows. John, some day those poor little children will tumble out in their innocence—how should they know better?—and be dashed to pieces. Why *did* you put the nursery on the second floor?' And you may be sure that some bars were put up the very next morning.

HIS CLUB.

By ALAN SULLIVAN, Author of *Man's Work*, &c.

I.

PETTIGREW arrived every day at the club just as the big clock in the hall pointed to eleven. The clock was silent, like every other appanage of that august establishment. To belong to the Guelph had meant something in the past, though perhaps not so much of late. The average age of its members was about sixty.

He came in, taking always the same number of steps, gave the same friendly, little nod to the hall porter, hung coat, stick, and hat on the same peg, proceeded by the same route to the reading-room, and began with the same paper.

To little Pettigrew there was nothing humdrum in all this. It represented life and the fullness thereof. He had been a member now for nearly forty years. The man who put him up, and the other two who seconded, were long since dead. They had not thought of introducing him to any of the other members before they died, and, of course, Pettigrew had not introduced himself. The Guelph wasn't the sort of club where one did that. So he hadn't met any of them personally; though he knew most of them to nod to, and all the distinguished ones by name.

It pleased him very much when they nodded back, a short British nod that took everything for granted and then promptly dismissed it. It was sufficient all round that they were all members here; therefore beyond any question or breath of uncertainty. For the first few years he used to hope that matters would progress further, and that some of them would casually drop into a chair at his table. But nothing happened. Thinking it over, as he did many a time, Pettigrew decided that perhaps it was just as well. It would only have meant bridge, or whist, and this he could not afford.

The Guelph was, of course, Pettigrew's home, the home of both body and spirit, and he loved it more than anything in the world. He loved its vastness and sombre distinction, the vista

of great rooms with red marble columns—where the foot sank noiseless and everything was cushioned against the outer world, so that the drone and rumble of London were reduced to the merest faint vibration. He loved the wide fireplaces where huge piles of coal blazed on the slightest provocation, and the deep, brown leather chairs, against whose backs might be seen resting at certain hours the same heads, white, grizzled, or bald. He liked the long tables, also leather-topped, on which hundreds of papers and periodicals seemed to rearrange themselves continually, no matter what disorder was created. And, not least, he liked the dining-room with its glass like diamonds, and the lustre of silver and linen, and the gravity of the waiters, each with his own two tables—waiters who seemed to have sublimated all personal desire and emotion in one grave offering of themselves. How quiet they were—how completely attentive—how well they understood and remembered. Not meals these, but sacraments, thought little Pettigrew, being of a reverential nature himself.

What most men feel in their clubs is that here they are safe from something. It may be from emotion, or anxieties—of which there are too many outside reminders—or debtors, creditors or duns, or certain officious friends, or enemies, or women—or the lack of them—or children, business or the lack of business, or conversation, formality or informality. To put an impregnable wall between its members and all this, when desired, is the first office of every good club. That is why addresses are not given by the hall porter, nor any shred of information which might expose a member to anything whatever in the way of discomfort or intrusion. That is why sane men cling to their club as a drowning man grasps a floating spar. It is the one thing in the world meant solely for him.

II.

Little Pettigrew grasped more firmly than all the others. He had no business or creditors or

women or children to escape from. He had nothing except the club—and a bare sufficiency to be a member.

When he was sixty-eight—he was seventy now—the greater part of his savings was lost in the preferred stock of a foreign railway. The thing shocked him horribly, and there had been an element of unfairness about the catastrophe. Thousands of others were in a similar box. With them he hoped for a year or so to get something out of the wreck, then surrendered to the inevitable. There remained to him the sum of fifteen hundred pounds in British Consols, but the interest on this was negligible as an income. So Pettigrew decided to live on his capital.

He worked it out in a characteristic fashion. After consulting all the insurance records he could get hold of, it appeared, judging by averages, that he might reckon another five years of life. That would bring him to seventy-four. Three hundred a year for five years, with a little interest—constantly decreasing—coming in. The interest would give him something to play with. He budgeted, however, on the three hundred, and, this settled, felt a good deal happier.

There was, of course, the matter of his heart, which might upset everything. He had known about it for years, but the best advice he could get was, that if he continued to take the same care of himself as he did now there was no reason why he should not attain a good, round age. It was a case of 'a quiet, equable life, no excitement—no running upstairs or after a bus; better not smoke; glass of sherry at lunch, small whisky and soda at dinner. You can tell by the feel of the thing when you're overdoing it—five guineas, please—thank you—good morning.'

Ever since then he had gone to Harley Street on the second of January, and on the same errand. The great specialist was getting older too, he could see that, and in their jointly declining years these two white-haired old gentlemen, each a little nearer the goal, used to wonder in the back of their heads which of them would reach it first. Then Pettigrew always betook himself to the Guelph, read the *Morning Post* in the east chair of the west bay-window, inspected the sodden expanse of St James's Park, and partook of lunch with one small sherry, feeling that it was pretty clear sailing for the next twelvemonth. After lunch he had a nap in the silence room, took a leisurely stroll in Hyde Park round by The Row, the bandstand, and Stanhope Gate, and reached the club in comfortable time for tea. The rest of the day was very simple.

The other part of Pettigrew's life was spent in a single room off the Edgware Road, an address he had never given to the hall porter. He prepared his own breakfast of tea, toast,

marmalade, and one boiled egg. When eggs cost over twopence each, the really good ones, he had a kipper. In one corner of the room were some hooks behind a dingy chintz where he kept his four suits. These, he reckoned, would see him through. Beneath, on a shelf, were his shoes in a shining row, and all on trees. Under these, his spats. In the corner next the washstand, his trouser press. There was a gas grate and a ring, with a shilling slot meter. On the table a few photographs, one of his wife, dead forty years ago, the year before he joined the Guelph. Another—of the child who died with her. A very ancient one of himself in football clothes—he had been rather fast on his feet—his bare arms folded so as to make his muscles bulge. He noticed that fellows did the same thing now for the illustrated papers. A few books—*Marcus Aurelius*, Bacon's *Essays*, Burnaby's *Ride to Khiva*, the *Pilgrim's Progress*, and *The Light of Asia*. On the walls very faded prints of some of the places he visited on his wedding journey. In the far corner, his bed, very straight, neat and narrow. He made it himself, reversing the top sheet every Saturday, and putting it underneath. Only the bottom one went to the laundry.

In dress he was extremely particular, and he wore spats the year round, which in summer went happily with his blue suit. A valet called every fortnight, and if one was careful about one's legs a trouser crease lasted a long time. As to evenings, he wore full dress only at the annual club dinner, or when the club happened to entertain some distinguished guest, which occurred but seldom. All his things were well made, and might be depended on for another four years. The blue and the gray in summer, gray and brown in winter, brown and blue in spring. Never the same suit on consecutive days. It was a great help to have the thing settled.

III.

There were two weeks out of fifty-two when Pettigrew felt extremely upset. This took place during the annual house-cleaning, when, first, hospitality was received from the Bloomington, and, second, it was returned. No one seemed to know anything about this arrangement except that it was a legacy of the past, very undesirable and equally unalterable. The Bloomington men felt the same way, but neither club would make the first move. One couldn't tell 500 men that—well!—The average age of Bloomington members was, perhaps, ten years less, which made all the difference. You could hear any one of them talking across the smoking-room. The Bloomington was about as old as the Guelph, say seventy years, but seemed to lack tradition. It entertained just as many distinguished guests, and had about the same number of distinguished

members. But there remained that difference. The Bloomington chaps held similar views, and among themselves gave identical reasons. Year after year the committee of one club entertained that of the other, and they interchanged the most admirable sentiments. It was really not feasible to alter the arrangement. These things weren't done.

Of course Pettigrew knew all about it. He heard it discussed by various members, after a glance round to see that there were no visitors, but no one ever talked it over with him. Once he thought that Whitchurch, who wrote the book about Burma, and whom he knew very well by name and appearance, was going to speak to him; but the latter, a little blind, had evidently taken him for some one else and moved on with a grunt. Pettigrew was aching to talk, but hadn't the courage, so he only flushed and went on with his paper, a prim, pathetic, little figure in carefully-brushed blue clothes, a very white collar, white spats, blue bow-tie, and a small, sensitive face with delicate mouth and lips.

Naturally, nothing about the Guelph, or anything that happened in it, ever appeared in the papers, except the secretary's formal notice of exchange of hospitality with the Bloomington. When one entered its doors one was lost to the world; and when Gibbs, O.B.E., chairman of the house committee, dropped dead in the billiard-room, it was merely stated that he had died in his club. Nothing disturbed the serenity of those halls, except an American who had been admitted, and persisted in talking in his usual voice. This occasioned a good deal of criticism of the member who sponsored him, and who privately admitted that his friend was too damned natural. Pettigrew, overhearing this, silently agreed. No; the Guelph was, in short, a haven where one could inhabit a shell within a shell, look out of the window at the most interesting street in the world, be protected and respected, if in silence, and bathed in the oil of comfort.

Pettigrew therefore treasured the club with a great and abiding passion. Others might like it. He adored it. By reason of it he was rescued from nonentity in a back room, and enabled to maintain unsullied that idea of Form which to so many lonely and elderly males is a deep and fortifying religion. It gave him something to live up to, and life had become one long, harmless dress parade. When he sat in the bay-window he caught the eyes of those who looked up, and perceived their chance wonderings as to who might be that perfectly-dressed man overlooking the centre of the world. It didn't matter that he was only Pettigrew. The pleasure persisted. He knew that he gave the impression of being a retired professional man of good birth and ample means. And since most of us live for the sake of the picture we

think we create, he was well content. Every now and then he would glance round at the other members, and note with quiet satisfaction what presentable fellows they all were. What dignity and traditions behind them! What a fine reserve! Thus argued his shy, hungry, but nevertheless thankful soul.

IV.

The great shock came with the annual meeting in October—he had just turned his seventy-first birthday—in the form of a report from the house committee. The Guelph was in financial straits. Rumours of this sort had been afloat about the Bloomington, but who ever thought of the Guelph? Not Pettigrew.

There was a hectic general gathering, which hurt him dreadfully. Members got up and said the committee was wasteful and didn't know its job. That was graceless. Another produced a wonderful menu from another club, which, he claimed, showed what was being done elsewhere, and at a profit, and was immediately asked to serve himself. He declined. Back and forth it went, while elderly gentlemen indulged in acrimonious repartee till it seemed to Pettigrew that the foundations of the world had shifted. Several thousand pounds were needed. An increase of dues and some private subscriptions could be reckoned on for part of this sum, but part only. When it was suggested that alliance with the Bloomington would solve the same difficulty for each, the meeting broke up in some confusion.

Pettigrew could not eat that night, and felt conscious of his heart. His food tasted like ashes. The waiters seemed strangely indifferent to what they must have known about; the chief steward as bland and punctilious as ever. But underneath it all Pettigrew knew that this substantial edifice was tottering. An increase of fees meant a decrease in membership. Several men had pointed that out. An alternative was the admission of a lot of new members. Where were these to be found? And what a change it would make in the club!

There may have been others who went home asking themselves 'What can I do?' At any rate, that is how it was with Pettigrew. He sat in his back room, put his chin in his hands and thought. What *could* he do? All so decent, and, in a way, kind. They would not have left him so much alone had they not thought he wanted to be left. Forty years now he had been receiving. Beyond the Christmas fund for the servants and paying of dues he had done nothing. Forty warm, comfortable years. He didn't know that by dining and lunching at the club every day of his life he had done more than any man in it. All he could see was that every day of his life the committee—and what good fellows they were!—and the club had been there at his service.

Then, suddenly, the idea came. If his heart had been strained that afternoon—and he felt that it had—he might be able to leave something to the club funds.

v.

He surprised the specialist by turning up in the consulting-room next morning, and was received in the most friendly manner. They were making about the same weather of it, and eyed each other with a certain interest. Pettigrew twirled his stick, and asked to be overhauled. 'Everything has gone well till yesterday,' he said, 'when I had a bit of a shock, and have been feeling it since. So I'd like to know if you have any cause to alter your last opinion.'

There was a brief, highly-skilled examination, and a looking-up of records.

'No,' said the great man; 'on the contrary, I find you in better shape than before. No harm done. You've taken very good care of yourself.'

'I've done all you said.'

'Evidently. On the strength of it I'll give you another three years. That is,' the specialist added with a grave smile, 'if you want them.'

Pettigrew changed colour and did not answer. The great man's eyes softened a little. He liked Pettigrew. The gaze of the latter became a little dim. He took out his pocket-book.

'How often have you been here?' he heard.

'Once a year for five years, Sir John.'

'H'm—yes—curiously enough we're rather alike in the matter of hearts. Mine has kept step pretty much with yours so far, but now you're ahead. However, it will work out the same way with both of us ultimately. Continue to avoid exertion, and you've nothing to fear for several years. Thank you, no fee this morning. I can really do nothing more for you. In fact,' he added curiously, 'I wonder a little why you came.'

Pettigrew didn't tell him, and went out.

'Charming man, that,' he said to himself, walking slowly toward Oxford Street to get a Park Lane bus.

Half-way there, he turned and went back to his room. He thought he saw an opportunity.

The reprieve gave him, say, another six years to live—but on a hundred and fifty a year. That meant resigning from the Guelph. The mere idea of this stunned him. Without the club he was a nonentity, a bit of human flotsam with no anchorage. This certainty worried him as a terrier worries a rat, and in his agitated mind the Guelph loomed like a palace. Six years in a single room. He licked his dry lips, and went there, blindly.

Ages since he had seen it at noontime. It looked drab, mean, comfortless—a hole to hide one's head in. He could live in the country on what he now had, but that meant banishment. Tragedy enfolded him. His mind

pitched back—back. Nothing to fasten on in the last forty years. One just like another; so much alike that they ran together in a sort of meaningless trickle. Had he been selfish and thought only of himself? Probably. Did he really want that reprieve and another six?

He sat for a long time, his heart pumping and fluttering, while he weighed the alternative. Something for the club? Something done in such a fashion that other members could not escape knowing him, or, at any rate, knowing his name? Another six years, Sir John had allowed him, 'if he wanted them.' Perhaps, after all, he didn't. Was it likely that any one would talk to him after nearly half a century of silence? Hardly.

He put his drawn, little face between his hands and surrendered to a truth inflexibly excluded for the greater part of his life. He was lonely. Horribly and damnably lonely. He had bluffed himself with the Guelph and make-believe. His pride in his appearance—bluff! His solitary little meals—bluff! The trouser crease and white spats—bluff! The way he held up his chin and stuck out his chest in Piccadilly—bluff! He saw it all now, and, with it, the way out.

vi.

It is a provision of mercy that in times of ultimate stress there comes to some a moment of great calm in which the mind disassociates from the body, and one observes oneself with a detached clearness as being merely a vehicle for the performance of certain duties. So it was with Pettigrew. The calm ensued. His heart steadied a bit. He began to write.

One letter to his landlady, enclosing a cheque. Another to the fortnight-valet, also with a cheque. These were comparatively simple. Over the third he took a good deal of time, making several rough copies. It would be read aloud in committee, and he wanted to use suitable phraseology. When it was in the desired form, he consulted his passbook very carefully, and noted the balance, a shade over nine hundred pounds with accrued interest; wrote a third cheque, for twenty-five pounds, reckoning this to be sufficient if the thing were done very simply; and a fourth for the remainder of his estate. These two he put into the letter addressed to the secretary of the Guelph. The others he left in the middle of the table.

He took one glance round the room, dropped a spare shilling in the slot meter, and went downstairs. The day was warm and bright for October, so he carried his overcoat. Chin up, chest stuck out, he walked with a distinctly military bearing to the nearest pillar-box and dropped in the third letter.

That cheered him. No turning back now. He didn't dwell on himself, but on the club weathering its financial storm, and saved from

amalgamation with the Bloomington. He thought of the committee, the secretary's voice when he read the letter and fingered the two cheques. Of the tribute, of the subdued little gathering a day or two later, of the formal announcement on the notice-board, of what might be said at the next annual meeting. This—and a lot more.

Suddenly he saw that this, too, was all bluff. No reason in it for what he was going to do.

He was lonely—damned lonely. O God! but he was lonely!

A hundred yards down the Edgware Road a red bus rumbled southward, flanked and followed by a maze of other traffic. Little Pettigrew took a long breath, jammed on his hat, and dashed for it as fast and straight as he could.

The last thing he ever heard was the scream of a woman.

FLY-FISHING IN CHINA.

By 'FLEUR DE LYS.'

THE Chinese method of restocking their ponds and lakes every spring with quantities of fry, and then netting the waters remorselessly in winter, when they are at their lowest, tends to make fish numerous and small. Fortunately, however, netting in China is by no means so efficient as in Europe, and the people, being singularly conservative in habit, cling to their old-fashioned nets, which no doubt the fish—mostly of the intelligent carp type—have in the course of ages become educated to avoid.

There are no trout in Central China, but several kinds of fish rise well to the fly, and offer very much better sport than our own coarse fish.

An excellent little surface feeder is the knife-fish, so named from the thinness of the body. This *Hemiculter leucisculus* is a delicate-looking little fellow, green above and silvery beneath, runs six to eight inches long, and swims near the surface in shoals. It is very active and lively, and takes a small trout-fly with pleasing readiness, rising with a splash like a burn trout. Knife-fish feed freely in the evenings on shallows close to the banks of lakes. The angler has no difficulty in selecting good places to fish from, as the little fish advertise themselves freely, splashing about at the surface in their hunt for insects. The larger ones are too heavy to flick out with a light trout-rod, but have to be drawn to the side and lifted gently ashore. Any small flies will serve: I find a hackle blue upright and a blue hackle with yellow body good killing patterns. The fish are quite nice to eat if fried crisp and brown, and served very hot. One of the charms of fishing for these little knife-fish is that, as the afternoon wears on, you will see the wakes of much larger fish as they circle over the shallows. If the tail fly is dropped ahead of one of those tracks it is very likely to be taken, and then instead of dragging a knife-fish ashore, one finds oneself engaged with bending rod in meeting the struggles of something lively and strong. When got ashore the fish will prove to be a handsome, slender carp with red fins, of half or three-

quarters of a pound. I have also taken another carp on the fly, which, I think, is merely the common *Cyprinus carpio*.

Nearly every Chinese pond holds murrel (*Ophiocephalus*). These are ugly predaceous brutes, with broad, flattened heads, and mouths full of teeth. The Chinese catch them by dapping with a frog attached to a long stiff bamboo. The frog is dabbled up and down on the weeds and water-lilies. I have often caught murrel this way, using a dropper tackle with a lead in the frog's mouth, and the hind-legs tied with a bit of cotton to the gut above the hook. A strong flip with finger and thumb at the top of the head is perhaps the kindest and quickest way of killing the frog before baiting. The Chinese only dabble the frog at the top of the water, but I find that with the dropper tackle it is often taken if worked with a sink-and-draw motion in holes among weeds. A small carp live-bait is also very effective for murrel; but there is a much more sporting way of taking these fish, and that is with a large fly, such as one would use for chub. The fly is cast into the clear lanes of open water among weeds, and, the murrel having been hooked, it is well to hustle him out at once, or he will bury himself in some mass of vegetation. If thick gut is used, it will not often be cut, for pond murrel do not run over three pounds. With river murrel, which get very much larger, gut is not safe, and I have often had even the thickest salmon gut severed by the formidable teeth of large specimens.

I have left nearly to the last a fish which has afforded me really magnificent sport. This is a large silvery fellow, shaped much like a sea-trout, which I believe to be *Elopichthys*, though I am not quite certain as to this being the correct identification. This fish is found in lakes, and after heavy rain goes to the mouths of streams running into pools, in order to feed on fry. In these currents of dirty, fast-running water it takes a fly freely. I find a long-shaped, but comparatively light fly, with two hooks set Stewart fashion one behind the other, very effective. The fly should be sunk well and worked very slowly against the current. The

fish make a sort of underwater swirl when taking, though sometimes one also sees them come up at the fly with a plunge. These fish have no teeth, but their mouths are very bony, and a large number get off while being poned. One evening in an hour's fishing I hooked six, four of which got off. The two I got out were, I think, the best of the lot; anyhow, they weighed five pounds each, and gave me a tremendous fight on my little $9\frac{1}{2}$ feet split-bamboo trout-rod. One of them got out sixty yards of line in one of his rushes. The largest I have caught so far has been seven and a quarter pounds. This fish also got out a lot of line at one time, and took a long time to play out; it gave, in fact, about the same amount of sport as a salmon of the same size. Unfortunately, these *Elopichthys* can be fished for successfully only when water is running into a lake, and when it would be considered too dirty at home even for minnow.

When the water is clear they nearly always come short at the fly. They must be fish with extraordinary eyesight to take the fly in such thick water.

In fast-running clear streams there is yet another Chinese fish which rises well to the fly. This is the so-called Rainbow Carp (*Opsariichthys bidens*), which has acquired its trivial name on account of its bright colouring during the spawning season. It runs up to at least three-quarters of a pound. The fly-fisher in China will be agreeably surprised at the activity and strength of the half and three-quarter pound carp which he catches on the fly. Those who have fly-fished for dace at home find the half-pounders very placid and lethargic as compared with trout: the slender Chinese carp are very different when hooked, and, though they do not jump, yet they give quite as much trouble as trout of similar calibre.

PERIL IN ADEN.

By J. BLAKE.

I.

A SMILING eager-voiced Arab boatman took me ashore; a serious-looking Somali who spoke English was my taxi-driver; an attentive Parsee supplied my little wants, including a worm-eaten guide entitled *Three Hours in Aden*. I was then told that I could not leave without seeing the famous 'Tanks,' which every one who landed at Aden went to see. Accordingly, I was whisked off in an old Ford, past heaps of coal stacked along the seashore; through a little gorge in the hillside—a run along the sea beach with a rocky, gray-coloured hill on the right named 'Shum Shum'—a winding climb to a gorge cut through the hill, with the cheerful local appellation of 'Hell's Gates'—out into a small plain, in the foreground of which spread out a small Arab town bearing the appropriate name of 'Crater'—a short drive through squalid streets, and the driver pulled up at the foot of the 'Tanks.'

In the course of a year thousands of visitors must run round Aden, see the 'Tanks,' and get back for the next meal on board ship without anything out of the ordinary happening to them. Still, for that short time at least, they are in a community of lawless people, controlled only by the strong hand of a civilised Power. There are large numbers of Somalis who have fled to Aden as a refuge from their enemies across in Africa; there are Indians forming the garrison of the place; Jews, Parsees, some pearl traders, big game hunters, who make Aden their headquarters; a sprinkling of Europeans, there only for purposes of trade, and a few others for various curious reasons of their own.

There could not but be stirring incidents in a place so filled with a restless and adventurous population. Nevertheless, thanks to British law and order, out of the thousands of passengers who land, probably not one has any experience out of the usual. Such, I felt, with an unreasonable dissatisfaction at the prospect, would likely be my fate.

The 'Tanks' are situated in a narrow valley in the bare, rocky hills. They consist of a series of reservoirs constructed by building walls across the valley at convenient intervals, usually at no great distance from one another. In fact, in the case of those towards the top, the water from one tank overflows directly into that below. The lowest is the largest of all, and has rarely been known to overflow. Normally the valley is absolutely dry, and there are no springs to fill the tanks. Only on those rare occasions when there is rain is there any water on the barren hillsides. Engineers have ingeniously constructed a series of drains which, when it does rain, trap almost every drop of water that falls on the steep sides of the little valley.

There had been one of those rare falls of rain recently, and looking up from where I was, I could see the series of walls across the valley leading up to quite precipitous heights, down which the water was busily rushing, filling the restricted space with an impressive roar.

II.

Having explored the more accessible parts in company with a motley crowd of Arabs, Jews, Somalis, and a sprinkling of passengers of various ships, I noticed a thin stream of people

who climbed up a steep path leading to the upper tanks. The desire to get out of the crowd and to fill up the time still on my hands led me to join the climbing few.

A dozen or so Arabs overtook me, climbing as if in haste, and soon disappeared round a spur. Knowing the Arab character and its easy excitement over anything new, I concluded that, as likely as not, beyond a desire to see a novel sight, they had no particular reason for haste, and my own progress continued to be leisurely, especially over one or two bits which were rather nasty for any one not going barefooted.

It seems strange to me now that I undertook that climb to the upper tanks. There was nothing very impressive that I expected to see. The bare hillsides, over which the sun had already set, formed a most depressing and uninviting scene. I remember I was in one of those unsatisfactory moods which come over us at times. I told myself nothing would ever happen to me again. All the stirring events of my life were in the past, and I must be content with an uneventful future. Everything would go according to programme. I would get to the top, then hurry down and catch my unpaid taxi back to the ship, and by 8 p.m. would be dining alongside the lady going back to New Zealand with a family of five.

I was getting quite bitter about the dullness of life when a large stone clattered down the hillside and shot past my face into the valley below. I looked up. There was nothing to be seen. The bare sides of the hill slightly overhanging the track at this point, and I concluded that the stone had been accidentally dislodged by some one passing along a path above me.

A short distance farther on I found I had reached the highest point of the path, and was now looking towards the highest tank, into which the water was directed from all sides of the steep hill around. I halted here for some time. The tanks as seen from this point made a curious sight. They were connected with one another by a series of falls of muddy water. I noticed the upper tanks were placed at very short intervals down the ravine. In fact, as I have said, in the first few from the top the water overflowing from the upper tanks produced waterfalls dropping directly into those below. Lower down, the space between the tanks gradually increased, and the water could be seen gleaming in stretches of steep sloping channels connecting one with another.

All sight-seers, except a couple of Parsees, had already gone. I was surprised not to see the Arabs who had overtaken me on the way up, as they had not passed me on their way down, and they were not visible on the last bit of track leading down to the topmost tank. This confirmed me in my theory of a path above me, along which they had probably returned. On

my inquiring from one of the Parsees if this were so, he replied in English, 'Yes; an upper path comes down round that curve.'

'Is it a better path to go back by?' I asked.

'By no means,' he replied. 'In fact, so far as I am aware, it is entirely disused, and no one would think of using it unless he wished to avoid being seen.'

I then told him of the falling stone. He looked grave.

'I should not go any farther,' he said. 'This place has before now been the scene of robbery and murder. It has a bad name among us, and we never venture up here alone. Come back with us.'

'Not after coming so far,' I protested. 'Besides,' I said, with a laugh, 'I am doomed to a humdrum life. Nothing ever happens to me now.'

After some further efforts to persuade me the Parsees hurried away, advising me, at least, to waste no more time than was necessary, as the sun had already sunk and darkness would follow swiftly.

III.

I then started on the climb down, and had almost reached the topmost tank when, looking up the way I had come, I saw that a group of Arabs had come round the curve which the Parsee had pointed out to me. A glance made me sure that their intentions towards me were hostile. They were all armed with formidable daggers, which stood out from their belts at the angle affected hereabouts by the desert camel-men. On seeing me they gesticulated threateningly, and shouted out something in Arabic, while two of them ran down the path the Parsees had taken, evidently with the intention of guarding against the possible arrival of new-comers from that side. Seeing that I did not appear to understand, one of them called to me in English, 'Halt!' At the same time two or three rushed down the path towards me, brandishing their weapons.

Although it was now plain that robbery or murder was what I was threatened with, I still remember having a curious conviction that I was bound to come out of this without anything very serious happening to me. Without taking any apparent notice of the Arabs I continued my progress to the brink of the tank, with the full expectation of finding a way by which I could escape. I was disappointed.

The hillside came down steeply on two sides of the tank, showing no signs of a possible track for escape. Another side was bounded by the wall of the half-full tank. Through an opening in this wall, about five feet from the top, the water rushed into the tank below, leaving the water of the tank at such a level below the top of the wall that it would be impossible for me to swim out and scramble to the top.

The remaining side was that down which I had come.

I was completely cut off. The Arabs were rushing down the only path out of this place, and there seemed nothing for me to do but to face them, and make a stand with my back to one of the steep sides.

Desperately I looked round once more, and my eye caught something which promised a means of escape.

The wall of the tank rose some five feet above the level of the water, and at one end, almost hidden by a projection of the hillside, I caught a glimpse of a rope-ladder dangling into the water. It seemed only a few strokes away, so without pausing to lighten myself of any of my clothes, I plunged into the tank and struck out for the ladder. I had, however, not counted on the strong current which flowed to the opening in the wall and thence fell into the next tank, some thirty feet below. It was only with a severe struggle that I managed to reach the ladder and clamber up to the top of the wall.

Looking over, I saw directly below me a rough track, apparently for the use of workmen, leading down one side of the hill to a similar tank below. I hurriedly pulled up the ladder and lowered it down the opposite side towards this track. Then I cautiously descended the face of the wall. As my head came level with the top of the wall, I had the satisfaction of seeing the first Arabs rush up to the brink of the tank and cry out in disappointment. One of them threw a knife at me just too late; the blade hit the top of the wall with a clang, and then I heard it plump into the tank below me.

IV.

I now seemed to have escaped after all. As I came to the last rung of the ladder and felt for the track below, which I believed led to safety, I once more began to think of the comparative ease with which I had got away. I should get back after an ignominious chase and a ducking. My old feeling of bitterness at the want of adventure in my life began to return. I determined not to hurry. It seemed to me waste of time. As my foot touched the track I heard a loud splash below me, and hurriedly turned round to face the sound.

Below me, clambering out of the lower tank, was an Arab. He had apparently made use of the current I had resisted and dived through the opening, out of which the water fell into the tank below. As soon as he was out of the tank, he drew a dagger and advanced a short distance up the track down which I must go if I hoped to escape. He stopped at a place where the track practically disappeared, down which it would be necessary for me to clamber with my back towards him.

For a moment I thought of taking a running

leap at him. A second glance showed this to be a hopeless plan. The farthest point I could hope to reach was an irregular slope just in front of him, which would certainly throw me on my face. On the other hand, the moment I started to climb down he would of course advance, and have my back at the mercy of his knife.

He was now standing half-way up the track between the two tanks. Behind me I could hear, above the sound of water falling from the upper to the lower tanks, the shouts of the remaining Arabs, who might any moment discover some means of getting over the wall behind me.

Then a means of escape occurred to me. I would escape in the same way as the Arab had cut me off. On my right was a sheer fall into the lower tank, which, as I have already described, overflowed in its turn into another below. Whether the third tank was as deep as the two upper ones, of course, I had no idea.

I advanced boldly down the track as if to make a desperate attempt to pass him. As soon as I reached the top of the steep incline below which he was waiting I turned sharply to the right and plunged headlong into the lower pool. As I rose I felt the strong current draw me to the outlet.

Drawn onwards, I could only think of what was at the foot of the falls. The next instant I felt myself shoot out into the open. I had a moment's glimpse of the distant town at a great depth below me. Fortunately it was a small fall, as I fell anyhow with a resounding smack into the third tank. I struggled out of the water as fast as I could, and once more struck the path leading down to the tanks below.

Looking back, I saw the Arab preparing to follow me by the track leading down from above.

Then came a nightmare race down that awful path. My pursuer soon found I was gaining on him, and determined to repeat his bold dive to get ahead of me. As I approached the fifth or sixth tank I looked back. He was not to be seen. Next instant I saw a dark object shoot out from the outlet through which the water was falling from the upper tank, and my pursuer fell, to be dashed to death on the cement channel which received the fall near this tank. A moment later his body was swept across the surface of the tank into the one below.

When eventually I reached the foot of that valley I found his body had reached there before me.

I am still rather vague as to what happened after that, until I found myself climbing up the gangway, thinking in a confused way that my three hours in Aden had, at least, given me enough incident to remove temporarily my dissatisfaction with the ordinary routine of a quiet life.

THE DARTMOOR VET.

A CHARACTER SKETCH.

By BEATRICE CHASE.

I.

ON Easter Sunday morning I woke at half-past five, to find my poor little Tiger Puss Puss dying on the foot of my bed. He had retired overnight apparently quite well, and the shock was indescribable.

I jumped up and spoke to him, but he made no response. He seemed to be semi-unconscious. There was no apparent pain nor any symptom except very rapid breathing and a comatose condition. It was a revelation when no responsive purr greeted my gentle stroking.

I dressed quickly, and went over to the blue-jackets' cottage and routed out Jack Loftus. He came over, looked at Tiger, who worships him, and could offer no suggestion.

I sent a telephone message to the vet as soon as the office opened at 8 A.M. and waited, trembling, for the reply. I had never seen the vet. I did not even know if he would condescend to attend poor, ordinary little cats. London vets do, of course, but vets in this country are concerned chiefly with farm stock and horses. And this man, the nearest, is ten miles off.

The answer was depressing. Mr Bird was very sorry, but he had an urgent case of a valuable pedigree dog, fifteen miles the other side of his home, and was unable to say when he could attend Tiger.

Of course, one could not expect my common English tom-cat to take precedence of a valuable dog, so I returned to the poor mite feeling more down than ever.

Without unduly disturbing him I succeeded in taking an under-arm temperature. It was 108, which terrified me. I did not then know that a cat's normal temperature is 102. His pulse was too quick to count at all.

I sat beside him at intervals till eleven o'clock, when I was called down by the door-bell, it being the bluejacket's stand-easy time.

On the step stood one of the smartest-looking men I ever saw. He had iron-gray hair, the gray that suggests powder, and was most expensively dressed in typical country rig, including an inch-thick double-breasted overcoat, a beautiful Jaeger scarf, and handsome stout boots with leggings. He was the picture of the country squire dressed for the part.

I stared at him, amazed, as he saluted smartly.

'Good-morning, madam. I had a call to see a sick cat.'

This radiant stranger was the vet, poor Tiger's

doctor! My relief was such that I could have hugged him.

II.

I asked him in, warned him to tread lightly, because ever since his trapping Tiger has been terrified of the sound of a man's footstep, and took him up to where the little patient was still on the foot of my bed. I had been afraid to lift or touch him.

Tiger still took no notice—a bad sign, for, ordinarily, he swears like a little viper at a strange man.

The vet sat down and looked at him.

'Has he been sick? No? Can you account for it at all? Was he all right at bedtime? Are any of the neighbouring cats ill?'

I noticed that, while talking, his eyes were never off the patient.

Then he lapsed into silence for a time, still watching intently.

'It's chest trouble, I reckon,' he said at last, thoughtfully. 'Heart or lungs. He is sickening for something. We have never had so much "flu" among cats in my memory. And a month or so ago, there was "sleeping sickness" among them all over the west of England.'

'Oh, surely it isn't that?' I exclaimed in agony.

'No, no. I don't think so. I'll soon tell 'ee,' he answered soothingly, producing from his breast-pocket a dainty little stethoscope.

He rose, came close to the bed, adjusted the ear-pieces, and put the nozzle softly on one of the little striped sides. Tiger took no notice. The vet worked gently all over his sides and the front of his throat and chest, and then removed the instrument, and sat down without speaking for a minute.

'What do you think it is?' I faltered.

'It's pericarditis—inflammation of the heart, you know—and I am afraid there is valve trouble too, but I can't tell that yet, not till the action is quieter. He has got a very rapid pulse. And there is some inflammation in the left lung and a touch of bronchitis.'

'My poor little Tiger!'

'Yes. He is very ill, but I hope we shall pull him through. He will want a lot of nursing.'

'I shall do nothing else,' I said, chokingly. 'I sha'n't leave him at all day or night. What treatment do you wish?'

The vet produced a small bottle from another pocket. He had come prepared.

'I want five drops of this mixture given to him every two hours. Have you a minim glass?'

Yes. Well, drop it from that into a small spoon—an egg-spoon is best—and you open his mouth and let some one else slip the drops in at one corner near the throat. Don't administer medicine from the front, ever. They are apt to shake it out. Put it in at the corner of the mouth near the throat and they are sure to swallow. Don't hold his head too high to make swallowing difficult. Just in a natural, easy position. Cats are very difficult patients. They don't trust mankind as dogs do. Cats, they go off into a world of their own when there is trouble. They like to fend for themselves. Well, and you must give him inhalation of Friar's balsam in boiling water. One of they oil-stoves with a kettle on it near the bed, or a little below it so's the steam can rise. And he must have a linseed poultice every six hours. And put a piece of flannel round after you take it off to prevent chill. The poultice must go each side just in his armpits. That's all you can do for the next twenty-four hours.'

My heart sank as he rose to go. He was so kind, so competent, and lived so far away, that I mentally clung to him. It was then only noon, with many long daylight hours to live through, and after them the endless dark night, when I should be alone with the poor pathetic little heap of suffering.

'I will come to-morrow,' went on the vet, with his eyes fixed still on the patient.

'It's bank holiday,' I faltered.

He looked at me keenly. 'Be you going away?'

'I? Good gracious, no! I never go trips; and, in any case, I wouldn't leave Tiger. I thought you might be glad of a day off.'

He gave a short laugh.

'We don't get much off-time in my job; no, and don't want it neither, if there's a sick beast about. I shouldn't care about pleasuring if I was leaving a dumb thing in pain. Well, madam, they drops are the best stuff in the Pharmacopœia. They'm a patent, and they'll keep the throat open and take down inflammation where nothing else will. Between you and I, I've taken them myself many a time and given them to my wife. Last week I went to bed one night with such a sore throat I didn't know how to speak or swallow, and woke up quite well in the morning. They are an American mixture.'

He was making his way back to the door during this conversation. I hated to let him out of the place.

'You will be sure to come in the morning, won't you? You see, I can't 'phone to-day or to-morrow after ten, as it's closing hours. It couldn't have happened at a more awkward time.'

He turned and gave me a searching look. He seemed to look right through everyone and everything, and his manner had a charming

imperiousness, as if he never met with anything but unquestioning obedience.

'I will be sure to come,' he assured me.

'And what about the dog?' I asked, suddenly remembering. 'It is more than good of you to come here so early in the day. I didn't expect you till the afternoon. You haven't been to the dog yet, have you?'

'No, fey. He's twenty miles from here, more.'

'I can't ever thank you for being so prompt. And my poor little thing isn't a valuable animal in any way.'

'There's values and values, madam,' he answered, running down the steps.

III.

I listened to the sound of his engine starting, and then returned to my little patient, who still was immovable. Jack Loftus lurched in at once to know the verdict, and I commandeered him to administer the drops. He has beautiful hands, and is very gentle and clever with flowers and animals.

We managed very well. Tiger was too ill to make much fuss, and he swallowed them without difficulty.

Then we set about the inhalation. I always keep Friar's balsam in stock, but there was no linseed-meal, and all the distant shops were shut. The bluejacket cast himself into this breech, inquired at both farms with no success, and then sallied forth to scour the neighbourhood. He returned in under an hour with a small tinful, very damp and mouldy, but better than nothing till I could somehow procure more from somewhere.

When I applied the first poultice, for a few seconds there was a tiny purr of relief.

So the day dragged on. Jack Loftus came the last thing at night to help me with the drops again, and said he would look in about midnight and at 4 A.M.

That is Jack. He will do those mad, wonderful things for any one or anything in trouble, and doesn't even want it mentioned.

There was no change by morning. The faithful vet arrived at exactly the same hour. Again he walked in, sat down and watched the patient. Then came the sounding and the report 'No change.'

'He's no worse and no better, madam. The thing must take its course till the crisis. You can only carry on with the same treatment.'

I thanked him, and as he was leaving he seemed to read my thoughts, for he turned, gave me one of his searching glances, and said, 'Now, the days and nights seem very long, and I seem very far away.'

He paused, and I struggled with a lump in my throat.

'I wish I was nearer, and I would look in every evening at bedtime. But, as I can't, you

send one of your men over and ring me up, any time, *any time*, day or night, and tell me anything or ask anything.'

And he plunged out in the same frantic hurry to dodge my thanks.

I heard during the day that he had taken the trouble to go to the post-office and warn them that, whatever hour of the day or night I wished to get through to him, they were to manage it, regardless of closing times.

IV.

That day and night dragged on like the previous ones. But by Easter Tuesday morning the poor mite seemed to be much weaker. He had taken no food or drink, not even one drop of milk since the Saturday.

The vet reported punctually on the Tuesday morning. He sat a long time in silence after the examination.

'He is very ill—very ill,' he said at last. 'But I don't think we can do anything more. I wish he would cough. Has he coughed at all?'

'Not once.'

'It's curious,' he said reflectively. 'His bronchial tubes are choked, and it would relieve his breathing if he would cough, and clear some of the mucus. Well, we can't make him. Carry on, madam, and hope for the best.'

By that evening I was too spent to watch again, so Jack Loftus agreed to come in here for the night and sit up with Tiger.

We had the fire lighted in the sunshine room, plenty of coal laid in, and I carried Tiger down on a cushion and put him in his favourite chair before the fire.

The bluejacket arrived at 10 P.M. in a huge pea-coat, and a most cheerful mood, remarking with a twinkle that he had kept many a dog-watch in his day, but this was the first cat-watch. No, he wouldn't take any refreshment; he didn't want any means of making tea or cocoa during the night. He would lie on the rug before the fire. He did not want a lamp or a book. He would administer the drops regularly, and call me if there was any change. All he asked was leave to go outside for ten minutes at 2 A.M. and smoke a pipe.

Of course I was wretched at leaving Tiger, fearing he would be gone by morning, but the bluejacket was most cheerful.

'Don't you worry, miss. He's worth a hundred dead cats now.'

So I left him, but had hardly reached my room before an amazing thing happened. I heard a call from Jack, ran to the stairs, and there was Tiger at the foot. He had crawled off his cushion and to the staircase, and was too weak to mount, but looked up at me, dumbly asking to be carried. I ran down, lifted him up, and took him back to my bed, where he lay down with an appearance of contentment. This

was a problem. I could not risk moving him again, and apparently he was not happy away from me. Finally I asked Jack if he would stay warm by the fire, and come up to my room and give the drops every two hours if I lay down in my dressing-gown for some sleep.

This was done, and at 3 A.M., as things were unchanged and I had had some sleep, I asked Jack to go off to bed, which he did. At 5.30, while I was alone, to my horror Tiger crawled somehow off the bed and tottered to my wash-stand, creeping underneath.

That I knew was the end. I had heard how animals creep under things to die.

I stood in agony, praying that it might soon be over, when, to my amazement, Tiger crawled out and crossed the room. He was so weak he kept falling over, but he went to a wall, crouched down by it, and put his little paws up the wall, patting as if he were by a rat or rabbit hole. The awful truth rushed over me. He was delirious from fever and want of food and sleep. He looked up at me at intervals, with bright eyes and enormous pupils, and kept feeling about the wall for a hole.

Fearing he was going mad, I fled over to the cottage, roused another bluejacket, and asked him to 'phone to the vet saying what was happening. Then I returned to Tiger, who was still trying to chase imaginary prey.

At about eight he crawled back to the bed, asking me to lift him up, which I did, and he subsided. I found his temperature was lower and his breathing seemed easier.

The vet arrived at 9 A.M., looking very worried.

'He is better,' I said, in greeting. 'But, for a bit, he was absolutely off his head.'

Mr Bird sighed with relief.

'Well, I brought a bromide injection. But he won't want it now.'

'Bromide? Do vets use that, and hypodermically?'

'Yes, fey. We use it a lot for bulls. Bulls be rather subject to meningitis, and I was once called to a very bad case. I gave him chloral and bromide, and bled him, and gave him cold water applications to the head, and we pulled him through.'

Then he examined Tiger, and pronounced him to be out of danger, provided we could combat the reaction and the stage of exhaustion and weakness. 'You must give him Brand's beef jelly in a spoon, and a little milk in a spoon. His strength must be kept up now.'

Then he sounded him, and to my intense relief said that the valve trouble in the heart had been only functional and had subsided.

V.

Next day, which was bright and sunny, poor Tiger seemed at his very lowest. I telephoned

in despair, and received the amazing order to wrap him in a warm shawl and carry him out into the sun for half-an-hour.

It seemed insane, but I did.

The poor little thing shivered the whole time from exhaustion, but his delicate little nostrils worked and quivered as if he enjoyed the freshness after the stuffy house and the sickly-sweet inhaling. When I carried him back he slept profoundly.

From the following day all danger was over, and then the convalescence problem began. I noticed the same thing at every visit—that the vet would converse and tell stories about his patients and experiences always with his eyes on Tiger, and that he stopped in the middle of a sentence if Tiger moved so much as an ear.

Also, the man never seemed to be in a hurry. He would spend any length of time sitting, talking and watching. After a bit I commented on this, and he answered: 'Yes; you see with us the main thing is diagnosis. You can't come in and lay a horse on the table and say, "Now, tell me where you feel it." You have got to watch till you see yourself where he feels it. 'Tis the same with all dumb things. They can't tell you anything, so you have to know how to find it out; and you don't have to make no mistake neither. Once I was called to a valuable Pekingese with what they said was chronic colic. I watched for a day or so—a day or so!—and decided the symptoms pointed more to obstruction. I asked to X-ray the little thing, and we found a stone inside it. It had swallowed a stone while playing. Folk shouldn't throw stones for dogs to pick up. It's a fool trick. Well, I asked for one of the operating vets from London, and he came, and we removed the stone. Once a cat was brought to me with a queer throat symptom. They thought it was diphtheria. I kept it under observation and decided to operate. I did, and found a needle in one of its neck glands. Chloroform? Oh, we live on it, I reckon. A vet is never without his chloroform bottle. We give it for almost everything. I have a complete set of chloroform masks for each different sort of animal—horses, cats, dogs. A horse takes two ounces to send him to sleep. No, they aren't sick after it. Don't feel it a bit. Well, I want to give your little treasure some quinine pills as soon as he eats any solid food. Only one pill a day, madam, in his meat. It may make him buzzy in the head if you give more.'

To watch and listen to that man was a liberal education. His kindness, his patience, his sagacity, his chivalry to weak, dumb, and helpless things! I should think the vet is born, not made, though I was thrilled to find that his training includes a knowledge of French and Scripture among other subjects.

VI.

His funniest story was as follows. I wish I could have had it produced on the gramophone to give the voice and Devon dialect:

A distracted farmer once went to him beseeching immediate help for a whole squad of valuable poisoned ponies. The poor owner drew a lurid picture of their condition, and the vet hurried back with him to his orchard, where the patients were all collected. Some were lying down, too ill to rise. Others were staggering about, and some were leaning weakly against supports.

'There they be, the whole lot,' moaned the farmer. 'And who could ha' done it beats me. I didn't know I had an enemy in the world.'

The vet diagnosed in a flash and had a little game. 'And how do 'ee know they 'm poisoned?' he asked.

'Why, man, look at 'en,' shouted the exasperated farmer.

'I be looking at 'en, and they 'm only what I've seen you more than once.'

The farmer stared, dazed. 'What do 'ee mean?'

'They 'm only what I've seen you,' repeated the vet, 'and that's tight.'

'What do 'ee mean? I've never been tight?'

'Oh, haven't you?' said Mr Bird innocently. 'Well, your ponies are, if you never have been.'

The farmer stared as if he thought the vet had gone mad. 'Drunk? But who's gived 'en drink?'

'Apples, man, apples. Do 'ee know that fresh apples will make horses so drunk as a lord?'

Then he turned to vigorously, and in a short time had most of the ponies on their hooves again. I am muddled as to that treatment. I think it was an emetic and the inevitable drench.

The day he paid his last visit and said good-bye was a day of real sadness. But Tiger was too well to need further care.

I felt to have lost a rare friend. Never in any trouble have I had such *sympathetic* kindness. Without a word from me, he understood all that Tiger is to me. When departing, he confided to me that from the first he had had no real hope of saving the patient, and every time his telephone bell rang, day or night, for three days, he said to his sons, 'That's to say Tiger is gone.' I have never known any doctor, however kind, who cared for his patient as that vet cared for Tiger to every tiny detail, and when my time comes to fight for my life, I wish I may be in the care of such a man.

Animals have a terrible lot of suffering, but if this man is, as I hope, a typical vet, they also have their compensations.

SEVENTH SERIES

JOHN MACNAB: A COMEDY FOR POACHERS.

By JOHN BUCHAN, Author of *John Burnet of Barns*, *Greenmantle*, &c.

CHAPTER I.—IN WHICH THREE GENTLEMEN CONFESS THEIR ENNUI.

THE great doctor stood on the hearth-rug looking down at his friend who sprawled before him in an easy-chair. It was a hot day in early July, and the windows were closed and the blinds half down to keep out the dust and the glare. The standing figure had bent shoulders, a massive clean-shaven face, and a keen interrogatory air, and might have passed his sixtieth birthday. He looked like a distinguished lawyer who would soon leave his practice for the Bench. But it was the man in the chair who was the lawyer, a man who had left forty behind him, but was still on the pleasant side of fifty.

'I tell you for the tenth time that there's nothing the matter with you.'

'And I tell you for the tenth time that I'm miserably ill.'

The doctor shrugged his shoulders. 'Then it's a mind diseased, to which I don't propose to minister. What do you say is wrong?'

'Simply what my housekeeper calls a "no-how" feeling.'

'It's clearly nothing physical. Your heart and lungs are sound. Your digestion's as good as anybody's can be in London in midsummer. Your nerves—well, I've tried all the stock tests, and they seem to be normal.'

'Oh, my nerves are all right,' said the other wearily.

'Your brain seems good enough, except for this dismal obsession that you are ill. I can find no earthly thing wrong, except that you're stale. I don't say run down, for that you're not. You're stale in mind. You want a holiday.'

'I don't. I may need one, but I don't want it. That's precisely the trouble. I used to be a glutton for holidays, and spent my leisure moments during term planning what I was going to do. Now there seems to be nothing in the world I want to do—neither work nor play.'

'Try fishing. You used to be keen.'

'I've killed all the salmon I mean to kill. I never want to look the ugly brutes in the face again.'

'Shooting?'

No. 733.—VOL. XV.

'Too easy and too dull.'

'A yacht.'

'Stop it, old fellow. Your catalogue of undesired delights only makes it worse. I tell you that there's nothing at this moment which has the slightest charm for me. I'm bored with my work, and I can't think of anything else of any kind for which I would cross the street. I don't even want to go into the country and sleep. It's been coming on for a long time—I dare say it's due somehow to the War—but when I was in office I didn't feel it so badly, for I was in a service and not my own master. Now I've nothing to do except to earn an enormous income, which I haven't any need for. Work comes rolling in—I've got retainers for nearly every solvent concern in this land—and all that happens is that I want to strangle my clerk and a few eminent solicitors. I don't care a tinker's curse for success, and, what is worse, I'm just as apathetic about the modest pleasures which used to enliven my life.'

'You may be more tired than you think.'

'I'm not tired at all.' The speaker rose from his chair, yawning, and walked to the window to stare into the airless street. He did not look tired, for his movements were alert, and, though his face had the slight pallor of his profession, his eye was clear and steady. He turned round suddenly.

'I tell you what I've got. It's what the Middle Ages suffered from—I read a book about it the other day—and it's called *tædium vitæ*. It's a special kind of ennui. I can diagnose my ailment well enough, and Shakespeare has the words for it. I've reached a point where I find "nothing left remarkable beneath the visiting moon."

'Then why do you come to me, if the trouble is not with your body?'

'Because you're *you*. I should come to you just the same if you were a vet, or a bone-setter, or a Christian Scientist. I want your advice, not as a fashionable consultant, but as an old friend and a wise man. It's a state of affairs that can't go on. What am I to do to get rid of this infernal disillusionment? I can't go through the rest of life dragging my wing.'

[All Rights Reserved.]

DECEMBER 13, 1924.

The doctor was smiling. 'If you ask my professional advice,' he said, 'I am bound to tell you that medical science has no suggestion to offer. If you consult me as a friend, I advise you to steal a horse in some part of the world where a horse-thief is usually hanged.'

The other considered. 'Pretty drastic prescription for a man who has been a Law Officer of the Crown.'

'I speak figuratively. You've got to rediscover the comforts of your life by losing them for a little. You have good food and all that sort of thing at your command—well, you ought to be in want for a bit, in order to appreciate them. You're secure and respected and rather eminent—well, somehow or other get under the weather. If you could induce the newspapers to accuse you of something shady and have the devil of a job to clear yourself it might do the business. The fact is, you've grown too competent. You need to be made to struggle for your life again—your life or your reputation. You have to find out the tonic of difficulty, and you can't find it in your profession. Therefore I say "steal a horse."'

A faint gleam appeared in the other's eyes. 'That sounds to me good sense. But, hang it all, it's utterly unpractical. I can't go looking for scrapes. I should feel like play-acting if in cold blood I got myself into difficulties, and I take it that the essence of your prescription is that I must feel desperately in earnest.'

'I'm not prescribing. Heaven forbid that I should advise a friend to look for trouble! I'm merely stating how in the abstract I regard your case.'

The patient rose to go. 'Miserable comforts are ye all,' he groaned. 'Well, it appears you can do nothing for me except to suggest the advisability of crime. I suppose it's no good trying to make you take a fee.'

The doctor shook his head. 'I wasn't altogether chaffing. Honestly, you would be the better of dropping for a month or two into another world—a harder one. A hand on a cattle-boat, for instance.'

Sir Edward Leithen sighed deeply as he turned from the doorstep down the long, hot street. He did not look behind him, or he would have seen another gentleman approach cautiously round the corner of a side street, and, when the coast was clear, ring the doctor's bell. Sir Edward was so completely fatigued with life that he neglected to be careful at crossings, as was his habit, and was all but slain by an omnibus. Everything seemed weary and over-familiar—the summer smell of town, the din of traffic, the panorama of faces, pretty women shopping, the occasional sight of a friend. Long ago, he reflected with disgust, there had been a time when he had enjoyed it all.

He found sanctuary at last in the shade and coolness of his club. He remembered that he

was dining out, and bade the porter telephone that he could not come, giving no reason. He remembered, too, that there was a division in the House that night, an important division advertised by a three-line whip. He declined to go near the place. At any rate, he would have the dim consolation of behaving badly. His clerk was probably at the moment hunting feverishly for him, for he had missed a consultation in the great Argentine bank case which was in the paper next morning. That also could slide. He wanted, nay, he was determined, to make a mess of that case.

Then he discovered that he was hungry, and that it was nearly the hour when a man may dine. 'I've only one positive feeling left,' he told himself, 'the satisfaction of my brute needs. Nice position for a gentleman and a Christian!'

There was one other man in the dining-room, sitting at the little table in the window. At first sight he had the look of an undergraduate; a Rugby Blue, perhaps, who had just come down from the university, for he had the broad, slightly-stooped shoulders of the football-player. He had a ruddy face, untidy sandy hair, and large, reflective gray eyes. It was those eyes which declared his age, for round them were the many fine wrinkles which come only from the passage of time.

'Hullo, John,' said Leithen. 'May I sit at your table?'

The other, whose name was Palliser-Yeates, nodded. 'You may certainly eat in my company, but I've got nothing to say to you, Ned. I'm feeling as dried-up as a dead starfish.'

They ate their meal in silence, and so pre-occupied was Sir Edward Leithen with his own affairs that it did not seem to him strange that Mr Palliser-Yeates, who was commonly a person of robust spirits and plentiful conversation, should have the air of a deaf-mute. When they had reached the fish, two other diners took their seats and waved them a greeting. One of them was a youth with lean, high-coloured cheeks, who limped slightly; the other a tallish, older man, with a long, dark face, a small, dark moustache, and a neat, pointed chin, which gave him something of the air of a hidalgo. He looked weary and glum, but his companion seemed to be in the best of tempers, for his laugh rang out in that empty place with a startling boyishness. Mr Palliser-Yeates looked up angrily, with a kind of shiver. 'Noisy brute, Archie Roylance!' he observed. 'I suppose he's above himself since Ascot. His horse won some beastly race, didn't it? It's a good thing to be young and an ass.'

There was that in his tone which roused Leithen from his apathy. He cast a sharp glance at the other's face. 'You're off colour?'

'No,' said the other brusquely. 'I'm perfectly fit. Only I'm getting old.'

This was food for wonder, inasmuch as Mr

Palliser-Yeates had a reputation for a more than youthful energy, and, although forty-five years of age, was still accustomed to do startling things on the Chamonix *aiguilles*. He was head of an eminent banking firm, and something of an authority on the aberrations of post-war finance.

A shade of sympathy came into Leithen's eyes. 'How does it take you?' he asked.

'I've lost zest. Everything seems more or less dust and ashes. When you suddenly wake up and find that you've come to regard your respectable colleagues as so many fidgety old women, and the job you've given your life to as an infernal squabble about trifles—why, you begin to wonder what's going to happen.'

'I suppose a holiday ought to happen.'

'The last thing I want. That's my complaint. I have no desire to do anything, work or play, and yet I'm not tired—only bored.'

Leithen's sympathy had become interest. 'Have you seen a doctor?'

The other hesitated. 'Yes,' he said at length. 'I saw old Acton Croke this afternoon. He was no earthly use. He advised me to go to Moscow and fix up a trade agreement. He thought that might make me content with my present lot.'

'He told me to steal a horse.'

Mr Palliser-Yeates stared in extreme surprise. 'You! Do you feel the same way? Have you been to Croke?'

'Three hours ago. I thought he talked good sense. He said I must get into a rougher life, so as to appreciate the blessings of the life that I'm fed up with. Probably he is right, but you can't take that sort of step in cold blood.'

Mr Palliser-Yeates assented. The fact of having found an associate in misfortune seemed to enliven slightly, very slightly, the spirits of both. From the adjoining table came, like an echo from a happier world, the ringing voice and hearty laughter of youth. Leithen jerked his head towards them.

'I would give a good deal for Archie's gusto,' he said. 'My sound right leg, for example. Or, if I couldn't get that, I'd like Charles Lamanha's insatiable ambition. If you want as much as he wants, you don't suffer from tedium.'

Palliser-Yeates looked at the gentleman in question, the tall dark one of the two diners. 'I'm not so sure. Perhaps he has got too much too easily. He has come on uncommon quick, you know, and, if you do that, there's apt to come a moment when you flag.'

Lord Lamanha—the title had no connection with Don Quixote and Spain, but was the name of a shieling in a Border glen which had been the home six centuries ago of the ancient house of Merkland—was an object of interest to many of his countrymen. The Marquis of Liddesdale, his father, was a hale old man who might

reasonably be expected to live for another ten years, and so prevent his son's career being compromised by a premature removal to the House of Lords. That son had a safe seat for a London division, was a member of the Cabinet, and had a reputation for the matter-of-fact oratory which has displaced the pre-war grandiloquence. People trusted him, because, in spite of his Hidalgo-ish appearance, he was believed to have that combination of candour and intelligence which England sighs for in her public men. Also he was popular, for his record in the War, and the rumour of a youth spent in adventurous travel, touched the imagination of the ordinary citizen. At the moment he was being talked of for a great Imperial post which was soon to become vacant, and there was gossip, in the alternative, of a ministerial readjustment which would make him the pivot of a controversial government. It was a remarkable position for a man in his early forties to have won, who had just entered public life with every disadvantage of birth.

'I suppose he's happy,' said Leithen. 'But I've always held that there was a chance of Charles kicking over the traces. I doubt if his ambition is an organic part of him, and not stuck on with pins. There's a fundamental daftness in all Merklands. I remember him at school.'

The two men finished their meal, and retired to the smoking-room, where they drank their coffee abstractedly. Each was thinking about the other, and wondering what light the other's case could shed on his own. The speculation gave each a faint glimmer of comfort.

Presently the voice of Sir Archibald Roylance was heard, and that ebullient young man flung himself down on a sofa beside Leithen, while Lord Lamanha selected a cigar. Sir Archie settled his game leg to his satisfaction, and filled an ancient pipe. 'Heavy weather,' he announced. 'I've been trying to cheer up old Charles, and it's been like castin' a fly against a thirty-mile gale. I can't make out what's come over him. Here's a deservin' lad like me strugglin' at the foot of the ladder and not cast down, and there's Charles high up on the top rungs as glum as an owl, and declarin' that the whole thing's foolishness. Shockin' spectacle for youth.'

Lamanha, who had found an arm-chair beside Palliser-Yeates, looked at the others, and smiled wryly.

'Is that true, Charles?' Leithen asked. 'Are you also feeling hipped? Because John and I have just been confessing to each other that we're more fed up with everything in this gay world than we've ever been before in our useful lives.'

Lamanha nodded. 'I don't know what has come over me. I couldn't face the House to-night, so I telephoned to Archie to come and

cheer me. I suppose I'm stale, but it's a new kind of staleness, for I'm perfectly fit in body, and I can't honestly say I feel weary in mind. It's simply that the light has gone out of the landscape. Nothing has any savour.'

These three men had been at school together. They had been contemporaries at the university, and close friends ever since. They had no secrets from each other. Leithen, into whose face and voice had come a genuine interest, gave a sketch of his own mood, and the diagnosis of the eminent consultant. Archie Roylance stared blankly from one to the other, as if some new thing had broken in upon his simple philosophy of life.

'You fellows beat me,' he cried. 'Here you are, every one of you a swell of sorts, with everything to make you cheerful, and you're grousin' like a labour battalion! You should be jolly well ashamed of yourselves. It's fairly temptin' Providence. What you want is a holiday and some hard exercise. Go and sweat ten hours a day on a steep hill, and you'll get rid of these notions.'

'My dear Archie,' said Leithen, 'your prescription is too crude. I used to be fond enough of sport, but I wouldn't stir a foot to catch a sixty-pound salmon or kill a fourteen pointer. I don't want to. I see no fun in it. I'm *blasé*. It's too easy.'

'Well, I'm dashed! You're the worst spoiled fellow I ever heard of, and a nice example to democracy.' Archie spoke as if his gods had been blasphemed.

'Democracy, anyhow, is a good example to us. I know now why workmen strike sometimes and can't give any reason. We're on strike—against our privileges.'

Archie was not listening. 'Too easy, you say?' he repeated. 'I call that pretty fair conceit. I've seen you miss birds often enough, old man.'

'Nevertheless it seems to me too easy. Everything has become too easy, both work and play.'

'You can screw up the difficulty, you know. Try shootin' with a twenty bore, or fishin' for salmon with a nine-foot rod and a dry-fly cast.'

'I don't want to kill anything,' said Palliser-Yeates. 'I don't see the fun of it.'

Archie was truly shocked. Then a light of reminiscence came into his eye. 'You remind me of poor old Jim Tarras,' he said thoughtfully.

There were no inquiries about Jim Tarras, so Archie volunteered further news.

'You remember Jim? He had a little place somewhere in Moray, and spent most of his time shootin' in East Africa. Poor chap, he went back there with Smuts in the War and perished of blackwater. Well, when his father died and he came home to settle down, he found it an uncommon dull job. So to enliven it he invented a new kind of sport. He knew all

there was to be known about *shikar*, and from trampin' about the Highlands he had a pretty accurate knowledge of the countryside. So he used to write to the owner of a deer-forest and present his compliments, and beg to inform him that between certain dates he proposed to kill one of his stags. When he had killed it he undertook to deliver it to the owner, for he wasn't a thief.'

'I call that poaching on the grand scale,' observed Palliser-Yeates.

'Wasn't it? Most of the fellows he wrote to accepted his challenge, and told him to come and do his damndest. Little Avington, I remember, turned on every man and boy about the place for three nights to watch the forest. Jim usually worked by night, you see. One or two curmudgeons talked of the police and prosecutin' him, but public opinion was against them—too dashed unsportin'.'

'Did he always get his stag?' Leithen asked.

'In-var-i-ably, and got it off the ground and delivered it to the owner, for that was the rule of the game. Sometimes he had a precious near squeak, and Avington, who was going off his head at the time, tried to pot him—shot a gillie in the leg, too. But Jim always won out. I should think he was the best *shikari* God ever made.'

'Is that true, Archie?' Lamancha's voice had a magisterial tone.

'True—as—true. I know all about it, for Wattie Lithgow, who was Jim's man, is with me now. He and his wife keep house for me at Crask. Jim never took but the one man with him, and that was Wattie, and he made him just about as cunnin' an old dodger as himself.'

Leithen yawned. 'What sort of a place is Crask?' he inquired.

'Tiny little place. No fishin' except some hill lochs, and only rough shootin'. I take it for the birds. Most marvellous nestin' ground in Britain, barrin' some of the Outer Islands. I don't know why it should be, but it is. Something to do with the Gulf Stream, maybe. Anyhow, I've got the greenshank breedin' regularly, and the black-throated diver, and half-a-dozen rare duck. It's a marvellous stoppin'-place in spring, too, for birds goin' north.'

'Are you much there?'

'Generally in April, and always from the middle of August till the middle of October. You see, it's about the only place I know where you can do exactly as you like. The house is stuck away up on a long slope of moor, and you see the road for a mile from the windows, so you've plenty of time to take to the hills if anybody comes to worry you. I roost there with old Sime, my butler, and the two Lithgows, and put up a pal now and then who likes the life. It's the jolliest bit of the year for me.'

'Have you any neighbours?'

'Heaps; but they don't trouble me much.'

Crask's the earthenware pot among the brazen vessels—mighty hard to get to and nothing to see when you get there. So the brazen vessels keep to themselves.'

Lamancha went to a shelf of books above a writing-table and returned with an atlas. 'Who are your brazen vessels?' he asked.

'Well, my brassiest is old Claybody at Haripol—that's four miles off across the hill.'

'Bit of a swine, isn't he?' said Leithen.

'Oh no. He's rather a good old bird himself. Don't care so much for his family. Then there's Glenraden t'other side of the Larrig' (Archie indicated a point on the map which Lamancha was studying) 'with a real old Highland grandee livin' in it—Alastair Raden—commanded the Scots Guards, I believe, in the year One. Family as old as the Flood and very poor, but just manage to hang on. He's the last Raden that will live there, but that doesn't matter so much, as he has no son—only a brace of daughters. Then, of course, there's the show place. Strathlarrig—horrible great house as large as a factory, but wonderful fine salmon-fishin'. Some Americans have got it this year—Boston or Philadelphia, I don't remember which—very rich, and said to be rather high-brow. There's a son, I believe.'

Lamancha closed the atlas. 'Do you know any of these people, Archie?' he asked.

'Only the Claybodys—very slightly. I stayed with them in Suffolk for a cover shoot two years ago. The Radens have been to call on me, but I was out. The Bandicotts—that's the Americans—are new this year.'

'Is the sport good?

'The very best. Haripol is about the steepest and most sportin' forest in the Highlands, and Glenraden is nearly as good. There's no forest at Strathlarrig, but, as I've told you, amazin' good salmon fishin'. For a west coast river I should put the Larrig next to the Laxford.'

Lamancha consulted the atlas again and appeared to ponder. Then he lifted his head, and his long face, which had a certain heaviness and sullenness in repose, was now lit by a smile which made it handsomer and younger. 'Could you have me at Crask this autumn?' he asked. 'My wife has to go to Aix for a cure, and I have no plans after the House rises.'

'I should jolly well think so,' cried Archie. 'There's heaps of room in the house, and I promise you I'll make you comfortable. Look here, you fellows! Why shouldn't all three of you come? I can get in a couple of extra maids from Inverlarrig.'

'Excellent idea,' said Lamancha. 'But you mustn't bother about the maids. I'll bring my own man, and we'll have a male establishment except for Mrs Lithgow. . . . By the way, I suppose you can count on Mrs Lithgow?'

'How do you mean "count"?' asked Archie, rather puzzled. Then a difficulty struck him.

'But wouldn't you be bored? I can't show you much in the way of sport, and you're not naturalists like me. It's a quiet life, you know.'

'I shouldn't be bored,' said Lamancha. 'I should take steps to prevent it.'

Leithen and Palliser-Yeates seemed to divine his intention, for they simultaneously exclaimed. 'It isn't fair to excite Archie, Charles,' the latter said. 'You know that you'll never do it.'

'I intend to have a try. Hang it, John, it's the specific we were talking about—devilish difficult, devilish unpleasant, and calculated to make a man long for a dull life. Of course you two fellows will join me.'

'What on earth are you talkin' about?' said the mystified Archie. 'Join what?'

'We're proposing to quarter ourselves on you, my lad, and take a leaf out of Jim Tarras's book.'

Sir Archie first stared, then he laughed nervously, then he called upon his gods, then he laughed freely and long. 'Do you really mean it? What an almighty rag! . . . But hold on a moment. It will be rather awkward for me to take a hand. You see I've just been adopted as prospective candidate for that part of the county.'

'So much the better. If you're found out—which you won't be—you'll get the poaching vote solid, and a good deal more. Most men at heart are poachers.'

Archie shook a doubting head. 'I don't know about that. They're an awfully respectable lot up there, and all those dashed stalkers and keepers and gillies are a sort of trade union. The scallywags are a hopeless minority. If I get sent to quod—'

'You won't get sent to quod. At the worst it will be a fine, and you can pay that. What's the extreme penalty for this kind of offence, Ned?'

'I don't know,' Leithen answered. 'I'm not an authority on Scots law. But Archie's perfectly right. We can't go making a public exhibition of ourselves like this. We're too old to be listening to the chimes at midnight.'

'Now, look here.' Lamancha had shaken off his glumness, and was as tense and eager as a schoolboy. 'Didn't your doctor advise you to steal a horse? Well, this is a long sight easier than horse-stealing. It's admitted that we three want a tonic. On second thoughts Archie had better stand out—he hasn't our ailment, and a healthy man doesn't need medicine. But we three need it, and this idea is an inspiration. Of course we take risks, but they're sound sporting risks. After all, I've a reputation of a kind, and I put as much into the pool as any one.'

His hearers regarded him with stony faces, but this in no way checked his ardour.

'It's a perfectly first-class chance. A lonely house where you can see visitors a mile off, and

an unsociable dog like Archie for a host. We write the letters and receive the answers at a London address. We arrive at Crask by stealth, and stay there unbeknown to the countryside, for Archie can count on his people, and my man is a sepulchre. Also we've got Lithgow, who played the same game with Jim Tarras. We take on a job which will want every bit of our nerve and ingenuity, with a reasonable spice of danger—for, of course, if we fail, we should cut queer figures. The thing is simply ordained by Heaven for our benefit. Of course you'll come.'

'I'll do nothing of the kind,' said Leithen.

'No more will I,' said Palliser-Yeates.

'Then I'll go alone,' said Lamancha cheerfully. 'I'm out for a cure, if you're not. You've a month to make up your minds, and meanwhile a share in the syndicate remains open to you.'

Sir Archie looked as if he wished he had never mentioned the fatal name of Jim Tarras. 'I say, you know, Charles,' he began hesitatingly, but was cut short.

'Are you going back on your invitation?' asked Lamancha sternly. 'Very well, then, I've accepted it; and, what's more, I'm going to draft a specimen letter that will go to your Highland grandee, and Claybody, and the American.'

He rose with a bound and fetched a pencil and a sheet of note-paper from the nearest writing-table. 'Here goes—Sir, I have the honour to inform you that I propose to kill by legitimate means a stag—or a salmon as the case may be—on your land between midnight on — and midnight —. We can leave the dates open for the present. The animal, of course, remains your property and will be duly delivered to you. It is a condition that it must be removed wholly outside your bounds. In the event of the undersigned failing to achieve his purpose he will pay as forfeit one hundred pounds, and if successful, fifty pounds to any charity you may appoint. I have the honour to be, your obedient humble servant —'

'What do you say to that?' he asked. 'Formal, a little official, but perfectly civil, and the writer proposes to pay his way like a gentleman. Bound to make a good impression.'

'You've forgotten the signature,' Leithen observed dryly.

'It must be signed with a *nom de guerre*.' Lamancha thought for a moment. 'I've got it. At once business-like and mysterious.' At the bottom of the draft he scrawled the name 'John Macnab.'

(Continued on page 35.)

THE BREAKING OF THE BANKS ON REED'S ISLAND.

By ERNEST A. LITTEN, F.Z.S.

WIND and water, when properly harnessed, are of inestimable value to man; but either of these untamed, so to speak, is at times a terrible menace, and, when working in conjunction, they defy practically all efforts to restrain them.

'Reed's Island' or 'Read's Island' is an island in the river Humber some miles up the river. Within the memory of old men it was possible to walk out to it from the mainland at certain times. The swift seven-knot current of the river, however, did not take long to cut itself a passage, and, for a matter of an average lifetime, the island has been one at all stages of the tide. For a time the size of the island was under an acre, but the rich silt brought down by the river was deposited on and around it, until it grew to be some nine or ten acres in extent. The owners, realising its value as a summer pasture for cattle, built a bank of earth around it to keep out the water, and cut draining dykes across it. In summer the cattle grow fat on the rich grass, and the ground will carry a heavy stock, but as winter draws near they have to be shipped back to the mainland again, as the conditions change entirely.

One house is to be found, about the centre of the island, on its rising ground, but not very far from a creek where the cattle schooner is moored,

as well as a couple of row-boats. The family consists of husband and wife and three children, but when going to school the children have to lodge on the mainland, as fairly frequently weather conditions make it impossible for a boat to get across to the mainland. In winter the life is a lonely one, for only a few black-faced sheep, an odd cow or two, and a dog make up the stock, in addition to a small head of poultry. At present there is also a riding-horse, but no wheeled conveyance is kept.

Some years ago the government had a special use for the island, and a few officers and men were living there for a time. Finding the place ideal for coursing, they introduced hares, which did remarkably well, and multiplied exceedingly.

It does not take a great deal of imagination to picture the loneliness of the keepers of the island. Everything needed in the house had to be brought across by boat, from coal to needles. No kindly neighbours or friends handy in times of difficulty or trouble; practically no callers.

One evening they were sitting down quietly in their living-room, when the door was suddenly pushed open, such an unusual event as to make them almost scared! As a matter of fact it was only their own nine-year-old son, who was supposed to be safely in lodgings on the main-

land, where he was attending school. School had closed down owing to sickness, and the boy simply borrowed a boat, and, being used to the somewhat dangerous and difficult crossing, made no bones of attempting it in the dark, and just 'came along,' as he told them.

A few years ago the continuous heavy rainfall made many of our rivers overflow their banks, and thousands of acres of low-lying land were under water. The north-east of England was no exception in this respect, and the floods spread far and wide, the rivers being unable to carry off the water fast enough. The land got water-logged, and still the rain continued. And then happened that dangerous conjunction of wind and water that nearly resulted in the drowning of all living things on the island. The river in flood, high tides backed up by a mighty wind, and reaching its most dangerous state during the night hours! Fortunately the cattle had all been taken back to the mainland, so they were safe; but the pressure of the water on the banks and the overflowing of the dykes caused anxiety to the only man on the island, to say nothing of the young wife and mother.

The remaining few head of stock were safely housed and fed, and, hoping that things would improve ere morning, the family of four went to bed. The noise of the elements allowed the older ones to sleep only by fits and starts, and then suddenly all thought of sleep was banished. A number of screams and piercing cries rang out above the noise of the gale, which at first made them think that a vessel had been wrecked on the island, and that all hands were being drowned. Quickly they struggled into some clothes, and as the man went out to see what he could do, the mother waited on tenter-hooks in the house.

The screaming increased in violence, and seemed to come nearer and nearer to the house, until it was almost too much for the lonely waiting woman. At last, after half-an-hour or so—it seemed many hours—the husband returned and told the wife quickly to dress the children up warmly, ready to go at a minute's notice. In reply to her questions he said, 'The banks are broken and the island is flooded, but I have dragged the boat up to the garden fence, so that if the flood comes up here we must take to the boat and do the best we can.' But what

of the screaming, which was almost more nerve-racking than the danger itself? 'Tis the hares getting drowned; there are scores of them all trying to swim out of the flood, but the water is sure to get them, and they know it. It may get us too, so we cannot help them. They must just take their chance.'

Having done all that was possible to get ready for a quick departure if the worst came they got a hurried meal, but all the time these terrible screams, almost human, of the drowning hares were ringing out above the wind and rain. The time of high water passed, and then the water ceased to rise. After a bit it even receded a few inches, and they were able to pluck up courage once more, feeling that the immediate danger was over.

At long last daylight came, and what a desolate scene lay around them—water and mud, mud and water. The tops of the banks were still standing, but with ugly, dangerous gaps in places, through which the water was now running out into the already swollen river. As the higher ground cleared, the corpses of some hundreds of fine hares came to view, making the ground somewhat resemble a battlefield. Some were in heaps where they had reached a tiny island and sought safety, and others had died alone, having swum about until their strength gave out. 'Twas a ghastly sight, and the sound of their death-cries will never be forgotten by that little family gathering on the island.

As soon as it was safe to get to the mainland this was done, for great was the anxiety of friends as to the fate of the island family. Several hundred men have since been employed to try to renew the bank, but the wind and water together can always defeat their efforts.

Those of us who have visited this island in pursuit of ducks and geese during the winter months can, to some extent, visualise the night of the flood, and above the roaring north-easter can fancy we hear the screaming of the terrified hares. If the water had risen only a few feet higher, the house and outbuildings must have been washed away; and although the family would have been able to get into their boat, it is more than likely that they would never have been able to win to safety over the flooded river that was a raging torrent, sweeping all before it.

THE KING OF THE SNAKES.

By OLIVER ROLLAND.

IT is most astonishing how the belief in witchcraft, in some form or other, persists among the white people of South Africa. As I write, a case is before the Courts at Kimberley in which a white man and his wife have been deluded and defrauded by an Indian wizard.

The arrest of the witch-doctor by the police brought to light the fact that this particular gentleman had a clientèle amongst the whites in various parts of this vast country. Some wrote for love-potions; some for charms; one requested him to cause a certain young lady

to leave her home and join the writer in a distant part of the country. One old chap, evidently a sufferer from some kind of heart affection, wrote saying that he had done all the witch-doctor commanded, but still the pain remained, and so on.

Strangest of all, in my experience, after twenty years' residence, it is the white people of the towns who appear to be 'had' most by the black witch-doctors. I cannot account for it; I can only state the fact as proved by our Court records. I could understand, to some extent, the man or woman living for years in the wilds among natives becoming somewhat more infected with a belief in the supernatural than the average town-dweller. The vast solitude; the uncanny silence; the wonderful folklore of the natives; and the impressive belief in himself of the bedecked witch-doctor—all these eventually have some effect, in spite of one's better knowledge. Up to a certain age white children born among natives invariably believe in throwing the bones and 'smelling out'—what else could one expect? Nevertheless, it is the veldsman who treats the *m'tagart* more or less as a joke, while townsmen seem to fall an easy prey to those professing to possess supernatural powers.

As an example: Three years ago I was resident in Durban. In my garden I grew a magnificent, and prolific, vine. One season, as the fruit ripened to maturity, I noticed that continually an odd grape from the bunch was picked, as if by childish fingers. Always went the ripest grape. I questioned my own children, but each and all denied any knowledge of the occurrence. This went on until I set my Kaffir servant to watch. He discovered that a wild monkey came from Stella Bush in the early hours each night for the purpose of robbing my vine. I lay in wait for that monkey, and for two nights had the chagrin of hearing him cheek me from the top of a mango tree growing in my neighbour's garden. After the two nights, probably becoming scared, he came no more.

Some time later, my neighbour, a phlegmatic German by the way, dropped in for a chat. In the course of casual conversation I mentioned the incident of the monkey. He was greatly interested, and inquired if I had actually seen the animal. Of course I had not—whereupon he told me, very seriously, that he and his wife had heard the chattering and, feeling alarmed, had sent for a witch-doctor, who had informed them that the noise was the spirit of his father speaking to him. My friend, apparently objecting to his father's ghost disturbing his rest, had bought certain charms from the witch-doctor—at a stiff price, too—and, since then, he naively added, 'Father has come back never!'

To this day, that otherwise sane man firmly refuses to believe that what he and his wife

had heard was but the chattering of a monkey that nightly came to rob my vine.

Witch-doctors often obtain their reputations fortuitously. How I obtained the title of the 'King of Snakes' is worth relating. For some years my duties had kept me in the heart of the Mavenda country. One afternoon, according to custom, taking my siesta in the cool of my rondavel, I was suddenly aroused by my induna, who explained in Sesuto, 'Come quickly, baas—a big, big, snake!' Now, contrary to common belief, natives are very much afraid of snakes, and every colonial feels in duty bound to act the modern St Patrick on every possible occasion. Therefore I seized a heavy crop and ran after my induna, who went off at a great pace. At the back of the kraal I found a gathering of natives, standing in a wide circle, all teetering away like so many startled apes. 'Silence!' I commanded; 'where is the snake?' It was pointed out to me, and turned out to be a mamba not above average size.

'Give me your coat, Hobo,' I said to my induna, and, upon his compliance, I placed the garment lightly over the lethargic reptile, which had evidently dined recently. Hastening to the rondavel, I procured a four-gallon paraffin tin, in which I cut a hole large enough to allow of the entry of the snake. With this I hurried back to the scene of excitement.

Now a sleepy snake, having dined, will lie quiet for hours if covered; but disturbed, he will make for the nearest hole or, if one be not handy, will attack his disturbers. Knowing his ways very well, I placed the hole in the paraffin tin immediately opposite the place where I knew the snake's head to lie. To awe the now curious natives, I then chanted the first verse of the *Marseillaise* in French, and suddenly snatched off the coat and commanded in Sesuto: 'Enter the tin, O evil one. I, thy king, command thee!'

The effect, to the natives, was *m'tagart*. The disturbed reptile made for that paraffin tin, and the mamba being slightly on the fat side, it was amusing to watch its effort to get through the hole. All the time I encouraged it, until the last inch had disappeared, when I plugged it in. Later, in camp, a pot of boiling-water did the rest.

The effect upon the natives was wonderful. My fame spread throughout the country, and from that day I was hailed as the greatest witch-doctor of all, and my native name became the equivalent of 'The King of Snakes.'

Old M'Pefa, cunning old rascal, the real tribal witch-doctor, became a great friend of mine afterwards. Whenever one of his charms failed to work he would visit me, and the way he used to try to pump me regarding my 'big *muti*' was most amusing. Even now, I occasionally meet a boy in Johannesburg who remembers 'The King of the Snakes.'

ILLUSIONS.

By L. M. CORIN.

I.

IT was 5 o'clock, and the doors would not open until 7.45. An east wind was blowing, and in its train came penetrating gusts of snow at intervals. But the inclement weather acted as no deterrent to the enthusiastic theatre-goers who would sooner renounce a warm fireside than miss Frank Maine's *première*.

Martha Tintagel was at the pit-door before his first intrepid devotee made her appearance. She had lodged two stacks of folding-stools against the wall, and, despite the bitterness of the night, was optimistic that the whole of her stock would be requisitioned. When Frank Maine was starring she usually basked in a reflected prosperity.

Her hands were blue with the cold, her nose was very red, and her lips felt cracked and dry, though she was too wise to moisten them. Yet she was serene, even merry. She exchanged a cheery word with the newspaper-boys, the theatre-attendant, and a genial policeman, before custom demanded her attention.

She had very blue eyes, and her complexion, which had to withstand the rigours of an outdoor life, was remarkably clear and bright. Fashion at the time decreed that hats should be 'perched' upon wearers' heads. In that respect Martha was *à la mode*, though her head-gear boasted a gorgeous feather set at an angle that the *élite* of the day scarcely countenanced.

Martha's shawl was of a pronounced pattern. Beneath it a wide expanse of carefully laundered white apron showed in front, while a voluminous display of violet velvet was visible from the rear, and her shoes were substantial. Undoubtedly her chief attractions lay in her vivacity and youth.

Rapidly the leathern bag which hung from her waist filled with coins as her stock-in-trade was depleted; and when her entire store had been hired she watched, in common with her long queue of customers, the performance of the self-styled 'funny' man, who succeeded only in being pathetic.

Martha felt sorry for him. How could one be properly funny if one was hungry and cold? She suspected he was both, and could aver from experience that the sensations were not conducive to a sense of humour. He would have passed her with his furtive air and the shabby cap slightly withdrawn, but she was temporarily affluent by comparison, and sixpence from her bag found its way into his cap.

He gave her one swift, surprised look, and ambled on down the long line of people.

Her reward was as unexpected as it was

quick. The man with the chestnut grid who was coming round the corner knew Martha. He had reason to, as she had tended his wife in a recent illness. 'Catch, Martha!' he said.

Martha caught a shovelful of hot, aromatic chestnuts in the corner of her shawl, and laughed at her own adroitness as she thanked the donor. 'I'm in luck's way to-night,' she said.

II.

Five minutes before the doors opened Martha, in accordance with custom, collected her stools; then glanced expectantly across the road to the eel-pie shop. Some of the habitués of 'The Elysium' might deplore the fact that the pit and gallery entrances had such plebeian environment; but Martha, looking at the steamed window through which the, to her mind, delectable pies were hazily visible, was distinctly cheered by the prospect.

Jo Baxter worked in that shop; he admired her, and his love-offerings took the substantial and welcome form of eel-pies. She was quite as expectant as she had been the previous Saturday, but she was apprehensive as to the propriety of accepting further pies, for on the intervening Sunday she had promised Jack Webb, a local bootmaker, that she would be his wife.

However, Jo appeared with the pie, and Martha yielded to its temptation. She was quite convinced that Jack was the man for her, but she liked Jo immensely, though he puzzled her. He had been in turn a bricklayer, a painter, a driver of a C. P. van, and his latest venture had carried him into the shop of George Robotham.

Martha had remarked that she didn't think it 'much of a job,' and he had answered, 'What's the odds! I'm only gettin' my bearings. 'Tain't likely I mean to stop in that poky 'ole. Fact, Martha, I ain't no intention of stoppin' in this country at all. I mean to see the world, and don't intend stoppin' in the gutter neither.'

To Martha this talk seemed to border on the revolutionary, and she had reminded him of the adage about the rolling stone, aware as she was that on more than one occasion he had secured 'an Irishman's rise.'

But as she was graciously accepting the pie she was wondering how Jo would take the news. She sat down on one of her stools that she might eat this savoury supper ere its warmth departed on the biting breeze. 'It's mighty kind of you,' she said.

Jo grinned. 'I'm done for to-night, Martha, so I shall be able to see you 'ome. Reckon old

Robotham recalls the time when 'e 'ad a girl—what d' you say, Martha?'

Martha flushed and looked guilty, but her comment was non-committal. 'Don't know about that!'

But she was eyeing him askance between the bites. Would he be nasty about it? Would he say she had been leading him on? Had she? Martha was not quite sure.

III.

In a few minutes she was walking lightly along at his side, while he slung the strapped stools on his arm and laughed at Martha's trivialities. Before she had summoned courage to tell him she was engaged to another, she found herself listening to another proposal.

'I've saved a bit, Martha—told you once I meant to go to the States, didn't I? Well, I'm goin' soon, but I'd like your promise that you'll come out to me soon as I've settled down. You sha'n't regret it! Now, what do you say, kid?'

'Lor', now!' said Martha in consternation. 'If you'd only asked me Saturday night there ain't no tellin' wot mightn't 'a 'appened; but I bin and promised meself to Jack Webb, and I can't go back on my word.'

Jo screwed his lips up in a curious fashion, but his reply was philosophic. 'Oh well, my gal, I s'pose you know your own mind best.'

'Jack's a steady fellow, and 'e's asked me twice before,' she said, wondering whether she *had* known her own mind.

'And I'm not?' he asked whimsically. 'Don't you see, Martha, I've only been servin' a kind of prenticeship to an all-round knowledge o' things? Don't you see I mean to make somethin' of myself before I've done?'

Martha's vision was circumscribed. She did not see *that*; but she saw that he was rather handsome and very likeable. She was silent.

'Oh well,' he continued, 'if you 'urry up about it, I'll stand best man and wish the pair of you luck before I cross the briny.'

She looked gratefully at him, but inwardly she was rather piqued that he should take his dismissal so cheerily.

'That's uncommon kind of you, Jo,' she said. 'And Jack does say wiv 'is steady trade there ain't no need to wait.'

They drew up at the tenement house where Martha lodged with her widowed mother. Jo handed her the stools, bade her a brief good-night, and strode rapidly down the street.

He officiated as best man at the wedding, and Martha was once more a little piqued that he should bear up so very bravely in face of his frustrated hopes.

Jo went away without divulging the fact that his rival's steadiness was more apparent than real; neither did he mention that Jack, after purchasing what few items of furniture he deemed necessary, had not the wherewithal to

buy the 'real gold ring' upon which Martha insisted, and that in consequence he had 'obliged' the bridegroom with a couple of pounds.

Six weeks later Jo, with high hopes and an almost empty wallet, sailed for America.

IV.

Before Jo Baxter became president of the Ackroyd Textile and Woollen Trust he had sampled many callings. He had been in his time odd man on a sheep farm, navvy on a new rail-line, rancher in a small way, and rancher in a large way.

He had travelled to success, taking his learning, as the locomotives their water-supply—*en route*.

It was a fortunate day for him when he went into Arkansas City and encountered Molly Tiffarney behind the high counter of the new and dignified post-office. She had bright auburn hair and greeny-gray eyes, was self-reliant, counted out his change to him swiftly and unerringly, and didn't trouble to vouchsafe him a second glance.

It was this indifference that roused his interest. He pugnaciously resolved that she should notice him, and for that reason he saw to it that business took him frequently to the Arkansas post-office.

Presently Molly took due cognisance of him. Certainly, she admitted, he was a big, strong man, but he was uncouth. She granted, after a while, that he had a winning smile, and that he could conceal quite a few social defects. He was triumphant when she let him take her to a circus. He was enraptured when she permitted him to take her to the finest restaurant the city boasted. That outing was nearly his undoing.

Molly did not approve his table manners, and did not disguise the fact when he proposed another visit. Thereupon he set himself the task of improving them, and betook himself to the 'Alcazar' for the sole purpose of taking stock of his fellow-diners. He learned his lesson. Again, Molly had taken a course of elocution, and found her admirer sadly inexperienced with words. He took counsel with M'Kinnon, one-time dominie! Also he observed that her eyes were apt to be critical when they ran over the line of his clothes. He changed his tailor! Back in the valley he still wore check shirt, leather belt, knickers, and leather-thonged gaiters, but his sartorial outfit for high days and holidays was beyond reproach.

It was due to her influence that he made a belated acquaintance with the city library. Molly had said so frankly that she couldn't bear an ignorant man.

But it was not until after their marriage that Jo began to lift up his head in a social sense. Molly steadily fed the flame of ambition that had always burned within him. She urged to

fresh enterprise. So confident was she that her husband could do a wonderful overseas trade if he would but organise and handle the output of the scattered settlers, that he felt it incumbent upon him to prove that her belief in his omnipotence was not unfounded.

He launched out into this new activity, and concealed any doubts that assailed him. The venture was a complete success. He required no further urging; the spirit of adventure beckoned from that day.

He became an influential business man.

V.

Several more years passed before he was returned as 'Democrat' to the Senate. It was a great day both for him and for Molly—the crown of untiring efforts. Molly was a finished expositor (on paper), and Jo had a telling forensic style never hitherto suspected—a combination which resulted in some excellent extempore speeches.

Molly's ambition ran along social rather than political lines, but she knew quite well that success in the latter sphere would be a passport into the former.

As a senator her husband had a big pull. At the next election a Republican was returned in his stead, but by that time the Ackroyd Textile and Woollen Trust was of international importance.

The Baxters had two children, both a credit to their training. The boy graduated at Harvard, and the girl took 'honours' in art. The head of the family held forth with eloquence on the subject of the education of the child. Doubtless, memories of his own early years contributed to his earnestness.

It was during Alec Baxter's second year at Harvard that his father launched into literature with a brochure, 'Opportunity Crosses each Man's Path.' In this he dwelt, with a full share of Americanised *amour propre*, on his own invincibility in the face of obstacles and his successful climb to success. He omitted the 'Martha' incident.

He advocated the keeping of a journal and the recording of progress, affirming that since the first day he set foot in the States he had adhered to this practice. Molly acquired this information through reading her husband's book, which proved that his confidence had reservations. She was inclined to resent it, and passed one or two snappy comments; but Jo knew his American wife, and seized the occasion to announce that he'd been inquiring the price of Haliburton House—a palatial property that she had set her heart on.

She forgot the diary!

It was true that Jo Baxter kept a diary, and kept it under lock and key, too. It was well that Molly had not seen how coolly he had recounted the tale of his wooing.

'Decided after knowing Molly Tiffarney six months,' one entry ran, 'that she's the girl for me. Asked her to be my wife. Consented.'

Later he entered up, 'Married to-day,' and actually followed the statement with the query, 'Is marriage a lottery?'

Subsequently he recorded in a bold hand, 'Molly has not fallen short of expectations.'

And when he was returned for Askansas he wrote briefly, 'A great day!'

It would have interested not a few of his constituents to read another item which ran, 'Gratifying concession to the Ackroyd Textile and Woollen Trust.' But, as stated, the diary was safely under lock and key.

VI.

At forty-five Jo Baxter was to all intent—in outlook, appearance, and language—a typical American. It was no homesick feeling which lured him to England. He put the desire into plain words: 'I kind of want to see what lil ol' England looks like these days!'

Molly was an American born and bred, but she was just as curious to see what England looked like these days. Jo was for taking the children (now grown-up), but Molly didn't like her age being made apparent by Dorothy's proximity. As she said, it wasn't as if she *looked* forty-two. And then the children were assured a far easier time than their parents had known. On the whole she thought they two deserved a holiday.

So they booked a suite on the *Athenic*, and came over alone and in state.

Molly was discovering England while her husband set about its rediscovery. She toned down her Americanisms, but he didn't bother, being inordinately proud of the land of his adoption.

He went to have a look at the house where he was born, and found it a rather distressing link with the past. He returned to the Imperial, appreciative of its comforts, and inconsequently tipped the first waiter he met. The couple did the sights with habitual American precipitancy, and, anyway, Jo learnt more of England than he had as a native.

A chance picture from his car of a waiting queue watching the antics of a 'funny man' brought back thoughts of Martha. He had occasionally thought of her in the intervening years, and imagined her progressively comfortable and buxom. He suddenly decided that he and his wife would visit the Elysium. Directly he reached the hotel he 'phoned through and secured a box. It was not staging a good play, and it was deliberately-cultivated sentimentalism that led him back to the old spot. He did not expect to see Martha. But he did see her.

Their car, swinging past the pit and gallery entrance, was suddenly stayed by a policeman's arresting hand, when he caught sight of her. He was sure it was Martha, though in a shabby

black hat and a dilapidated shawl she did not look the blithe figure of former days.

'My dear,' he said to his wife, 'I see a friend of my youth.'

'Where?' she demanded.

'There,'—he indicated Martha.

The car began to move on.

'Shades of the Apostles!' ejaculated Molly. 'You're sure not renewing acquaintance these days.'

'Oh yes, I am.' He spoke with determination, but Molly could speak that way too. She was kind-hearted enough, but she saw nothing in Martha beyond a figure clad in a horrid shawl and an unforgivable hat—probably still in the gutter through drink, soliloquised Molly.

Jo Baxter followed his wife up the well-carpeted stairs, not braving her displeasure. He slipped into the box at her side. But his conscience was troubled. There was Martha—outside in the cold! Martha impoverished and prematurely aged! How many times on a public platform had he deprecated 'side.'

VII.

The next evening he excused himself glibly. He didn't believe in—if tact didn't decree—unnecessary candour with his wife on questions that vexed her. He was going in search of Martha.

He had looked out his plainest suit and most inconspicuous hat.

Martha knew him at once. 'Why, if it ain't Jo!' she exclaimed in reply to his quiet, 'Wa-al, and how's Martha? Hasn't the world been kind to you?'

'Oh, pretty middlin'.' She answered his query with attempted cheerfulness.

'And how's Jack?'

'Oh, in 'is grave this nine year,' she said; 'but the kiddies are off hand now. It was a hard job when they were young. Jack was ill off and on for years.'

Several passers-by looked curiously at the pair, and the American's eyes involuntarily followed their retreating figures, though he drew himself sharply to attention when he realised he was half-agreeing with their evident opinion of Martha.

Were coats dearer than shawls? He asked the question mentally and irrelevantly, then recalled his dictum of 'no side.' 'What do you say, Martha,' he suggested diffidently, 'to a little supper with me—just for old time's sake?'

Martha looked from her stock-in-trade to her shabby shoes. 'I'd like to, but——'

'Oh, bother buts,' he said. 'Get somebody to hike that bundle of sticks home for you.'

She called a boy, went deliberately to the modiste's that flanked the Elysium, and gazed at her reflection in the mirror there. She was ill-pleased. She came back to him apologetically. 'I ain't togged up for company!'

Mentally he agreed; his verbal comment was: 'You don't calculate that makes any odds to me!'

He found a *very* quiet restaurant. He did not enjoy the meal; Martha's lack of table manners was so disconcerting. He thought irritably and somewhat unreasonably, considering the different circle in which they had moved, that, as he had taught himself, she ought to have learned to comport herself more gracefully at table.

Suddenly Martha observed that he was regarding the antics of her knife and fork with great intentness; she got very hot and confused, and apologised for all sorts of things—her dress, her hair, her manner, her talk.

He reproached himself and became extremely cordial. 'I wasn't finding fault, Martha.'

'No, no,' she agreed hastily, 'it's only my nerves.'

VIII.

The meal over, he escorted her home, utterly ashamed because he could not be oblivious to the glances that were directed after their incongruous figures. Martha was in turn sentimentally reminiscent, weighed down with worries, and optimistic that a brighter day would dawn.

He felt for her one sincere emotion—and that was pity. Her lot had not been cast in Easy Street.

At parting he spoke very gently—merely as a penance for his mental attitude towards her. How could she guess that?

He begged her not to be offended; told her that he'd made a lot of money, and pressed a packet of notes into her hand.

Martha had seen, but never before had in her possession, bank-notes. She was tearfully grateful, and he squeezed her hand compassionately and asked her not to cry. She dried her tears and smiled at him, and for one brief instant her eyes magically regained their old intense blueness and beauty.

'Good-bye, Martha,' he said. 'Of course, I'm married—married an American girl years ago—we've got two children.'

Indoors, Martha sank limply into a chair. 'I oughter 'ave married *im*,' she soliloquised. 'E's got on an' no mistake. But 'e's just as tender-hearted. 'E must 'a still cared or 'e'd never 'ave looked at me the way 'e did. Nice eyes! 'Eallus 'ad nice eyes! But Lor', he's bin and married some purse-proud Yankee gal, an' me—wot a fool I was—my tale might 'a 'ad a 'appy ending.'

Martha crinkled the notes, spread them out on the table, spelled them out, and shed tears of mingled gratitude and regret.

The diary told a different tale.

'Gosh! What luck she'd accepted Jack Webb the Sunday before! My life-story might not have had such a happy ending had she said "Yes" to *me*,' Jo confided to its pages.

FOLKLORE FROM A FAROE PRÆSTEGAARD.

By ELIZABETH TAYLOR.

I.

THIS is a præstegaard¹ on the northern end of the most northern island of the Faroe group. If you climb a little way up a fjeld-slope north of the præstegaard, you can see the headlands of the six islands that form the parish of the pastor; Fuglø and Svinö on the east, this island, Viderö, and on the west Bordö, Kunö, and Kalsö. Their mighty promontories brave the northern seas that stretch, without a break, to the ice-floes of the Pole. Only young and strong men can serve in such a parish, in a storm-centre where Gulf Stream and Polar Current strive for the mastery.

The præstegaard is built of drift-wood that is well tarred every June, and roofed with birch-bark from Norway and grass-sods from the fields. The pastor and pastorinde are in far-away Denmark, but I have permission to stay here as a charge of the maids, Sigga and Drikke. I live in the seaward gable of the great attic, called the Maidens' Bower. A *nisse*—a kind of Danish brownie—lives next to the Maidens' Bower in a secluded north-west corner. As *nisses* are not indigenous to the Faroes, it is supposed that this one was a stowaway among the pastor's belongings when he came from Denmark six years ago.

The first year I made little progress in collecting bits of folklore. I knew no Old Norse (the language of the people) and not enough Danish to talk freely. The peasants have a great fear of ridicule, and if I had asked bluntly, 'Do you believe in *huldre-folk* [the underground folk]?' the answer would have been, 'The Lord preserve us—no! How could *froken* [miss] think I could be so foolish!' I found it best to adopt the methods of Robert Louis Stevenson when he trotted out his native brownies and kelpies in order to extract from some reluctant South Sea islander his own particular spooks.

The few accounts of the Faroes that have been published in English speak of *huldre-folk* as fairies, brownies, and the little people, but those who write about fairies in the islands are strangely unobservant. Where are the sylvan glades and bosky dells, the warmth and sunshine, the freely-growing green things beloved of fairies and butterflies? Not a tree, not a shrub grows wild in the Faroes. There are no butterflies, bees, or wasps. They would blow out to sea, or be drenched and battered by the cold storms that often last long even in the summer time. One fact I can affirm with con-

fidence. *Where there are no butterflies there are no fairies.*

II.

The nearest approach to fairies in size are the *voetrirr*—little creatures that live in cow-sheds or under houses, and, in good weather, often sit under the eaves, or after dark climb up and peer into the windows. They are associated with Christian service, while *huldre-folk* are of the Devil. They stay only where there are God-fearing, peace-loving people. Quarrelling and profanity drive them away. Even now I think that some of the old women, remembering the little *voetrirr*, pause in the doorway before they throw out hot water in the dark, and call out in warning, 'Take care, you who sit there-out!'

Some writers have also given the name *huldre-folk* to giants and giant trolls, but at the present time—and indeed as long ago as 1670, when Pastor Lucas Debes wrote about them in his book on the Faroes—*huldre-folk* are said to resemble human beings in size and appearance. They have homes underground in the wild outfields, in ravines and clefts up among the fjelds or near the sea. They have boats like those of the Faroe folk, and go to the fishery; they have cows, sheep that are always gray, dogs that are always black, and often have a light on the ends of their tails. Not always are the *huldre-folk* harmful. Many stories are told of kindly services rendered. Milk girls, lost in the fog, have been guided back to the village gate, and warning of approaching storms has been given to fishermen at sea. But if offended they take revenge, preferably on the anniversary of the day when the offence was given. Usually they are invisible, though at will they can reveal themselves. One who has second-sight can see them, and if you should go to the wild outfields with such a *fremsynt* (one who has second-sight) be careful not to tread in his footsteps, or touch his arm or his shoulder if you walk by his side. If you do, you will see what he sees.

Sometimes the *huldre-folk* put sweets or bright ribbons on a boulder or a grassy-slope near their own dwelling-places, and if a child eats the sweets or a young girl wears the ribbon, they will thenceforth see the *huldre-folk* and will be in their power. Sometimes a *fremsynt* sees a *huldre-maiden* dancing the bride's dance at a wedding-feast; or a *huldre-man* at such a feast will be hidden under a table, and when discovered will run out quickly in the darkness. *Huldre-children* have been seen playing with the children of this hamlet, though only once has a *huldre-child* been known to

¹ A manse.

enter a house. Then a little huldre-boy ventured inside, but soon a voice was heard calling, 'Reuben! Reuben!' The child burst into tears and ran out quickly. He was never seen again.

It would seem that (as with humans) there are good huldre-folk and bad ones. Why, if all serve the Powers of Evil, should many huldre-parents desire *souls* for their babies? A Faroe baby is in danger until it is christened. Huldre-folk will lie in wait to smuggle a huldre-baby into the cradle, hoping that the change will not be detected. If the huldre-baby is christened, it will possess a soul.

There are stories, too, of huldre-women in travail who could not be delivered unless aid was given by a *Christian* midwife. On New Year's Eve, a Faroe midwife stood by her fire stirring barley porridge. In came a black hound and pulled at her skirts, indicating by signs that she must come outside with him. She did so, and there stood a huldre-man waiting. He begged her to come and help his wife. Her eyes were bandaged, and she was led away up on the fjeld-side to the huldre-man's home. There she helped a young huldre-woman in dire need. Afterwards she was led back to her own home. Dawn had come before she reached her cottage, and all asked where she had been, but all she answered was, 'A large head has come into the world this day.' From that they knew she had been absent on a midwife errand, but more she never told. She received a handsome present also, but was bound to silence about it.

III.

Lately, storm-bound by really terrible gales, I have passed many hours in the great attic looking over old books and records of the olden times when the pastors spent a lifetime in the remoter parishes. One extract from the records determines the time when two men lived who were rivals in the mystic arts of sorcery.

'1706-66. Klement Jensen, Pastor in Vide-reide, Videro, during 60 years. This was "The Wise Priest," who, for the reason that he had gone in "The Black School," was equal in sorcery to Guttorm of Mula.'

Guttorm of Mula, and his wise old father, Rasmus of Haraldsund—how the personality of some men survives through many generations! So vivid are the stories told about Rasmus and Guttorm, so often are their sayings repeated, that at first I thought they had died but a short time ago.

Rasmus was a kind of chief in the six Northern Isles, and not always amenable to the tyranny and oppression of the trade monopoly and the Danish officials in Thorshavn. Both father and son were noted as powerful sorcerers—they had gone through the 'Black School'; but they used their wisdom only for the good of their fellow-men. Here is a little

tale about a fight the old man had with the Powers of Darkness made manifest in the huldre-folk who lived in the clefts and hollows of the island of Bordö.

Rasmus had five sons, clever lads, at sea. One morning, before the dawn, as they rowed seawards, they saw a boat in a rock-cleft on Bordö, where huldre-folk are said to dwell. The lads thought it was a boat from Strond, where the folk have big noses, and one of them called out mockingly, 'Always late for the fishing, Big Noses!' and other mocking words.

'*That shall be revenged!*' a voice answered from the shadows; but the lads only laughed and rowed on. They told their father about it when they returned.

'A troublesome nose that shall be to you,' mused Rasmus, and wrinkled up his own.

A year from that time, Rasmus, saying nothing to his sons, went down to the boat-house in the night, and hid himself in the boat, under the sail. He knew his sons would not permit him, old as he was, to go with them, and he feared that his power in sorcery would be needed that day. Towards morning the sons came, dragged out the boat, took their places at the oars, and rowed seawards. As they passed that unlucky cleft where they had seen the men the year before, out came a boat right towards them, so fast that the foam flew high from the prow. Straight towards them it came as though to cut them down. A huldre-boat it was, with huldre-men in it. Then the sail was thrown aside, and Rasmus sprang up. They had need of him! Against such foes only the power of sorcery could avail. Rasmus reached out, seized the prow, and with his strong arm wrenched it to one side, so that it struck only a slanting blow. A huldre-man in the prow seized one of the boys. Rasmus planted his foot on his son's sea-shirt, so that he could not be dragged away. 'Lord, save us!' cried Rasmus, and gripped the huldre-man, and they fought as the boats went on. The sons of Rasmus rowed with all their might. A dark cloud hid Rasmus and the huldre-man. Within its gloom the two were still struggling as the boats came north of Mula, and there came in sight the church of Videreide, with the cross on it, and beyond it the dawn breaking. At the same instant the huldre-man cried out, 'Knis-knas! The Red Cock in the East!'—that is to say, 'My strength is gone, for now rises the sun!' 'Ris-ras!' gasped Rasmus, and in a twinkling vanished the huldre-boat. When Rasmus and his sons came home, the old man told them that they must never again call out mocking words to a boat in the dusk.

IV.

From my window in the Maidens' Bower I can see across the water the tiny hamlet of Mula, under the grim heights of Bordö. There

lived Guttorm, son of Rasmus. It is said of him, 'a rare man, advanced in wisdom, trustworthy in every way.' He is connected with this old præstegaard by tales that show his power of sorcery—stories of Guttorm going out in a great gale to save life at sea, and calming the waves as the boat advanced; of Guttorm laying the troubled spirit of an unbaptised murdered child who had returned in the dreaded form of a 'niagrisur,' demanding the right to lie in sanctified earth. Of the many stories about Barbara of Sumbö (a village on the southernmost island), I like best the one of how she came north to see which was the stronger in sorcery, Guttorm of Mula or herself—Barbara the fair, who once had been tried for her life as a witch, and would have been burned had not the judge said *she was too beautiful to be tarred*. When she arrived Guttorm was with his sons at sea. She began to mix and to brew. She put limpet shells on the stream Matará, and said that the number that sank should be the number of the boats that were lost at sea. Such a storm Barbara raised by her spells that Guttorm and his sons barely escaped with their lives. As they rowed homewards the spindrift was like flying ashes, the waves blood-red to see.

'What is this?' cried one of his sons. 'The waves are on fire!'

'I know what it is,' Guttorm answered. 'Row thou, row! All is not well at home!'

As they came near the Mula landing-cliffs they saw Barbara sitting on the hillside by the stream, her long yellow hair flowing free about her. Then came the punishment of Barbara. Guttorm took his woollen mitten, put in it a stone weight from the fishing-nets, and struck her across the nose. He cut off those yellow locks, and with them much of her power vanished. He bound her to a seat close to the open hearth, and built thereon a great brewing-fire. He conjured her up on the house roof, and brought on a north-east storm with snow. Finally, at dawn, he let her go, more dead than alive. She had learned only too well—poor wicked Barbara—who in the Faroes was strongest in sorcery.

Nevertheless, Barbara had some power left. She vowed that no grass should ever grow on the place where Guttorm had conjured her, and to this day the sods on the Mula roof are bare where Barbara sat that night.

Guttorm's youngest son was called after his father. Guttorm told his wife that she must never let the little one go out in the *haugi* (the wild out-fields) fasting, or without his knife. At last, when he was almost grown up, he did go, fasting, and without his knife, and from that day he was lost. Many years later, a pastor of Videreide, who had second-sight, was going by sea around Mula with a crew of Videreide men. Looking landward, he saw young Guttorm crossing a grassy fjeld-slope.

'There goes a lost sheep of my flock,' said the pastor.

The men asked, 'Would it not be possible to get young Guttorm back?'

'No,' said the pastor with sorrow. 'He is a lost soul.'

v.

Rasmus and Guttorm live, not alone in musty records and old legends, but in the lives of those around me. In my wanderings about these six northern islands, if I meet some one, man or woman, who has a bright, full eye, a keen intelligence, who tells a story modestly and yet with a certain dramatic power, who is not ashamed to speak of the old customs and beliefs, then I query, 'You are, I believe, of the family of Guttorm of Mula?' and almost invariably the answer is, 'Yes, I am, but how did the Frøken know?'

One old woman I met in a distant hamlet, worn, bowed over with rheumatism, but I fancied I saw in her signs of the old race. So I did not ask her for stories, but, at a venture, I told her a little one about a descendant of Guttorm of Mula who had second-sight, and was thought to be almost equal in sorcery to Guttorm. It was his custom to remain in the church on New Year's Day after service, and, while sitting there quietly in the silent church, he would see the shapes of those who were to die in the coming year pass by him, go up the aisle, and stand before the altar. One New Year's Day he saw his old wife going up the aisle, and closely following her he saw himself. She died in the first week of the new year, and, seven days later, he died also.

As I ended my little tale I saw the face of the old woman light up with pride and pleasure. 'Frøken,' she cried, 'that old man was my grandfather!'

A woman who was also a descendant of Guttorm of Mula had second-sight from her eighth year. One summer morning she was playing outside her father's cottage, when she saw before her eyes, like a vision, bird-cliffs, sea-fowl, the sea below, and a man falling to his death. Frightened, she cried aloud, and ran to the cottage. Later in the day news came that on a distant island, at the same time, a man had been killed on the bird-cliffs. It was his custom to wear the old style Faroe dress that had long ago passed from use. The child had never before seen or heard of the man.

vi.

The gift of second-sight is not a happy one, and at the christening of a baby the godmother is careful to tilt the head backward, so that the water will not flow into the eyes and the child have second-sight. Jonas Lie calls second-sight a malady of the soul that no reflection, no reason, no remedy can cure. One is born with

a third window in the house of the soul in addition to one's two sound eyes—a window that opens out to a world of which others only dream. When the impulse comes one is forced to approach and gaze therefrom.

Many stories told me are of great age, but what shall one think of tales like the following one, that belong to the last generation?

It is the custom, during church services, for those who cannot attend to sit quietly at home, and not allow their children to play outside. One Sunday morning, a day of bright weather, a father and mother permitted their little three-year-old boy to play near the cottage door. Suddenly a black cloud came before the window, hiding all without; it vanished in a moment, and the parents ran out, but the child had gone. Search was made at once, the help of the pastor and district sheriff besought, and for three days parties of men looked far and wide for the child. The morning of the fourth day, a woman living ten miles away saw a child standing near her cottage. She asked him how he came there. He answered that 'the white man' had brought him. He was warm and clean, was not hungry or thirsty. Now, how could the child have traversed ten miles of rough country, bogs, fjeld-streams, and difficult rocky trails? His little sheepskin moccasins were quite clean.

The man who told this tale (it dates from his mother's time, and she dwelt near the place where the child lived) was a reliable man of much intelligence. He evidently believed this to be the work of huldre-folk. It was done to punish the parents for their neglect of Sunday customs, but the huldre-folk would not let the child suffer.

A pastorinde, when speaking of the huldre-folk, told me that in lonely parishes, where there is no companionship with men of education and varied interests, a stay of more than six years is unwise. Often, to men of imagination and sympathy, there comes a time when they query, 'Is it not possible that the Creator, in His inscrutable wisdom, permits these creatures to exist?' And then their wives decide that it is high time to take steps towards a flitting to prosaic work-a-day Denmark.

A pastor confessed to me that on one wild and lonely trail over fjeld and moor that he had to traverse alone he always felt a presence that accompanied him, heard a soft footfall just one step behind him and a little to one side, that again and again he has reasoned with himself, saying, 'It is only an echo—a nervous fancy; I will not turn and look!' Yet at last he has wheeled about suddenly, desperately, to find—nothing, and to go on unhappily, feeling again that invisible presence, hearing again that hushed footfall.

There is a Faroe saying, 'A knifeless man is a lifeless man,' or, in other words, 'A man with

no knife loses his life.' Steel protects against evil, both on land and at sea. Even now, a man will not go to the fishery or to the wild haugi without his knife, but if questioned about it he will make some jest about foolish old customs. In calm weather on a sunny day one can laugh at silly superstitions, but in darkness and storm, with danger on fjelds and sea, the old beliefs wake to life again.

VII.

Last Christmas Eve, in a terrible gale from the north-west, a young man tried to return to his home to 'hold Yule' with his family. The rocky trail passed around Mulen, where huldre-folk were said to dwell. On those rugged slopes young Guttorm had gone 'fasting and without his knife,' and never returned to the homes of men. All that night the gale raged. In the late dawn, the young man's body was found close to his father's door. His clothes were in tatters, his face, hands, feet, and knees cruelly lacerated. . . . A little group of men were talking together the next evening. One said gravely, '*All was not as it should be*' (an expression that signifies that supernatural powers had a part therein). 'That is true,' was the general assent. Then a man questioned. 'You heard? *He had no knife with him.*' 'Ay, we heard,' was the answer. That was all. Now these men knew well the mighty power of the dreaded 'cast-wind,' the *echo* wind, confined in great gales up in the hollows and clefts of the high fjelds in gathering force, until it bursts down with a report of a gun on the lands below. These men had seen the carcasses of sheep whirled up and cast down again and again on sharp ice and jagged rocks until they were a mass of broken bones and crushed flesh. Yet they gave no thought to the cast-wind as the cause of that tragic death. No, the lad, passing over those slopes where the huldre-folk dwelt, had no protecting steel with him; he had met the huldre-folk, had striven with them—and they had conquered.

A land of storms, yet there is a charm in high latitudes that the South cannot know; the mystery of starless summer nights, when the pale moon casts no shadows; the wonderful cloud and mist effects; the purity of colour in the dust-free air and deep sub-arctic sea. There are nights of coming storm when fishermen in home-hurrying boats see long lines of fjelds glowing as with inner fires, each blood-red peak flying a fiery banner like a volcano in eruption. Not seldom have the older men spoken to me of those calm and solemn hours at sea when the sunset and the sunrise colours together linger in the North. Their eyes 'behold the beauty of the Night,' and in the peace that broods over land and sea, they feel that the powers of darkness have no might.

Chambers's Journal

SEVENTH SERIES

FROM THE HIMALAYAS.

By Lieut.-Colonel P. T. ETHERTON.

'EAST is east, and west is west, and never the twain shall meet.' So said a famous writer who was well qualified to express an opinion on such a debatable question; one who spoke with conviction and a deep insight into men and things. The dictum reminds me of the adventures and experiences of a soldier of the Royal Garhwal Rifles, a crack regiment of the Indian army recruited from the Garhwalis, those hardy mountaineers of the Himalayas, whose valleys and rock-bound corries form so prominent a feature of the north-eastern frontier of India.

The rifleman in question accompanied me on a journey across Asia from India to Russia, Germany, and England, a trek of 3500 miles, passing through wild, inhospitable, and unknown regions of Central Asia, and finally, after innumerable adventures, emerging at Flushing, twelve months from the start. It is partly of his impressions of the West that I propose to deal in this article, as throwing additional light on the mentality of the Oriental as we see it in the masses.

The bare list of the names of places gone through in the long journey provokes curiosity and speculation, not only as to the physical geography of these *terrae incognitae*, but as to the inhabitants and the tide-waters of civilisation now breaking around the frontiers and shores of the haunts of Kirghiz, Kalmuks, and other nomads. The route led for many hundreds of miles by the sinuous Russian frontier in Central Asia, as well as through borderlands held by Chinese troops, or states but nominally owing dependence to the Flowery Kingdom. We passed through Yarkand, once the capital of ancient Tartary, where the Chinese governor gave an official dinner in honour of the expedition; thence onward by the Tarim basin and over the Thian Shan, or Heavenly Mountains, the home of the Asiatic Wapiti stag, ibex, roe-deer, wild sheep, and red and black bear. Then on to Sairum Nor and the Ebi Nor country, immense inland seas, on the shores of which we first saw wild horses. Although we had set out in March, the month of December had come as we pressed on into Mongolia, where the rivers were frozen, solid sheets of ice that would have borne a siege train. In such a land the shelter

of the felt huts or *yurts* of the nomad inhabitants, though by no means sanitary, was, nevertheless, most delectable. The thieving propensities of the natives had to be repressed at times with a firm hand, but the expedition pushed on in the teeth of a blizzard to the river Irtysh; the extremes of temperature were as nothing to guard against—the danger lay in the searching and wounding wind. From a small Russian military post on the Siberian frontier of Mongolia the journey was continued by sledge for 800 miles through Siberia to the Trans-Siberian Railway, and so onward through Russia and Germany to the shores of the North Sea.

We reached Flushing late at night by the express from Berlin, going at once on board the boat which was awaiting passengers for Sheerness. It was the first time the soldier from the Himalayas had set eyes upon the sea. He could not believe that it was genuine, and inquired earnestly if it were really all water. How the boat could get along without some one to push it, or some means by which it could be hauled, passed his comprehension, and lengthy explanations as to the capacity and power of engines, steam, and propellers appeared to leave him more mystified than ever.

On our arrival in London the underground railways were at once a source of lasting admiration. Before descending into the bowels of the earth it was explained that we were about to proceed to another part of London by means of a railway which, in this case, so far departed from the general rule as to find its way beneath the ground rather than above it. It was further pointed out that it resorted to this apparently extraordinary course owing to the extent and congested nature of the village above, which explanations seemed to be more or less satisfactory. On reaching the platform below he looked about for any signs of a train. He was then asked to listen carefully, and, applying himself eagerly to this exercise, remarked that he heard a sound in the distance as of some souls in torment, increasing to an extent that indicated a fight between a host of devils. The roar was intensified until a train burst from the tunnel, bells and gates clanged, passengers hurriedly alighted, and the monster sped on

again, disappearing, as our orderly expressed it, like a gigantic rat in a hole. On arrival of the next train he sprang aboard, alighting at our destination with an alacrity that would have done credit to the most accomplished strap-hanger, 'for,' said he, 'unless one got off in a hurry one might never get off at all, such was the speed and activity of this wonderful *gharri*' (carriage).

A visit to the Natural History Museum at South Kensington was productive of much quaint comment, and the writer had to demonstrate in terms of companies and double-companies just how much provender would be required to satisfy the appetite of a whale, a task calling for no slight display of imagination and mathematical skill.

The cruiser *Dreadnought* was then lying in Portsmouth Harbour, and the naval authorities accorded permission to look over it. The torpedoes, guns, and hydraulic loading were viewed with wonder not unmixed with awe, as well as the range and destructive powers of the projectiles. A year or so prior to the visit the *Dreadnought* had received attention from a party of 'Varsity wags who had impersonated an Abyssinian prince and his suite, an incident that excited much comment and amusement at the time. On approaching the gangway, armed with the requisite credentials, the writer was asked in an anxious undertone if all was in order, and not another case of the Abyssinian prince!

The horses, more particularly those of the brewer's dray type, received special praise for their size and strength, especially after the scraggy specimens one sees in India. The Oriental of the masses thinks largely in sheep and cattle, bread and water, and the immediate necessities of life. Beyond these and his wife and household, his views and outlook on life do not rise to any broader horizon. This is exemplified in an amusing incident that occurred during the visit of the Indian contingent to this country for the coronation of the present king. A party of them had been invited to inspect the house and park of a certain nobleman, where they were entertained to a feast prepared by Indian cooks. The spread followed a tour of the castle and grounds, and at its conclusion the host proposed the health of his guests in a short and happy speech. The senior Indian officer, a veteran of many frontier wars, who had crossed swords with wild Afridis from the Afghan border, and crafty warriors from the Abor jungles of north-eastern Burma, where the first indication of an enemy at hand is a flight of poisoned arrows, was deputed to reply on behalf of the assembled company. Such was his record that he could have told wondrous tales of life along the frontier, of battle, murder, and sudden death, and might well have held his audience spellbound. He rose to thank the host

for a sumptuous entertainment, and pausing, as if to give full weight to his words, added that he must congratulate the noble owner on the size and beauty of his cows, which were simply splendid! He then resumed his seat amidst the applause of his comrades.

One day we had occasion to visit the offices of a well-known daily in the Strand, and whilst I was engaged with a member of the staff the orderly was installed in a seat by the window commanding a view of the street, and the thoroughfare leading to Kingsway. About an hour later we returned to find him gazing intently into the roadway, seemingly fascinated by the stream of passers-by. Left thus alone, one might have thought he would have been bored with the long wait, but on the contrary, in answer to a question as to how he had found the time pass, he replied, 'I have been here but a few minutes, and since you left me many thousands of people, both men and women, have passed this window; yet, albeit I have looked well and closely, I have not seen the same person pass twice. It is indeed a wonderful country; how can you explain it all?'

It may be imagined that the letters he addressed to his relations in India came as a breath from the unknown, something quite beyond the ken and comprehension of those wild mountaineers of the Himalayas, who tend their flocks and herds unmindful of the world beyond, the rise and fall of nations, and the passing of empires.

One reminiscence awakens another, and, although it is a far cry from the snows of the Himalayas to the battlefields of France, it was there that our rifleman's regiment gained additional glory, proving their worth as much in the fighting line as in the less glorious field of trans-Asiatic exploration.

The letters from Indian soldiers at the front to their relatives and friends overseas were subject to the usual scrutiny by the censor, and many and strange were the compositions dealt with. They helped to lighten the censor's burden, and brought a touch of humour to a task that was otherwise dull and thankless.

To those who have travelled in Normandy, and the northern parts of France, the horse harnessed to a horizontal pole which he revolves by walking round a large trough, and so operating a mangle for washing clothes, must be a familiar sight, although of recent years it has fallen somewhat into disuse. Similarly the dog placed inside a large wheel which is revolved by the act of treading, although the animal does not actually move forward. The wheel being thus set in motion, and kept so by the dog pedalling, as it were, operates a churn for butter-making. This elicited the remarks in one of the letters in question that they were, indeed, in an extraordinary country, for here the horses washed the clothes, the dogs made the butter,

and the cats sat alongside the milk and never drank it!

Another penned a line to say that eleven kings were at war, but that the worst of these was the German king, who had blasted us all with his artillery, and, said this hero, 'as I write heads are lying around me like boulders.'

In describing his adventures under fire and elsewhere, an obviously athletic soldier of a Punjabi regiment related how he was lying wounded in a hospital when a German shell struck the roof and blew the entire place to atoms. 'I rose,' he said, 'from my bed, and ran for nine miles—until I got into another hospital.'

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER II.—DESPERATE CHARACTERS IN COUNCIL.

CRASK—which is properly Craoisg, and is so spelled by the Ordnance Survey—when the traveller approaches it from Larrig bridge, has the air of a West Highland terrier, *couchant* and *regardant*. You are to picture a long tilt of moorland running east and west, not a smooth lawn of heather, but seamed with gullies and patched with bogs and thickets, and crowned at the summit with a low line of rocks, above which may be seen peeping the spikes of the distant Haripol hills. About three quarters of the way up the slope stands the little house, white-washed, slated, gray stone framing the narrow windows, with that attractive jumble of masonry which belongs to an adapted farm. It is approached by a road which scorns detours and runs straight from the Glen highway, and it looks south over broken moorland to the shining links of the Larrig, and beyond them to the tributary glen of the Raden and the dark mountains of its source. Such is the view from the house itself, but from the garden behind there is an ampler vista, since to the left a glimpse may be had of the policies of Strathlarrig, and even of a corner of that monstrous mansion, and to the right, of the tidal waters of the river and the yellow sands on which in the stillest weather the Atlantic frets. Crask is at once a sanctuary and a watchtower; it commands a wide countryside, and yet preserves its secrecy, for, though officially approached by a road like a ruler, there are a dozen sheltered ways of reaching it by the dips and crannies of the hillside.

So thought a man who, about five o'clock on the afternoon of the 24th of August, was inconspicuously drawing towards it by way of a peat road which ran from the east through a wood of birches. Sir Edward Leithen's air was not more cheerful than when we met him a month ago, except that there was now a certain vigour in it which came from ill-temper. He had been for a long walk in the rain, and the scent of wet bracken and birches and bog myrtle, the peaty fragrance of the hills salted with the tang of the sea, had failed to comfort, though not so long ago these things had had the power to intoxicate. Scrambling in the dell of a burn, he had observed both varieties of the filmy fern

and what he knew to be a very rare cerastium, and, though a lover of plants, he had observed them unmoved. Soon the rain had passed, the west wind blew aside the cloud-wrack, and the Haripol tops had come out black against a turquoise sky, with Sgurr Dearg, awful and remote, towering above all. Though a keen mountaineer, the spectacle had neither exhilarated nor tantalised him. He was in a bad temper, and he knew that at Crask he would find three other men in the same case, for even the debonair Sir Archie was in the dumps with toothache.

He told himself that he had come on a fool's errand, and the extra absurdity was that he could not quite see how he had been induced to come. He had consistently refused; so had Palliser-Yeates; Archie as a prospective host had been halting and nervous; there was even a time when Lamancha, the source of all the mischief, had seemed to waver. Nevertheless some occult force—false shame, probably—had shepherded them all here, unwilling, unconvinced, cold-footed, destined to a preposterous adventure for which not one of them had the slightest zest. Yet they had taken immense pains to arrange the thing, just as if they were all exulting in the prospect. His own clerk was to attend to the forwarding of their letters, including any which might be addressed to 'John Macnab.' The newspapers had contained paragraphs announcing that Lady Lamancha had gone to Aix for a month, where she would presently be joined by her husband, who intended to spend a week drinking the waters before proceeding to his grouse-moor of Leriote in the Borders. The *Times* three days ago had recorded Sir Edward Leithen and Mr John Palliser-Yeates as among those who had left Euston for Edinburgh, and more than one social paragraph had mentioned that the ex-Attorney General would be spending his holiday fishing on the Tay, while the eminent banker was to be the guest of the Chancellor of the Exchequer at an informal vacation conference on the nation's precarious finances. Lamancha had been fetched under cover of night by Archie from a station so remote that no one but a lunatic would think of using it. Palliser-Yeates

had tramped for two days across the hills from the south, and Leithen himself, having been instructed to bring a Ford car, had had a miserable drive of a hundred and fifty miles in the rain, during which he had repeatedly lost his way. He had carried out his injunctions as to secrecy by arriving at two in the morning by means of this very peat road. The troops had achieved their silent concentration, and the silly business must now begin.

Leithen groaned, and anathematised the memory of Jim Tarras. As he approached the house he saw to his amazement a large closed car making its way down the steep moor. Putting his glass on it, he watched it reach the glen road and then turn east, passing the gates of Strathlarrig, till he lost it behind a shoulder of hill. Hurrying across the stableyard, he entered the house by the back door, disturbing Lithgow the keeper in the midst of a whispered confabulation with Lamancha's man, whose name was Shapp. Passing through the gun-room, he found in the big smoking-room, which looked over the valley, Lamancha and Palliser-Yeates, with the crouch of conspirators, flattening their noses against the window-panes.

The sight of him diverted the attention of the two from the landscape.

'This is an infernal plant,' Palliser-Yeates exclaimed. 'Archie swore to us that no one ever came here, and the second day a confounded great car arrives. Charles and I had just time to nip in here and lock the door, while Archie parleyed with them. He's been uncommon quick about it. The brutes didn't stay for more than five minutes.'

'Who were they?' Leithen asked.

'Only got a side glance at them. They seemed to be a fat woman and a girl—oh, and a yelping little dog. I suppose Archie kicked him, for he was giving tongue from the drawing-room.'

The door opened to admit their host, who bore in one hand a large whisky-and-soda. He dropped wearily into a chair, where he sipped the beverage. An observer might have noted that what could be seen of his wholesome face was much inflamed, and that a bandage round chin and cheeks which ended in a top knot above his scalp gave him the appearance of Ricquet with the Tuft in the fairy tale.

'That's all right,' he said in the tone of a man who has done a good piece of work. 'I've choked off visitors at Crask for a bit, for the old lady will put it all round the countryside.'

'Put what?' said Leithen; and 'Who is the old lady?' asked Lamancha; and 'Did you kick the dog?' demanded Palliser-Yeates.

Archie looked drearily at his friends. 'It was Lady Claybody and a daughter—I think the second one—and their horrid little dog. They won't come back in a hurry—nobody will come

back—I'm marked down as a pariah. Hang it, I may as well chuck my candidature. I've scuppered my prospects for the sake of you three asses.'

'What has the blessed martyr been and done?' asked Palliser-Yeates.

'I've put a barrage round this place, that's all. I was very civil to the Claybodys, though I felt a pretty fair guy with my head in a sling. I bustled about, talkin' nonsense and offerin' tea, and then, as luck would have it, I trod on the hound. That's the worst of my game leg. The brute nearly had me over, and it started howlin'—you must have heard it. That dog's a bit weak in the head, for it can't help barkin' just out of pure cussedness—Lady Claybody says it's high-strung because of its fine breedin'. It got something to bark for this time, and the old woman had it up in her arms fondlin' it and lookin' very old-fashioned at me. It seems the beast's name is Roguie, and she called it her darlin' wee Roguie, for she's pickin' up a bit of Scots since she came to live in these parts. . . . Lucky Mackenzie wasn't at home. He'd have eaten it. . . . Well, after that things settled down, and I was just goin' to order tea, when it occurred to the daughter to ask what was wrong with my face. Then I had an inspiration.'

Archie paused and smiled sourly. 'I said I didn't know, but I feared I might be sickenin' for small-pox. I hinted that my face was a horrid sight under the bandage.'

'Good for you, Archie,' said Lamancha. 'What happened then?'

'They bolted, fairly ran for it. They did record time into their car—scarcely stopped to say good-bye. I suppose you realise what I've done, you fellows. The natives here are scared to death of infectious diseases, and if we hadn't our own people we shouldn't have a servant left in the house. The story will be all over the countryside in two days, and my only fear is that it may bring some medical officer of health nosin' round. . . . Anyhow, it will choke off visitors.'

'Archie, you're a brick,' was Lamancha's tribute.

'I'm very much afraid I'm a fool, but thank Heaven I'm not the only one. Sime,' he shouted in a voice of thunder, 'what's happened to tea?'

The shout brought the one-armed butler and Shapp with the apparatus of the meal and an immense heap of letters, all addressed to Sir Archibald Roylance.

'Hullo! the mail has arrived,' cried the master of the house. 'Now let's see what's the news of John Macnab?'

He hunted furiously among the correspondence, tearing open envelopes and distributing letters to the others with the rapidity of a conjuror. One little sealed packet he reserved to

the last, and drew from it three missives bearing the same superscription. These he opened, glanced at, and handed to Lamancha. 'Read 'em out, Charles,' he said. 'It's the answers at last.'

Lamancha read slowly the first document, of which this is the text:

GLENRADEN CASTLE,
STRATHLARRIG.
Aug. —, 19—.

SIR,—I have received your insolent letter. I do not know who you may be, except that you have the morals of a bandit and the assurance of a halfpenny journalist. But since you seem in your perverted way to be a sportsman, I am not the man to refuse your challenge. My reply is, sir, damn your eyes and have a try. I defy you to kill a stag in my forest between midnight on the 28th of August and midnight of the 30th. I will give instructions to my men to guard my marches, and if you should be roughly handled by them you have only to blame yourself.—Yours faithfully, ALASTAIR RADEN.

JOHN MACNAB, Esq.

'That's a good fellow,' said Archie with conviction. 'Just the sort of letter I'd write myself. He takes things in the proper spirit. But it's a blue look-out for your chances, my lads. What old Raden don't know about deer isn't knowledge.'

Lamancha read the second reply.

STRATHLARRIG HOUSE,
STRATHLARRIG.
Aug. —, 19—.

MY DEAR SIR,—Your letter was somewhat of a surprise, but as I am not yet familiar with the customs of this country, I forbear to enlarge on this point, and since you have marked it 'confidential' I am unable to take advice. You state that you intend to kill a salmon in the Strathlarrig water between midnight on September 1 and midnight on September 3, this salmon, if killed, to remain my property. I have consulted such books as might give me guidance, and I am bound to observe that in my view the laws of Scotland are hostile to your suggested enterprise. Nevertheless, I do not take my stand on the law, for I presume that your proposition is conceived in a sporting spirit, and that you dare me to stop you. Well, sir, I will see you on that hand. The fishing is not that good at present that I am inclined to quarrel about one salmon. I give you leave to use every method that may occur to you to capture that fish, and I promise to use every method that may occur to me to prevent you. In your letter you undertake to use only 'legitimate means.' I would have pleasure in meeting you in the same spirit, but I reckon that all means are counted legitimate in the capture of poachers.—Cordially, JUNIUS THEODORE BANDICOTT.

Mr J. MACNAB.

'That's the young 'un,' Archie observed. 'The old man was christened "Acheson" and don't take any interest in fishin'. He spends his time lookin' for Norse remains.'

'He seems a decent sort of fellow,' said Palliser-Yeates, 'but I don't quite like the last sentence. He'll probably try shooting, same as the fellow did on the Beaulieu. Whoever gets this job will have some excitement for his money.'

Lamancha read out the last letter.

227 NORTH MELVILLE STREET,
EDINBURGH.
Aug. —, 19—.

re Haripol Forest.

SIR,—Our client, the Right Honourable Lord Claybody, has read to us on the telephone your letter of August —, and has desired us to reply to it. We are instructed to say that our client is at a loss to understand how to take your communication, whether as a piece of impertinence or as a serious threat. If it is the latter and you persist in your intention, we are instructed to apply to the Court for a summary interdict to prevent your entering upon his lands. We would also point out that under the Criminal Law of Scotland any person whatsoever who commits a trespass in the daytime by entering upon any land without leave of the proprietor in pursuit of, *inter alia*, deer, is liable to a fine of £2, while if such person have his face blackened, or if five or more persons acting in concert commit the trespass, the penalty is £5 (2 & 3 William IV. c. 68).—We are, Sir, Your obedient servants,

PROSSER, M'KELPIE & MACLYMONT.

JOHN MACNAB, Esq.

Lamancha laughed. 'Is that good law, Ned?'

Leithen read the letter again. 'I suppose so. Deer being *feræ naturæ*, there is no private property in them or common law crime in killing them, and the only remedy is to prevent trespass in pursuit of them or to punish the trespasser.'

'It seems to me that you get off pretty lightly,' said Archie. 'Two quid is not much in the way of a fine, for I don't suppose you want to black your faces or march five deep into Haripol. . . . But what a rotten sportsman old Claybody is.'

Palliser-Yeates heaved a sigh of relief. 'I am bound to say the replies are better than I expected. It will be a devil of a business, though, to circumvent that old Highland chief, and the young American sounds formidable. Only, if we're caught out there, we're dealing with sportsmen, and can appeal to their higher nature, you know. Claybody is probably the easiest proposition so far as getting a stag is concerned, but if we're nobbled by him we needn't look for mercy. Still, it's only a couple of pounds.'

'You're an ass, John,' said Leithen. 'It's only a couple of pounds for John Macnab. But if these infernal Edinburgh lawyers get on to the job, it will be a case of producing the person of John Macnab, and then we're all in the cart. Don't you realise that in this fool's game we simply cannot afford to lose—none of us.'

'That,' said Lamancha, 'is beyond doubt the truth, and it's just there that the fun comes in.'

The reception of the three letters had undoubtedly brightened the atmosphere. Each man had now something to think about, and till it was time to dress for dinner, each was busy with sheets of the Ordnance maps. The rain had begun again, the curtains were drawn,

and round a good fire of peats they read and smoked and dozed. Then they had hot baths, and it was a comparatively cheerful and very hungry party that assembled in the dining-room. Archie proposed champagne, but the offer was unanimously declined. 'We ought to be in training,' Lamancha warned him. 'Keep the "Widow" for the occasions when we need comforting. They'll come all right.'

Palliser-Yeates was enthusiastic about the food. 'I must say, you do us very well,' he told his host. 'These haddocks are the best things I've ever eaten. How do you manage to get fresh sea fish here?'

Archie appealed to Sime. 'They come from Inverlarrig, Sir Erchibald,' said the butler. 'There's a wee laddie comes up here sellin' haddies verra near every day.'

'Bless my soul, Sime. I thought no one came up here. You know my orders.'

'This is just a tinkler laddie, Sir Erchibald. He sleeps in a cairt down about Larrigmore. He just comes up with his powny and awa back, and doesna bide twae minutes. Mistress Lithgow was anxious for haddies, for she said gentlemen got awfu' tired of saumon and trout.'

'All right, Sime. I'll speak to Mrs Lithgow. She'd better tell him we don't want any more. By the way, we ought to see Lithgow after dinner. Tell him to come to the smoking-room.'

When Sime had put the port on the table and withdrawn, Leithen lifted up his voice. 'Look here, before we get too deep into this thing, let's make sure that we know where we are. We've all three turned up here—why, I don't know. But there's still time to go back. We realise now what we're in for. Are you clear in your minds that you want to go on?'

'I am,' said Lamancha doggedly. 'I'm out for a cure. Hang it, I feel a better man already.'

'I suppose your profession makes you take risks,' said Leithen, dryly. 'Mine doesn't. What about you, John?'

Palliser-Yeates shifted uneasily in his chair. 'I don't want to go on. I feel no kind of keenness, and my feet are rather cold. And yet, you know, I should feel rather ashamed to turn back.'

Archie uplifted his turbaned head. 'That's how I feel, though I'm not on myself in this piece. We've given hostages, and the credit of John Macnab is at stake. We've dared old Raden and young Bandicott, and we can't decently cry off. Besides, I'm advertised as a smallpox patient, and it would be a pity to make a goat of myself for nothing. Mind you, I stand to lose as much as anybody, if we bungle things.'

Leithen had the air of bowing to the inevitable. 'Very well, that's settled. But I wish to

Heaven I saw myself safely out of it. My only inducement to go on is to score off that boulder Claybody. He and his attorney's letter put my hackles up.'

In the smoking-room Lamancha busied himself with preparing three slips of paper and writing on them three names. 'We must hold a council of war,' he said. 'First of all, we have taken measures to keep our presence here secret. My man Shapp is all right. What about your people, Archie?'

'Sime and Carfrae have been warned, and you may count on them. They're the kind that ask no questions. So are the Lithgows. We've no neighbours, and anyway, they're not the gossipin' sort, and I've put them on their Bible oath. I fancy they think the reason is politics. They're a trifle scared of you, Charles, and your reputation, for they're not accustomed to hidin' Cabinet Ministers in the scullery. Lithgow's a fine crusted old Tory.'

'Good. Well, we'd better draw for beats, and get Lithgow in.'

(Continued on page 53.)

RHEIMS CATHEDRAL.

Before.

A SOARING dream flung lightly on the sky—
Or so it seems—the giant structure raises
High-pointed arch and sculptured tower in praises
Which thrill and melt into God's blue on high.
Deep history of Man! Aspiring stone!
From down the soil each rumbling buttress
towers
In scrolls and columns, to what blinding powers
Of a divinest logic, carved and grown.
Not this alone—the silence of pale saint,
And high-crowned king, and antique prophet
hoary—
From each twined porch and smallest door, a
glory
Of human music streaming! High, now faint
Man's passionate worship on Man's human wings
Throbs here in grand completion of God's things.

After.

ALL this lies dead and silent with the stones
For all the world to sigh at with the winds. . . .
Its own lashed sacred dust whorls up and blinds
Not e'en a crippled beggar in his bones!
Transparent as an eggshell on that sky—
Unchanging sky!—blurred filagree of lace
Still tries to cling in shrouds o'er its wan face,
The antique dulled suggestion scattered by.
Choked in its own dim powder, one long pain;
Proud saint and prophet, Virgin diademed—
Man's thrice-fired soul by Man's own hand con-
demned—
'Tis still divinest logic! What huge chain
Far-flung from human eye, if so it be!
And generations later—shall *they* see?

HELENA DE VEER.

HOW THE YANKEES TWICE 'FORCED' THE DARDANELLES.

By Commander LORD TEIGNMOUTH, R.N.

FEW readers of this magazine, probably, are sufficiently versed in the naval history of the United States to be aware that, notwithstanding the aloofness from the affairs of the Old World which has been the key-note of its foreign policy since the 'Declaration of Independence,' the nation, during the first thirty years of its existence, was engaged in almost continuous hostilities with the Old World Powers.

Trouble first arose with the Dey of Algiers, whose piratical attacks on Mediterranean commerce had been tolerated for years past in a manner discreditable to the Christian states of Europe. This Algerian piracy had to be endured by a new country like the United States, simply for lack of means of self-defence. From the persistent way in which American commerce now appeared to be singled out for capture or destruction, it was evident that the dey was intent on forcing the nation to submit to the same humiliating system by which other states purchased immunity for their shipping—namely, by payment of blackmail, or 'tribute,' as the dey preferred to call it. And this savage ruler, not content with raiding American commerce, further threatened personal violence to any agent of the Republic who dared to set foot in his dominions. This, however, was more than the most peace-loving of peoples could stomach; and a naval force of six frigates was ordered to be prepared, with a view to enforcing respect for the American flag.

In the sequel, hostilities were avoided, and a year later (1795) a treaty was concluded with the dey. Commenting on this episode, Fenimore Cooper, the United States naval historian, states that the peace thus procured cost the United States a sum 'quite sufficient to have kept the barbarian's ports hermetically sealed until he should have humbly sued for permission to send a craft to sea.'

Two years later, we read of the *Crescent* frigate being sent by the President of the United States to the Dey of Algiers 'as compensation for delay in fulfilling Treaty stipulations.' As the vessel also took twenty-six barrels of dollars 'and many valuable presents,' the story is suspiciously suggestive of 'blackmail.' She further conveyed a gentleman, as the future United States Consul-general, who had already spent ten years in Algiers as a prisoner. The captain and the chief officer and several of the crew had also, it seems, experienced a similar unpleasant detention.

The manner in which the dey requited this uncalled-for generosity was characteristic, and supplies a melancholy commentary on the folly

of condoning acts of black piracy—instead of hanging the pirates, when caught, and destroying their nests.

From what follows, there is every reason to believe that, ever since the patched-up peace of 1795, to say nothing of the present of a frigate by way of 'compensation,' along with its cargo of dollars and 'valuable presents,' the barbarian ruler of Algiers had been consistently levying blackmail, under the name of 'tribute,' from the 'free and independent' citizens of the United States who, it is only right to remind the reader, had recently shaken off the galling yoke of a British king.

The historian of the United States navy states that in May 1800 a frigate, bearing the honoured name of their first President, *George Washington*, commanded by Captain Bainbridge, sailed under orders to convey 'tribute' to Algiers—in other words to carry blackmail to the dey. Were not the subsequent happenings recorded by so reliable a historian as Fenimore Cooper, one would be justified in treating the above statement, as well as the entire story, as a joke. History, however, is full of these surprises. And the sequel only proved the folly of pandering to the greed of a savage.

No sooner had the *George Washington* reached her destination, and delivered the 'tribute,' than the dey coolly demanded that the vessel should be placed at his disposal. For what purpose? For the conveyance of what he called a 'Mission' to Constantinople; in reality, to carry blackmail to his over-lord, the sultan, who had taken offence at some act of the dey's. And to Captain Bainbridge, of the *George Washington*, was to be deputed the doubtful honour of conveying the *douceur*. Yes, and convey it he did—though not without remonstrance! Thus did one false step lead to another.

Captain Bainbridge could not, of course, refuse to carry 'tribute' from the United States to Algiers, no matter what his own views on the subject might be; but when it came to being ordered by a barbarian to convey blackmail to the sultan, his conscience revolted at the very suggestion. And so, on hearing of the dey's intention, he sought an interview with the tyrant, to whom he politely intimated his regret that the orders he had received from his own government would not admit of compliance with His Highness's wishes. Thereupon the latter, discarding the mask of politeness, gave his visitor to understand—somewhat bluntly, one opines—that both he and the *George Washington* were in his power, and that a request from the Dey of Algiers was equivalent to a com-

mand. 'A lively altercation ensued,' writes the historian. In the end, however, the dey, as was to be expected, had his way. The indignant captain, 'acting on the advice of his consul,' who, poor man, unwilling to risk decapitation, urged compliance, consented to convey the 'presents,' as they were called, to Constantinople.

Before sailing, further trouble arose over the colours that were to be flown during the trip, the dey insisting on his own flag occupying the place of honour. Captain Bainbridge, we are told, 'while yielding in appearance,' hoisted the Stars and Stripes directly the vessel was out of range of the batteries, and kept them flying until his return.

On arrival off the historic 'Castles' guarding the entrance to the Dardanelles, Captain Bainbridge, being under the American flag, and having no firman (permission to enter), 'felt some embarrassment,' we learn; for his country, having but recently come into existence, would be unknown at the Ottoman Porte, and the ship might be delayed many weeks while negotiations were being conducted. From this dilemma the captain relieved himself by the prompt expedient of a seaman.

The armament of the Turkish batteries, it must be explained, though numerous and formidable, throwing stone shot of 700 to 800 lb., was mounted on fixed carriages, and, therefore, only effective as long as the target remained within a very contracted field of fire. Captain Bainbridge, being aware of this, had recourse to a *ruse de guerre*, which did credit to his 'cuteness.' On approaching the batteries, he shortened sail, as if about to anchor; and when abreast of the most formidable work, saluted the Turkish flag. The salute was promptly returned. While the ship was enveloped in smoke, sail was quickly reset; and ere the Turks realised the trick that was being played—so unprepared were they for such a breach of good manners—the *George Washington* was speeding away towards the capital, and out of reach of their guns. Talk of Yankee cheek!

Telegraphs and wireless being then nonexistent, the vessel reached Constantinople long ere news of the escapade filtered through to headquarters. There the ship was boarded in the usual manner, and inquiries as to the flag she was flying were answered to the apparent satisfaction of the boarding-officer. Later, however, the official returned to say that his government had never heard of such a country as the United States of America, and requested a more explicit statement. The only explanation vouchsafed was to the effect that the vessel came from the 'New World,' with which the government had to be content.

Here the *George Washington* remained for eight weeks; and as the visitors, according to our authority, were treated with 'much of that

polished hospitality for which the Turkish government is justly esteemed,' we may take it that, in spite of their somewhat brusque introduction, Captain Bainbridge and his officers enjoyed a 'real good time.' That the Turks bore them no ill-will for 'forcing' the Dardanelles may be inferred from the fact that, on leaving, the ship was provided with a 'firman of protection from the Capitan Pasha.'

Amongst the state secrets pertaining to this first official visit of a warship from the 'New World' to the capital of the Turkish Empire—glossed over by the historian—is the explanation, given by the captain of the *George Washington*, of the circumstances under which the vessel made her debut at Constantinople—namely, as a bearer of tribute from a vassal state to the sultan. Such a 'Mission' was little calculated to impress the Turks with the importance, or even the 'independence,' of the 'New World' Power.

Captain Bainbridge's exploit at the Dardanelles would, naturally, cause a sensation when it got bruited about in his own country, for it implied ingenuity as well as courage. Moreover, in so young and small a navy as that of the United States, there would be many a lad eager to 'win his spurs' by following in Captain Bainbridge's footsteps. Much water, however, was destined to flow through the Bosphorus before the exploit was repeated.

Ten years later the lion was again 'bearded in his den,' this time, strange to relate, by a ship of the mercantile marine. Alas that no statement on the subject—nor even the name of the daring skipper who followed the precedent established by Captain Bainbridge—is forthcoming from the historian of the United States navy! Indeed, but for the chance discovery of a letter from the British representative at Constantinople reporting the occurrence, the incident would probably never have been rescued from the oblivion which had overtaken it.

In a despatch to the Prime-minister (Feb. 10, 1810), Sir R. Adair wrote: 'A large American trader, painted exactly like a frigate of twenty guns, passed through the Dardanelles under its own colours, and came right up to Constantinople. I cannot describe the degree of offence this proceeding has given to the Turkish Government.' And the writer went on to explain that America, having no treaty with the Porte, had no right even to frequent the ports of the Levant; 'but to pass the Dardanelles with a pennant flying at the main, and with all the parade of a ship of war, was an affront which, in their opinion, should be punished by the instant confiscation of ship and cargo.'

One can picture the grin that would adorn Captain Bainbridge's face on hearing of the escapade.

It may be well to explain, in proof of the

anomalous conditions under which United States trade with Turkish ports was conducted at this time, that, in spite of the 'Declaration of Independence' (thirty-four years earlier), American merchants still traded under the protection of the British flag, and with the connivance and approval of British consular officials; while citizens of the Republic, with a view to facilitating business, permitted themselves to be regarded by the Turkish Government as British subjects.

The reader will understand, now, why the British Representative at Constantinople considered it necessary to acquaint his own government with the above-described defiance of international etiquette on the part of a Yankee skipper. It is further interesting to note that, through our representative's interference, the 'affront' was satisfactorily explained, and the threatened 'confiscation' avoided. 'I suc-

ceeded, though not easily,' wrote Sir R. Adair, 'in preventing this act of violence.' And he wound up by asking for instructions as to whether the system of gratuitous 'protection,' hitherto accorded to American shipping, as well as to citizens of the United States residing on Turkish territory, was to be continued.

The hostilities which broke out two years later between Great Britain and the United States would naturally, one supposes, lead to the withdrawal of this 'protection' by Great Britain. There is reason to believe, however, that it still existed, notwithstanding the war, in the form 'licences to trade,' for many years, a circumstance which gives point to a remark of Sir R. Adair to the effect that, 'I do think we have a right to the thanks, at least, of the Americans for whatever we may do in their favour.' And with that expression of opinion most people will be inclined to agree.

EVERGREEN REPUTATIONS.

By H. M. FORBES.

HOWEVER interesting the lives of the illustrious, no whit less so is the study of fame itself. According to a renowned statesman, 'the world never knows its great men'; according to Bernard Shaw, Hall Caine, G. K. Chesterton (all of whom I have questioned on the subject), the number of great men who die wholly unrecognised is indisputably considerable. But, this interesting question apart, what about the reputation of the actual immortals? Why, for instance, is one name held in affectionate remembrance, while another—a worthier by far, as often as not—survives only as it were on sufferance?

The truth is, what keeps a reputation evergreen is not so much high talent, splendid services, an unimpeachable record, as that amazingly fascinating thing, a picturesque personality. This assertion in these days of biographical plays and pictures any producer would substantiate. Why is it that the public is so much more interested in Napoleon than in Lee, in Lincoln than in Daniel Webster, in Dr Johnson than in Charles Reade? Why do the masses never tire of hearing about Charles James Fox, about Charles XII. of Sweden, about Bonnie Prince Charlie? All for one identical reason—that already indicated. The hero of the people must not merely be a man of action, he must be something of an actor. To live in the heart of the multitude a great man must have some other claim to immortality than mere greatness. He must be unusual in some other sense. He must collect pieces of orange peel like Samuel Johnson; he must employ bank-notes as book-marks like De Quincey; he must stuff the carcasses of dead

birds with snow after the style of Francis Bacon; he must take to climbing church steeples like Clive; failing which, in the matter of personal magnetism, whatever else he may do, he can never hope to be one of the darlings of the gods.

The part played by love in the scheme of immortality is incalculable. Not for nothing was the adage coined—'All the world loves a lover.' The scholar loves Dante for one reason; the man in the street for another. It is the poet's passion for Beatrice, like Petrarch's for Laura, like Burns's for Highland Mary, that has fixed these great names in the minds of the educationally unredeemed. Where would Dean Swift be without his Stella, Garibaldi without his Anita, Byron without his Thyrza? It is her amazing adventures in the courts of love which keep evergreen the name of Mary Stuart. Without the youthful Dauphin, the ill-fated Chastelard, the weak-kneed Darnley, the audacious Bothwell, Mary's story would be stripped of half its fascination.

Amazing as it may seem, next to romance it is devilment which most fascinates and bewitches the multitudes! To the man in the street Fox is never so picturesque as when running up debts to well-nigh two hundred thousand, Byron as when his tame bear was causing uneasiness to the college authorities, O'Connell as when engaged in a desperate duel.

According to Macaulay, the great ladies of London society were once much fascinated by the devil-may-care tactics of a certain highwayman whose robberies were more than forgiven him on account of his gallantries. When he was at

long last captured and condemned to death, heaven and earth were moved to save him from the hangman's noose, some of the fair petitioners being the noblest in the land. The petition itself failing, the fair sought to allay their sorrow by doing homage to the remains as they rested in funeral splendour in a chamber which, for the melancholy occasion, had been superbly hung with trappings of woe!

But it was not only in the good old days that the desperado enjoyed a warm corner in the heart of the sentimental. Even to this day the name of Jonathan Wilde fascinates tens of thousands. When, a month or two ago, the writer pointed this out to Sir J. Forbes Robertson, and added that, compared with Jonathan Wilde, some even of the greatest men were regarded by the average individual with but little interest, the famous actor was anything but prepared to agree with him. If Sir Johnston would only look more closely into the question, however, perhaps he would be convinced of the truth of the argument despite himself. We have had John Wesley on the screen, and that production, though interesting, was certainly not overwhelmingly so; we have had Stonewall Jackson, Sherman, Bright, Gladstone, none of whom produced any deep or lasting impression on the public as a whole. Jonathan Wilde we have had alike on the stage and on the screen, and that gentleman has never failed to prove an unqualified success!

Let us examine the careers of one or two of those concerning whose lives the public never grow weary, and see in what exactly their fascination consists. Take Beaconsfield. A member of a then persecuted race, Disraeli's whole career reads like a glittering romance rather than an actual life-story. He fought his way into parliament when that institution was primarily the preserve of those born in the purple; in the course of a few years he produced a number of cocksure romances which were the talk of literary London, delivered a maiden speech which was the parliamentary failure of the decade, lampooned O'Connell as a coward, found time amidst a parliamentary career to marry a fortune, so tortured Peel by his pitiless invective that only with the utmost difficulty was that statesman prevented from sending him a challenge, formed a romantic attachment with a woman who ultimately left him £50,000, together with a request that she might be buried beside him, became Chancellor of the Exchequer, later Prime-minister, the universally recognised antagonist of the mighty Gladstone, won the devoted attachment of Queen Victoria, became the idol of the populace, and lastly assumed the proud title of Earl of Beaconsfield. Here is a career if ever there was one! A romance from real life that cannot but grip the popular imagination.

Take again a very different individual—Abraham Lincoln. There was nothing of the dandy about honest Abe, in all conscience, yet what could be more incredible than his amazing journey from penury to power, from hodden gray to the presidential chair! Born in a three-walled shanty in bleakest poverty, Lincoln became the spokesman of one of the wealthiest nations in the world; schooled by the brush-fire of the wilderness, he ruled at the height of his power a cabinet composed of some of the most cultured men in the American continent. In youth a gloomy dreamer, in manhood an impassioned lover of his fellow-men, Lincoln fascinates the mind no less by his homely adages than by his dominating personality. It is around this gawky colossus that the frenzied battles of the terrible Civil War seem to rage in unabating fury. Like the poetry of Shakespeare, his picturesque and stirring phraseology belongs to Time. Feared, hated, reviled, he was only beginning to be understood when an assassin's ball ended his existence, sealing with his blood the decision of the tented field. In the United States, I am told, there is hardly a home in which is not to be seen the picture of Abraham Lincoln. Small wonder!

As with men, so with women. The woman who entrances the crowd is the woman with a romantic story. Viewed wholly and simply from the standpoint of popularity, what chance has a personality such as Charlotte Brontë compared with Joan of Arc or with Flora Macdonald? It is not the Elizabeth Frys the public yearns to hear about, so much as the Charlotte Cordays, the Nell Gwynns. For the adventuress, whether in silk or in fustian, the public has a veritable passion. For sheer irresistibility few queens in all the world's history can hold the candle to Lady Hamilton.

Evergreen reputations, bless your heart! I dare swear it would be hard to find a more amazing study.

HILLS IN HEAVEN.

GOD grant there be hills in Heaven
For those who have fought their best,
For those who have struggled and striven
And look to the heights for rest.
God grant there be quiet places
And heaths where the hill-winds pass,
Where we bury our hot, shamed faces
In the cool, wet mountain grass.

The sea with her magic portals,
The vale with her plough-turned sod—
These whisper a while to mortals,
But the peaks talk on with God.
To the yeomen their fields be given;
And the captains—give them their sea!
But I pray there be hills in Heaven
To stand through Eternity.

WILL H. OGILVIE.

HOW SERGEANT MILLEFEUX WON THE CROSS.

By ALEXANDER BIRD.

PART I.

I.

THE Cross of the Legion of Honour—the gold cross with its red ribbon—ah, that was the dream we all had in our minds in the days of the great Emperor. Every time I went into a battle I used to say to myself, 'Now for the Cross!' But it never came to me in battle, though I have been in many battles. What is more, it did not come by the way of Success; it came by the bitter road of Failure. That is a strange thing. Listen, and I will tell you all about it.

The year 1814 was a black year for the Emperor, for it ended in his abdication and his banishment to Elba. But there was many a tough fight and many a brilliant victory before that came to pass. However, the year began as it meant to end, for we were defeated at La Rothière—if to lose a battle to three times your number can be called defeat. The army fell back to Troyes, and there we halted and sat staring at the Austrians, and the Austrians sat staring at us, with the river Seine flowing between us.

At first everything was in confusion. The soldiers were mostly young conscripts, and the lost battle and the retreat had told heavily on their spirits. And the weather was horrible—snow and sleet and cold, all the misery of a bad February. However, we got rest and time to pull ourselves together. The river, you see, sheltered us from the Austrians, and when they saw us on the other side they thought it best to leave us alone. After all, the Austrians are a very sensible people.

Well, as I said, there we were, with the whole Austrian army before us; we too weak to attack them, and the enemy's generals puzzling their heads as to how they were to get over the broad river and attack us. That was satisfactory so far—if we had not driven the Kaiserlicks out of France, at least we had brought them to a dead stop.

But, after a while, some ugly rumours began to run through the army. It was said that that villain Blücher had made up a second army of Prussians and Russians, and that he was marching, miles away on our left, along the river Marne to Paris. Of course, if that was so, there was nothing to stop him. The road to Paris would lie open before him, for the Emperor and all the rest of us were nailed to Troyes facing the Austrians.

Things were like this when one evening I was sitting in the parlour of the Rose d'Or drinking *vin sucré*, and playing *vingt-et-un* with

Sergeant Brun. I was unlucky at the cards that night, and I had lost my last sou—five francs altogether—when the door opened and Captain Videlle came into the room. 'Sergeant Millefeux,' said he, 'you are wanted. Come with me.'

'Yes, *mon capitaine*,' said I, and I followed him out of the room. We left the tavern, and as we went down the street, he turned to me and spoke.

'It is the Emperor,' said he, in a whisper. 'I fancy there is something in the air.'

II.

We marched along till we came to a large château just outside the town. A picket of the guards was on duty at the doorway. Just inside the door a young Hussar officer met us. The captain said a few words to him, and then he turned to me. 'Sergeant,' said he, 'follow Lieutenant Dupré, and he will take you to His Majesty.' I clicked my heels and saluted, and he went off, leaving me to the lieutenant.

Lieutenant Dupré had a very pleasant face, and his gay uniform suited him very well; but we of the Old Guard had a very proper contempt for those gaudy Hussars. However, he was an officer, and it does not do to say all you think; otherwise the world would stand still.

He led me up a noble staircase lighted with great silver candelabra, with tall candles throwing a soft light on the splendid carpet which covered the steps. At the head of the stairs we entered a long passage, at the end of which was a large door beautifully carved in oak. The lieutenant went up to the door and rapped with his knuckles; then he opened it, and we both entered.

It was a large room, and there was a cheerful fire blazing in a large open fireplace. Marshal Berthier sat writing at a large table. Berthier was the chief-of-staff, and it was said of him that when he wrote out Napoleon's instructions for a complicated manœuvre his words were so clear that you felt as if you were looking at a plan. This is what I have been told; I cannot say anything about it myself, of course. In any case, blows are more in my line than words. Standing before the fire with his coat-tails under his arms was the Emperor himself. He looked very thoughtful, and as we came into the room he fixed his eye on me.

'Sergeant Millefeux, sire,' said the lieutenant.

I stood up straight and saluted.

'Ah, Millefeux,' said the Emperor, 'it is you, is it? You are looking very well, Sergeant

Millefeux. You are beginning to grow quite stout.'

'It is because I have nothing to do, sire,' I replied. 'It's quite a week since the last battle.'

'Ah,' said he; 'and I hear you keep your hand in with duelling. Now, sergeant, that sort of thing must stop. It is no use for me to rake France for reinforcements if you spend all your time in putting them into hospital.'

Now, it was quite true that I had had a little affair with a certain captain of Dragoons, so I said nothing.

The Emperor stopped talking and looked at me more fixedly, and I could see he was thinking of something more important than a duel. Suddenly he took a step forward and grasped me by the arm. 'Sergeant Millefeux,' he said, 'would you like to win the Cross?'

His manner startled me, but when he mentioned the Cross, I could feel my eyes blazing. 'Sire!' I gasped; 'the Cross!'

'Ah,' said he, 'I thought that would suit you.' Then he left hold of my arm and resumed his position at the fire, with his coat-tails under his arms again. 'Sergeant,' said he, 'you are one of the most determined men in the army, and it is high time you had the Cross. Now, listen. I am going to send you on a dangerous journey. I give you fair warning; it is a very dangerous journey. Of course, if you are afraid you need not go.'

He stopped at that and looked at me very hard. And I looked at him. A sea of emotion choked me. Indignation, astonishment, went over me like a flood. *Moi*, Sergeant Millefeux of the Old Guard, afraid, and not wishing to go where I could get the Cross!

And then the humour of it seized me, and I burst out in peals of laughter. Yes, though it was the Emperor who stood before me, I could not help it. I laughed till I shook. And at that the Emperor started to laugh as well. And then the thing spread. I could hear the lieutenant in fits behind me, and even from the table there came a snigger from that dried-up fossil of a man, old Marshal Berthier.

Then it suddenly struck me what I was doing, and I became grave again. 'Pardon me, sire,' I said.

Napoleon took out his snuff-box and helped himself to a pinch of snuff. Then he offered the box to me. Yes, Napoleon Buonaparte offered me a pinch of snuff. And, though I was astonished, I had the sense to fall in with his humour, and took a pinch out of the Emperor's gold snuff-box quite calmly, as if it was the most ordinary thing in the world for an emperor to take snuff with a sergeant.

III.

'Now,' said Napoleon, 'we will get to business.—Lieutenant,' he continued, turning to the Hussar, 'bring those boots.'

Lieutenant Dupré went to a corner of the room and brought a pair of boots, which he placed before me.

'Put on those boots, Millefeux,' said the Emperor.

I need hardly say that I was astonished. But it seemed to be a night of surprises. So I took off my shoes and put on the boots, and a very fine pair of boots they were, brand-new, and they fitted me excellently.

When I had finished I stood up again, and the Emperor resumed. 'There is a despatch in the heel of your right boot, sergeant,' he said. 'It is a very important despatch, and I have chosen you to carry it because you are the most determined man in my army. I think I told you that before. Well, you will need all your determination, for to-morrow night you will be put across the river at midnight opposite the Forest of Troyes. The forest will be full of Austrian soldiers. You must get through them as best you can, but if you are attacked you must defend the despatch to the last gasp. You understand—to the last gasp. You must give up your life before the Austrians get the despatch. If you succeed in getting through the Austrians, you will arrive towards dawn at the edge of the forest. There you will wait till a man in Austrian uniform comes to you and says the one word 'France!' To him and to him alone you will give up the despatch. When you have done that your mission is finished, and you will have gained the Cross. Do you understand all that, *mon vieux*?'

'Perfectly, sire,' I replied.

'Well, that is all, Millefeux,' said the Emperor; 'and as it will be cold work waiting among the trees, Lieutenant Dupré will give you a bottle of wine from my own cellars to take with you.'

'Thanks, sire,' I replied. Then I saluted, and followed Lieutenant Dupré out of the room.

IV.

Next day I was taken miles up the river to where a boat was waiting in charge of two men. It was quite dark by this time, which was just as well, for no doubt there would be lynx eyes on the other side of the river.

I got into the boat immediately along with the two boatmen, and we pulled off. The boat glided noiselessly into the great blackness of the night. You couldn't see the water over the side, for there was not even a star to make a reflection. Of course, this was a good thing for us, but it made a dreary business of it all the same.

Presently the boat stopped, and the men whispered to me that we were at the other bank of the river. It was as well they told me, for I should never have thought it myself. However, I put out my hand, and, sure enough, I felt the soil of the river-bank. I rose up

carefully and slowly, and, feeling with my hands, I found the top of the bank at last. Then, raising a leg, in a second I found myself ashore. I did not stop to say '*bon soir*,' but began to walk straight forward till I knocked up against a tree. And so there I was, safely landed in the Forest of Troyes.

I stood still, listening intently, but nothing stirred. Then, with my musket held ready, I began to stumble along from tree to tree. The darkness in the forest was something to be felt; and the trees rustled, and the wind moaned drearily through them. And at any moment I might find a bayonet sticking in me or be shot dead by a bullet.

It was just as well that, as the Emperor had very justly remarked, I was the most determined man in the army. With the utmost caution I went steadily on, and just as the first light was appearing in the sky, I found myself clear of the trees and a strong wind blowing round me.

You will remember that what I had to do now was to wait at the edge of the forest till I should see a man in Austrian uniform coming along. On his uttering the word '*France*' I was to hand over the despatch to him.

Well, I fancied I might as well make myself comfortable in the meantime. I was hungry and cold, and I thought with great joy of the bottle of wine which the Emperor had given me. So I sat down with my back against the trunk of a tree, and got out a sandwich which I had brought with me; and after I had made an end of that, I pulled out the bottle of wine. Ah, what wine that was! After the first mouthful I felt I would have fought harder for the rest of that bottle than even for the precious despatch itself. And to think that the Emperor had a whole cellar of it, and could help himself to a bottle or two whenever he wished! Well, I have heard much of the troubles of crowned heads, but it is certain that they have compensations.

My thoughts were running on in this way when I began to feel a delightful drowsiness stealing over me; and then I remembered no more, for I was fast asleep.

V.

How long I slept I do not know, but when I came to myself there was still a dull drowsiness on me, so that I felt as if I was looking at things through a mist. I was no longer among the trees of the Forest of Troyes. I was in a large, comfortably furnished room. Right in front of me was a table at which several men were sitting, and when I had looked for a while, I was astonished to see that they were in Austrian uniform. At first I thought it was a dream, so I shut my eyes for a moment. When I opened them again I could see more clearly; the drowsiness was leaving me quickly, and I perceived that the men at the table were

Austrian officers. They were in splendid uniform, and were clearly of very high rank indeed.

Then suddenly I thought of the despatch, and a panic seized me. Whatever had happened? I turned my head, and then another wonder revealed itself. There, at the table among all those Austrians, was a French uniform—a Hussar's uniform, and the man who wore it was no other than the Emperor's secretary, Lieutenant Dupré.

I sat and gaped with astonishment. Looking down, I saw that I was seated in a large chair, and though my arms and legs were free, there was a broad belt round my waist, which confined me to the chair.

Then there was no longer any doubt in my mind. I was a prisoner. I had not defended my despatch to the bitter end. I had not struck a single blow for it. I had been taken in a drunken sleep. Oh, the bitterness of that moment!

Then a ray of hope shone in upon me. The despatch was cunningly hidden. No one would think of looking in the heel of my boot. I had but to keep the secret, and all might still be well.

At that moment one of the Austrian officers at the table addressed me. He seemed to be the leading man there, and I put him down as a general; and well I might, for, as I learned afterwards, it was Schwarzenberg himself. He spoke in excellent French, and in a very friendly tone. '*Sergeant Millefeux*,' said he, '*I am glad to see you are now recovered. I regret we have had to fasten you up, but it is because of your reputation as the bravest man in the French army. We were obliged to take precautions therefore, but hand over your despatches and you will be set free at once.*'

For answer I only stared at him as stupidly as I could. After waiting a minute he went on. '*You understand, don't you, sergeant?*' he asked. '*The despatch with which you were entrusted.*'

'Despatch?' I replied. '*What despatch is Your Excellency speaking of?*'

'Come, come,' said he impatiently; '*we know all about it, my friend. The Emperor Napoleon has given you a despatch to deliver to one of his agents, who was to meet you on the edge of the Forest of Troyes. Your bottle of wine was drugged, so that you slept very soundly till one of our pickets discovered you. We know all about it, you see, sergeant, and we were waiting for you all the time.*'

Then a sudden light broke in upon me, and I thought fast enough for a minute or two. The wine drugged—ah, that explained how a single bottle of wine had put a seasoned cask like Sergeant Millefeux into such a profound slumber!

(Continued on page 59.)

THE MALAY.

I.

'OH, he's a lazy beggar—not much use for anything.'

This reply will be the reward of any new-comer to Malaya who asks the old hand what the Malay is like.

As *mañana* to the Spaniard, so *tid' apa* to the Malay—'it doesn't matter.'

But—there are very few Europeans in Malaya who ever get into close contact with the Malay. The planter does not. He prefers Chinese or Tamils. The merchant does not. He also uses Chinese in his office, and the Malay rather despises commerce. The government servant, however, does, as a young man—and from him much may be learned.

If you take an encyclopædia and look up Malay, you will find—'A brown-skinned, straight-haired, round-headed people, of low or medium stature, living in all the islands between Madagascar and the Philippines, but centred chiefly in the Malay Peninsula and Sumatra.' They will be described as a maritime people, of Mongoloid stock—devoid of literature or art—Mohammedan by religion. You will find the 'cursed Malayan kris' given as their 'most characteristic product,' and you will learn that they practise 'Amok.'

In all of which there is truth, but perhaps the whole truth is lacking.

Essentially the Malay is a *gentleman*. His whole outlook on life, his strong aristocratic prejudice, his polished courtesy, fondness for society, his respect for good manners, his disregard of sordid finance and penchant for gambling, all recall to one the views and tastes of a young patrician under George I., not those of a 'brown barbarian,' as he has been called. To one who knows him well, his chief characteristic is rather ingenuity than laziness. He himself has made it possible to obtain all his needs with a minimum of exertion. He lives on the richest soil in the world; his wants are few.

The Malay point of view was well expressed by a certain *Datoh*, or landowner of good birth. This *Datoh* owned some four hundred acres of very rich land on a river bank. Of this about five acres had been cleared. A little was under rice, some more under fruit trees—the rest occupied by the *Datoh's* house and those of his attendants. When questioned as to why he left the rest of his land under jungle, he replied as follows: 'Why should I clear more, Tuan? Here is my rice, here my fruit trees. My young men bring me fish from the rivers, and game from the jungle—enough, more than enough, for my household and my guest. Have you lacked aught beneath my roof? Why should I toil

for the money I do not want? Why involve myself with cares of rent, and tenants who would not pay when rents fell due? Allah, in his bounty, hath blessed me with all the desire of a man's heart. With children, with friends, with adherents; there is enough for all—why, then, should I covet more?' Why, indeed?

These children of the sun have brought the art of existing happily to a very high pitch, except in the big cities. There the greed for money exhibited by their more 'civilised' European and Chinese masters has corrupted their simple tastes.

The old days of piracy and murder have departed. The need to fight for home and land has gone, and the *parang* has superseded the kris, which is now no longer a weapon, but a symbol of birth. The *parang* is the Malay's best friend. It is a heavy curved sheath knife, from twelve to twenty inches long, with a razor edge. With it he can do—everything.

Using no other tool, he can build his house, clear his garden, plant his orchard, kill his game, and obtain the *rôtan* (rattan) cane which makes his fishing-lines and fish-traps. With it he fashions his *prahu* (canoe), clears his way through thick jungle, and, if need be, kills his enemy.

Given a *parang*, a silk 'sarong' or skirt for feast days, a cotton one for everyday wear, a Malay boy will quickly obtain the only other things he covets—a wife and a patch of land. What more could a philosopher and fatalist desire?

II.

Although nominally a Mohammedan, and in some respects a worthy follower of the Prophet, the Malay, *au fond*, remains a Pagan. His earth, water, and air spirits were propitiated by him, just as they are to-day, long before Mohammed saw the light. Islam is too stern a creed for his easy-going, laughter-loving nature, and therefore becomes much modified. His women-folk go unveiled, his attendance at the mosque is irregular; but the principal divagation from the law is that the wife can (and does) divorce her husband.

In the life of the up-country Kampong—and it were well to state here that this article deals only with the real Malay, not with the town-bred Europeanised native—the local *pawang*, or wise-man, plays a far more important rôle than the Iman, the priest of Islam. At births, marriages, even at circumcisions, it is the *pawang* who intercedes with the spirits of good and propitiates the evil ones. To him the hunter applies for information as to where the game lies—he knows the charm to be spoken over

the fishing-net or the new-born child. He is the resource of the disappointed lover, the barren wife—and the repository of the jungle lore of centuries, skilled in herbs, drugs, and poisons.

The Malay has little written history or literature, but is rich in a folklore more ingenious and delightful than anything found in *Uncle Remus*. It is not easy to get at. To ask a Malay for any particular story is to meet with a polite disclaimer. Questions are looked upon as bad manners. Whatever a man volunteers about himself should be received with polite interest, but to attempt to ascertain facts that he may not desire to give voluntarily—is not done. The seeker after folklore must be patient, and wait for his chance. It will come, probably after the evening meal on some shooting excursion. Go down to within earshot of the beaters—don't intrude into the circle round the fire—and listen. But in order to do so satisfactorily, no ordinary knowledge of the language will suffice. Malay conversation is allusive in the extreme, and constant reference is made to their proverbs. These are in the form of four-line verses, the whole point of which lies in the second two lines—never quoted in conversation, it being taken for granted that all persons present know the conclusion. One Malay will say to another :

'As a wild cat struggling
In a trap of cane'—

His friend knows the conclusion, which runs :

'Is a faithless woman
Discovered by her husband.'

But these lines are *not* quoted.

Such conversation is not easily followed. However, if the language difficulty has been overcome there are wonderful stories to be heard of birds, beasts, fishes, fairies, devils, trees, princesses, and sultans. Stories of the Creation ; of how the sea came into existence ; why the European has a white skin. It is curious, and perhaps of interest, to know that concerning this last problem exactly the same legend is current among the Malays as among the African negroes. They say that originally all men were black ; but once a hunting-party in the heart of the jungle, tired and very hot, decided to bathe in a small lake they had found, and, to their amazement, came out white. The change was approved of by their women-folk, who followed their example. They became Europeans. By this time the water was very muddy, but still the crowd came. The second batch didn't become pure white, but yellow—hence the Chinese. The next arrivals, by wallowing, became Malays ; and when they had finished there was only enough water left to turn the palms of the hands and the soles of the feet of the late-comers pink. They became Tamils.

III.

According to Malay tradition, the Nabi Sleman (King Solomon) is the lord of the animal creation. His Viceroy is the elephant. But the creature round whom most of these stories circulate is the *plandok*, or mouse-deer. He is invariably the clever fellow who scores off all the others. Mr G. Maxwell, in his delightful book, *In Malayan Forests*, has already translated a number of these legends in a manner that admits of no improvement. Still, one of them concerning the domestic cat may not be out of place here. The Malay cat has invariably a kink in the end of its tail, either at the very end, or about an inch from the tip. Hence the following legend :

Once upon a time a mighty Sultan dwelt in a beautiful palace on the banks of a great river.

The Sultan was blessed with many children, and among them a daughter of unrivalled beauty, on whom His Highness lavished all the gems of his treasury.

Each day the Princess went down to the river to bathe, at sunrise, mid-day, and sunset, and Mukh, her pet cat, went with her, for Mukh had an important duty to fulfil at the river side.

When Her Highness was ready to step into the water she would slip off her jewellery, and thread her rings on the cat's tail. The faithful Mukh would then stand on the bank, tail erect, until his mistress had finished her ablutions.

One day, when the cat was waiting, a small, red fish came to the top of the water and began to abuse him. The cat was a poor thing, said he. Couldn't even feed himself ! Had to rely on the leavings of human beings ; a slave, no free creature. Mukh boiled inwardly, but said nothing. Day after day these insults were repeated, and day after day this 'gamin' among fishes came closer to the bank and waxed more and more insulting. At last feline patience could stand it no longer. The cat made a spring—the fish paid the penalty—but the rings were gone.

The Princess came out, and looked at Mukh, now thoroughly ashamed of himself, but went home without saying a word.

Next morning they went down to bathe again. Fresh gems sparkled on the fingers of Her Highness. Was she not the favourite daughter of a puissant Sultan ? As usual, she pulled off the rings and threaded them on Mukh's tail—but then she held him fast and tied a tight knot on the end of his tail. And the knot has been there ever since.

IV.

These stories, and also their love songs, have a certain poetry and imaginative beauty of their own, but they are rude and unfinished. The proverbs are more highly polished, and would richly reward any one who had leisure to collect them. Their music is wild and plaintive, with

the long cadences that distinguish all oriental music (except Chinese, which resembles a brass band gone mad in an ironmonger's shop). In all realms of art the Malay is the enthusiastic amateur. His silver and brass have a distinctive and simple beauty of their own, but lack detail and finish, except perhaps the work of the Trengganu Malays, which is of finer quality.

As the foregoing has shown, the Malay is temperamentally unfit for commercial success. The Kelantan and Trengganu silk-weaving industries might have been greatly developed if the craftsmen employed had only attempted to cope with the orders they received. At Port Dickson a hat-weaving industry was begun. Straw and grass-woven hats were produced, and owing to their cheapness and beauty had a *succès fou* among the ladies of Singapore and Kuala Lumpur. Orders poured in, and the Government official who had fostered the industry began to congratulate himself. Suddenly the weavers struck. It was too much of a good thing. They didn't mind weaving a few hats for the mem-sahibs now and again, but if the mems imagined they were machines for making hats they were wrong. More they would not make. They had enough money now, and didn't want more till next year!

The silk industry, however, is being ruined by the introduction of cheap Japanese and European silks, and, still worse, by the substitution of aniline dyes for the old native vegetable ones. The old silks were of considerable artistic beauty; the modern ones are not to be compared with them.

As agriculturalists and horticulturists the Malays are reasonably successful—it would be difficult to be otherwise on so rich a soil—but here again the Malay has no commercial leanings. He produces to feed himself, not to sell his produce.

V.

It seems to be a common error to regard the Malay as a sullen savage, liable to fits of manslaughter. This is hopelessly wrong. 'Amok' is very seldom met with in Malays, and is much more common among the Moro tribes in the Philippine Islands. Generally it is the result of an unfortunate love affair. The rejected suitor will brood over his discomfiture until he works himself into a type of artificial frenzy. He then binds tight ligatures of bark or cane above the ankles, knees, elbows, and below the shoulders, in order that the circulation may be impeded, and one wound on one limb will not put him out of action. He then takes his weapon, kris or parang, and proceeds to the nearest market-place or public gathering, where he will kill mercilessly man, woman, or child crossing his path, until he in turn is killed.

The Malay is not criminal by nature. Murder and theft are far more common among the Chinese

population, and the registers of the Supreme Court will show a very small proportion of Malay murderers. Generally the offender is some princeling, and the crime of the order of *crime passionnel*. The great respect in which the old ruling caste are held makes it almost a matter of impossibility to obtain evidence enough to convict.

As a sportsman the Malay is admirable, both in the jungle after big game and in the lesser fields of 'sport.' Buffalo fights, ram fights, cock fighting, fish fights, quail fights, even cricket fights, all attract large crowds of enthusiastic sportsmen ready to bet on any issue. The only forms of European sport that appeal to them are Association football and horse racing. They play a very good game of 'soccer'—bare-footed—and the Malay Police side can give any European team in the country a run for its money.

In ordinary everyday life the Malay is a very pleasant person to deal with. He belongs to one of the few races with whom it is possible to joke and laugh freely without loss of dignity. Familiarity he resents as any other gentleman of good breeding resents it, but frankness and courtesy he appreciates. He is the soul of hospitality; nothing in his house is too good for the guest beneath his roof, and even if that guest were to behave like a boor and trample roughshod over his ideas of courtesy, he would never be aware that his host thought him rude.

Young Europeans fresh from home are liable to terrible errors of this kind; they praise the looks of their host's children in the child's presence, a heinous sin, or ask after the health of his women-folk. There was one case where a youth ate bacon at breakfast beneath the roof of a Datoh. He didn't know that the Datoh in question set his young men to build a new house half an hour after his guest had departed.

In personal character the Malays have much in common with the Burmans and the Javanese, though differing seriously in national traits.

If this slight, imperfect sketch has done anything towards giving the reader a truer view of a charming and friendly race, its object has been more than fulfilled.

THE FRAIL SOUL.

SHE might have lived in some safe sheltered nook

For many years, to gladden this old world

With quaint sweet wisdom and brave merry look.

In gentle rain her leaves might have uncured,

Like some fair rose, unveiling her pure heart;

Those fragile fingers would have penned a book,

A trumpet call to Poesy and Art—

If she had lived in some safe sheltered nook.

Alas, no lady's garden held this flower!

She blossomed in no watched and tended bower!

Tossed by the winds of Heaven, scorched by the

sun,

She withered ere her life was well begun.

Too frail to struggle on the mountain side,

She gave one breath of perfume sweet—and died!

D. E. STEVENSON.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

SHESHUAN loses little of the charm of mystery from the groping, unsure publicity directed to it in these present days. Instead, it seems that an increasing awe is added to the old distinction of this elusive place secreted in peculiar solitude in a cup-shaped hollow of North African hills. Notes and cabled news concerning Sheshuan are printed almost daily in the newspapers, informing us upon what is rumoured of the state of things at that strange region where black and barren pinnacles stand guard over one of the gentlest, most secluded spots that man has ever chosen for a dwelling place. Only hearsays are printed, and that sometimes at second or third tongue—for few except Spanish soldiers and Moors, with rights of habitation or privilege to visit, have ever been to Sheshuan. Years ago the world's chief mystery place seemed to be Lhassa of Thibet; but then a military party, risking something, adventured there, and in a certain sense we have done with Lhassa now, and its grand Dalai Lama has lost something of the prestige in mystery which he held among the Europeans far away, who, by grace of printer's type and ink and their flighty fancy, travel to the wonder places of the world. Upon Sheshuan, at the western border of the Riff in Spanish Morocco, the secret honours of Lhassa seemed in a manner to descend. Perhaps there is more credit, as one might say, to a city of mystery in holding itself inviolate when near to Europe—not more than fifty miles from a coast from which Gibraltar may be seen across the Mediterranean—than was due to some place tucked away in Asiatic uplands. And even though Spaniards and French have been for a long time past within the sound of guns, Sheshuan has stood immaculate in Moorish mediævalism, holding complete and self-contained a thin civilisation of its own, knowing not newspapers or telegraphs, or even books of any kind, its very chiefs not having heard of socialism or Soviets, content with its state, no yearning for what we call progress. Its people have been well fed and clothed according to their needs; its epicures have had their meats prepared in a manner to delight them; the inhabitants have been well housed and at least as clean as they

wished to be. Work and trade have been practised within a comfortable measure. The general garment of the Moors for rough and everyday wear is what is called the jilaba, made of rough, brown cloth, and in character something like a sack with wide sleeves and a hood for the worse weather. Moors in many parts of their country make these special cloths, but Sheshuan has always had a reputation of its own, its well-made stuff, in colour of a dotted mixture, being famed among the surrounding tribes. Another detail of Sheshuan manufacture attracting my attention has been the peculiar fans for cooling in hot weather and for whisking the flies away. Every North African town and community seems to have a special taste and utility of its own in this matter, which is more important than can be understood by those who have not dwelt in such lands in July. Where the palm thrives, as in Tunisia, and the people in the towns are skilled, there are natty things of plaited straw fastened flag-wise to a stick that has been delicately turned and smoothed in a primitive lathe, and sold for the equal of a couple of pennies. In Sheshuan are no palms, but there are flies, and the natives, to beat the nuisance, make their own fly-scatterers in the form of a diamond frame, perhaps five or six inches from point to point, across which coloured silks are threaded in a plain pattern of lines. It is like a sign of taste. Of course babuches, or yellow Moorish footwear, are made here as everywhere, and other simple essentials, and, in considering thus the resources of the place, the water must be mentioned, for it is famous in Morocco for its purity and pleasant touch upon the palate. Many times blessed is Sheshuan in this matter, for the gift of good water at any place in North Africa comes direct from the gods.

* * *

So, lonely and mysterious as it has been, Sheshuan has yet possessed much, and I have been touched with sympathy for it, on hearing mention of the possibilities of 'progress' being applied. For ten years or more—but very definitely for ten years—I have distrusted Progress in forms by which it is insidiously presented, for has not this vaunted Progress, with its discoveries and inventions so regularly

applied to the murderous arts and sciences of war, caused too much destruction and unhappiness? And now, when peace of a kind reigns in most civilised places, is not deceitful Progress being pressed to gather from the unknown some discoveries that will later lead to human butchery on a vaster scale than was conceived of in the late Great War? Should we not sometimes regard our telephones, the wireless business—all connected with advanced chemical and electric science—with a certain unfriendliness since, though innocent in themselves, they are the allies in science of the murdering things, and all are entered in the scheme of Progress, trusty and most valued henchman of the blood god Mars? So when people say that places like this Sheshuan would be better for a little 'progress,' and that such may be applied to them soon, I feel that there must be some stupidity and corruption of the soul to start such a notion. The fanatics of this Progress also would 'educate' the simple people there, so that in time they would produce new theories of government and liberty for themselves, and then they would ascend to that pinnacle of 'progress' and understanding indicated in 'the Strike.' The five or six thousand folk in Sheshuan, mostly of the Ajmas tribe, do not yet know what a strike is, and have not practised the idea in any form. And, despite various tribulations of a simple kind, the people are mainly happy, even very happy, and want none of our belauded Progress, with its wars, its civil strife, its torturing taxation, and the fear of life that it engenders. Give Spaniards credit for this, that for the four years they have exercised a delicate control over Sheshuan, they have interfered with hardly anything, have introduced nothing of Progress that was not in the full sense necessary and acceptable to the people, and have touched this secret Sheshuan lightly and tactfully with their civilised fingers. The telegraph has come to Sheshuan, also the electric light, and I have even seen a small cinema show in one of the narrow streets. One afternoon in the quarter where are all the little shops like cupboards I needed matches, and having bought some, found that, strangely, they had come from a famous manufactory in England! Nowhere else in Morocco had I discovered their like exactly.

* * *

The idea of the secret Sheshuan is this, that it was founded in 1471 by a number of Moors, led by Mulay Ali Ben Rached, many of whom had been driven from Andalusia in southern Spain, and were fearful that Christians would make raids and excursions from their base on the coast at Ceuta, and persecute them more. They sought for a place far from Ceuta which would allow them isolation, security, safety; and lo! when they discovered this spot, like a scooped-out hollow in the hills, a veritable cup,

it seemed to have been provided miraculously for them. It could not be seen from far or near, not until the traveller, raider, or whoever he might be, had come right upon it. Here in joy and hope they built this town, gave it much of an Andalusian model and character, raised up several mosques, built houses like those in which the Moors had dwelt in Spain, with a wide central plaza. They garnished it according to their fancy and delight; they placed in it all the comforts and conveniences they knew. Then they settled down to their peace and tranquillity. In the centuries that followed only one stranger, one infidel, is known definitely to have seen Sheshuan, and that was the Viscount Charles De Foucauld of France, who long ago adventured to its walls, disguised as a wandering begging Jew, and accompanied by a real Hebrew. He was enchanted by the luxuriousness of the gardens and orchards surrounding the town, but was afraid to attempt an entry. Stealthily he crept away. So none but the Moors saw the town within the walls until the 14th of October 1920, when, after a campaign of many weeks' duration over the mountains and along the passes from Tetuan, the Spanish General Berenguer reached the gates and demanded surrender, which was peacefully made. The occupation was necessary to the Spaniards in pursuit of the task laid upon them in Morocco, but they effected it with consideration and tact. At the time I was not far away, and a little later, when back in Tetuan, General Berenguer, the High Commissioner as he was, insisted that if I wished to see and know the daintiest place in all Morocco I must go there, and for his part he would allow me a military escort for the going. Circumstances hindered me at the time, but recently I gained the long desire. With two officers of the Spanish general staff I made the journey, with sundry adventures, through the hills from Tetuan. We came to the Zoco el Arbaa, a strongly fortified post, which has been in the midst of all the fighting between the Spaniards and the Riffain rebels lately; we skirted along the Wad Lau, and sometimes we looked up uneasily at the craggy peaks from which Moorish sharpshooters have been picking off their enemies in this war, and even then had begun to do so. At last, with Dar Akoba passed, Colonel Santiago whispered that I was almost at the gates and walls of Sheshuan, though still nothing but those savage hills was visible. And then we rose over the shoulder of a hill as a swimmer might be heaved above and past a wave, and there before us was Sheshuan, like a big white speckled bird resting peacefully in its nest. The Baja, named El Uafi—a Moor of much prestige and influence, who, as reward for great services the Spaniards had installed there as master of the town—came attired in a snowy burnous to the main gate to bid us welcome, and we entered in. From then, until the hour of departure

came, emotions flashed in me as they have hardly done when visiting any other place, however distant or inaccessible, however much renowned. Now, when the war between the Spaniards and the Riffains is being hotly pursued, there are continual reports that Sheshuan, which has been beleaguered, is in danger of falling. Some of the Moors covet it for their exclusive own again; they would gather it to its old isolation, its secrecy. A Spanish friend writes to me from Morocco: 'Only two or three of you British people have ever entered into this delightful Sheshuan, and if things go ill for us, it may well prove that of these you are the last, that in our time at least no other will be permitted to look upon this chaste sweet spot that we Spaniards have loved purely and have not defiled, that we should lose with sad and bitter heart. You, my friend, at least do understand.' Some premonition of such a possibility seemed to be touching lightly, suggestively, on a dreamy mind when in the heat of that afternoon I lay resting on my bed in the chamber offered me in the little palace, as they called it, reserved for the use of the High Commissioner when visiting Sheshuan. It had been the mansion of one of the native nobles of the place, and was yielded to Berenguer in appreciation of his nice consideration. It embraced a square patio, open to the deep-blue sky, one side in white-gold sunlight, the other in gentle shadow, swallows flashing from the ether, and almost fanning with their wings my face as I leant for a moment upon the rails of the surrounding gallery, from which doors led to the chambers. Through one such door I entered to a cool apartment where a writing-table was set out for me. One wall was made entirely of a wooden screen from floor to ceiling, panelled in Moorish style, painted in red, blue, green, and yellow. One of the panels was a door, just body width, and through it was my sleeping chamber, plain white, with an arch across the ceiling and a tiny window from which I might glance over orange trees nearly within my reach to the plaza beyond. The common stillness pervading when the heat of the Moroccan summer heightens in the afternoon seemed here intensified. Not a sign of movement; not a sound. Alone in this little chamber in the 'secret city' that for nearly five hundred years had stood far back from the rest of the world and its civilisation! This was surely the most delicious perfection of solitude and isolation. London then seemed farther from me than the sun, the moon, and the stars. Independence, the sense of freedom and tranquillity were delightful. I lay down on the little bed, thinking that I would surely like to live there always, just like that. Fading reveries thinned to silken fancies, and onto the edge of dreams. I thought I heard some notes of the song of a bird. Perhaps it was not a bird; perhaps there was no sound. It mattered nothing. . . .

El Uafi sent his servant to bid me to his house for a Moorish tea in the cool of late afternoon, and my companions were asked likewise to meet the officer commanding the Spanish garrison that was established outside the walls. El Uafi is delightful, and nothing less. He has the round, genial features of the high-class Moor, softly and closely bearded, with specially clear skin of a pale olive tint, and sharp black eyes. The type is common among the Moorish chiefs of great intelligence; but El Uafi exceeds type by a manner of peculiar benevolence. When Spaniards desire to indicate that one of their friends is a man of much human kindness and goodwill, such an one as we ourselves might call an exceptionally good fellow, they say that he is '*muy simpatico*.' El Uafi, then, is intensely '*simpatico*.' One of his ways of showing it is in bending forward slightly whenever in conversation with a friend, in the manner of a most appreciative man, intent on a perfect understanding and sympathy. In a full measure he is the father of the city, the kindly chief of Sheshuan. When he walks through the plaza and the narrow streets the children, and the old men too, will steal close up to him and, bending, kiss his hand. They know him as a disciplinarian, but just and generous, seeking always for the good of Sheshuan. At the same time he is deeply attached to the Spaniards, and believes in them. He has affection for General Berenguer. His ambition is to pay homage at the feet of King Alfonso, whom he has never seen, but for whom his distant adoration is only less than that for Allah the Most High. And now the news I have is that El Uafi has girded his soldier's things about him and gone up into the hills by Sheshuan to lend a hand in fighting. We took our Moorish tea that afternoon in a bower of orange and jasmine in his garden overlooking the plaza. Through an embrasure in the wall we could see all that happened in the heart of the town. The military band was assembled, and was playing softly some airs of Andalusia. Moors were lolling in the shade; some sat on the steps of the mosque on the far side; a few were sauntering through, and here and there a burdened ass was driven by. The pervading manner was softly languorous. On the floor at one end of the bower the Moorish tea-maker was squatted on a carpet with all the instruments of his high rites about him, glass vessels of red and green for tea and mint, massive silver trays, a tall samovar of silver likewise for heating water, and dainty gilded glasses. With a still and solemn look, as of one who was dealing with almost sacred things, the tea-maker passed his thin, white hands from one vessel to the next in the manner of a conjurer, or one designing an incantation, or making impositions of a charm. Then a cup was filled

with the minted tea, and a tall negro slave, a big-limbed giant, who might have come straight from a palace of Nubian kings, wrapt in a close white garment girded about the middle, passed to the guests the glasses of the confection, amber-coloured, sweetly-scented. A taste for such tea has to be acquired, but then it is delicious. The slave passed round to each of us as we needed it the silver maracha or sprinkler containing the azhar or orange-blossom water to sprinkle upon our hands or head, and to flavour the tea as well. One serving of the tea being sipped away, the watching slave upon the instant took the glass to be refilled. And once again, for it is the law of hospitality that three of them, not more, not less, shall be quaffed at a sitting. Many times and in many places I have taken these Moorish teas, but that in El Uafi's bower will be remembered longest of them all. The Baja sat in a corner, and we chattered in an easy pleasure. Then at a lull he rose, and calling me to him, placed in my hands a marvellous Moorish rifle, hundreds of years old, the prized weapon of some great chief of ancient Sheshuan. It is nearly six feet long. Its barrel is sheathed in decorated brass; its butt is based with a block of ivory and inlaid with mother-of-pearl and silver filigree. Lock and trigger are of cunning and ancient mechanism; the whole is a marvel of old Morocco. I supposed at first that it was intended I should only look and admire; but El Uafi made the signs of gift, and here is the relic by my writing-table, while he is in the hills.

* * *

When the sun was setting, the Baja, having placed upon my finger a silver ring wrought in Sheshuan, led me outside the walls to walk with him along a romantic path twined on a ledge above a deep chasm. Far down in the depths ran a silver stream, at the banks of which in the dimming light could be discerned some Sheshuan women in their snowy haiks washing things in the flowing water. So small they looked so far below, and white, and flitting here and there, that just like dainty birds they seemed, and faintly from the depths, to aid illusion, came the twittering of their voices, for it is just twittering always with these Moorish women. Rising sheer and high above us, rough and craggy, sharp at points, fierce but protective, was the Mago, Sheshuan's close guardian mountain, on whose slopes monkeys skip. Farther away, to the left of the big red sun, was the Miskrela mountain, on whose summit was a dominant military post of which, for its gallant and successful work, the Spanish officers speak with affection. Grandly majestic, nothing less, was this rapturous scene. Moments of contemplating silence, and then we moved along the ledge, and, turning a corner, beheld spread out on the path a rich carpet, on which the tea-maker was

seated, solemn, engaged already upon his rites, with the tall silver samovar, the trays and vessels, and gilded cups and all complete, all from the palace of the Baja! Some Spanish officers came to join us. We sat on the crags and stones as we sipped the tea again three times. A sense of a great grandeur came to us; we could speak only of fine and romantic things, and, as the short twilight was lapsing down to darkness, we picked our way back into the town, halting for a moment at the stables to admire the new breed of horses that is being fostered in Morocco, blend of the Arab and the Spanish. You will perceive that I have not appraised too high the social charm of my friend, El Uafi, Baja of Sheshuan.

* * *

Somewhere about midnight I was bidden to his home again. A party was assembled in his salon, a long narrow chamber, thickly carpeted, with Moorish cloths in colours and panel shapes upon the walls, and cushions on the floor around. In a gilt frame was hung a large portrait of the King; there was a picture of General Berenguer also. The Baja bade me sit in the chief place at the end of the room, and he came by me to gossip in his broken Spanish as again we took three cups of the minted tea, sprinkled the azhar, and smoked our cigarettes. He set before us a silver censer in which perfume chips from the East were smouldering, the fumes ascending to our nostrils with insidious appeal. At the other end of the chamber a native musician appeared, clad in white burnous, holding a violin. He sat down upon the carpet, stood the violin upright on the floor, its back to him, and thus, fingering the strings at arm's length and drawing the bow like a saw across in the manner common to these Moorish musicians, began a wailing tune like those we sometimes hear in Andalusia, long and sad, and the same all through, and strangely touching in its mournfulness. A variation followed, another musician came, and then a long solemn song or chant began and was carried on for several minutes. It was a song like those of the Andalusians, this one telling of the heroic march of General Berenguer to Sheshuan. Through its mystery and pathos, and perhaps, as some would say, its crudity, one could sense the theme; the hardships of the march, the struggling on and on through the Moorish wild, sorrows and pain, and even something of the love of country, for the pathetic strain suggested much of this. . . . About four in the morning, from sleep in bed I half awoke, drowsily, through sounds of some faint music, soft and a little sad again. It seemed at first to be a dreaming fancy. I awakened more, and the strains were clear, piped gently from a musette of the kind the Arabs play. For sureness I rose and, flinging wide the little window, looked and

listened out into the dark-blue, starlit night. The music rose from the garden softly and more softly, and then in a while it ceased. I returned to sleep again. Next day I told my friends, the Spanish officers, of the music in the night, and they smiled in kindly sympathy. My emotions had been overwrought, they said, and it was only in a dream I leaned listening at the casement. I asked El Uafi, and he said the same; but for one deciding second I caught a confessing glance in his smiling eyes, and I knew. Denials and denials, but it was a Moorish serenade by order of the Baja I had heard.

* * *

On the morning of departure I rose from my bed just before the sun came up for day, and, mounting to the flat roof of my little palace, waited. Stillness and tranquillity everywhere. A soft, limpid mist, with umbrous shadows, lay upon the plaza. Soon, as by the first tentative notes of a grand, romantic overture, the theme of the rising sun began, and movement started. In a shed not far away I could discern and hear the butchers at their quartering business, first of the day's workers in Sheshuan, a sign that for living we must eat. Then through the dissolving mist some of the faithful

were seen pacing through the plaza to the mosque, and mounting the steps thereof, and entering to beg from Allah his compassion and assistance. Light was gaining, and suddenly the risen sun shot its first beams over the high embattled walls, and touched with points of gleaming gold the topmost stones of the alcazaba, verily as if heavenly lamps were being set to shine. Then the minaret was sparkled up, and in a fast succession these glorious lamps of day were lit everywhere and dazzled over the lingering shades. Some minutes more, and the commanding sun was high, and all Sheshuan abounded with the brilliance of life and day. Such a sunrise I shall not see again. . . . So did I penetrate to the secrecy and the mystery of Sheshuan. Perhaps such thoughts and notes as these may explain something of the dim references to this strange place appearing constantly in our newspapers. At least, as from one who knows, has seen, and is of independent mind, let it be believed that the Spanish work in these parts is brave and good, and not by any means as it is otherwise represented by some who have prejudice, and through propaganda have interests that must be served.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER II.—*continued.*

THE figure that presently appeared before them was a small man, about fifty years of age, with a great breadth of shoulder and a massive face decorated with a wispish tawny beard. His mouth had the gravity and primness of an elder of the kirk, but his shrewd blue eyes were not grave. The son of a Tweeddale shepherd, who had emigrated years before to a Cheviot farm in Sutherland, he was in every line and feature the Lowlander, and his speech had still the broad intonation of the Borders. But all his life had been spent in the Highlands on this and that deer forest, and as a young stalker he had been picked out by Jim Tarras for his superior hill-craft. To Archie his chief recommendation was that he was a passionate naturalist, who was as eager to stalk a rare bird with a field-glass as to lead a rifle up to deer. Other traits will appear in the course of this narrative; but it may be noted here that he was a voracious reader, and in the long winter nights had amassed a store of varied knowledge, which was patently improving his master's mind. Archie was accustomed to quote Lithgow for most of his views on matters other than ornithology and war.

'Do you mind going over to that corner, Wattie, and shuffling these slips.—Now, John, you draw first.'

Mr Palliser-Yeates extracted a slip from

Lithgow's massive hand. 'Glenraden,' he cried. 'Whew! I'm for it this time.'

Leithen drew next. His slip read Strathlarrig.

'Thank God, I've got old Claybody,' said Lamancha. 'Unless you want him very badly, Ned?'

Leithen shook his head. 'I'm content. It would be a bad start to change the draw.'

'Sit down, Wattie,' said Archie. 'Here's a dram for you. We've summoned you to a consultation. I dare say you've been wonderin' what all this fuss about secrecy has meant. I'm goin' to tell you. You were with Mr Tarras, and you've often told me about his poachin'. Well, these three gentlemen want to have a try at the same game. They're tired of ordinary sport, and want something more excitin'. It wouldn't do, of course, for them to appear under their real names, so they've invented a *nom de guerre*—that's a bogus name, you know. They call themselves collectively, as you might say, John Macnab. John Macnab writes from London to three proprietors, same as Mr Tarras used to do, and proposes to take a deer or a salmon on their property within certain dates. There's a copy of the letter, and here are the replies that arrived to-night. Just you read 'em.'

Lithgow, without moving a muscle of his face, took the documents. He nodded approvingly

over the original letter. He smiled broadly at Colonel Raden's epistle, puzzled a little at Mr Bandicott's, and wrinkled his brows over that of the Edinburgh solicitors. Then he stared into the fire, and emitted short grunts which might equally well have been chuckles or groans.

'Well, what do you think of the chances?' asked Archie at length.

'Would the gentlemen be good shots?' asked Lithgow.

'Mr Palliser-Yeates, who has drawn Glenraden, is a very good shot,' Archie replied, 'and he has stalked on nearly every forest in Scotland. Lord Lamancha—Charles, you're pretty good, aren't you?'

'Fair,' was the answer. 'Good on my day.'

'And Sir Edward Leithen is a considerable artist on the river. Now, Wattie, you understand that they want to win—want to get the stags and the salmon—but it's absolute sheer naked necessity that, whether they win or lose, they mustn't be caught. John Macnab must remain John Macnab, an unknown blighter from London. You know who Lord Lamancha is, but perhaps you don't know that Sir Edward Leithen is a great lawyer, and Mr Palliser-Yeates is one of the biggest bankers in the country.'

'I ken all about the gentlemen,' said Lithgow gravely. 'I was readin' Mr Yeates's letter in the *Times* about the debt we was owin' America, and I mind fine Sir Edward's speeches in Parliament about the Irish constitution. I didna altogether agree with him.'

'Good for you, Wattie. You see, then, how desperately important it is that the thing shouldn't get out. Mr Tarras didn't much care if he was caught, but if John Macnab is uncovered there will be a high and holy row. Now you grasp the problem, and you've got to get busy and think it out. I don't want your views to-night, but I should like to have your notion of the chances in a general way. What's the bettin'? Twenty to one against?'

'Mair like a thousand,' said Lithgow grimly. 'It will be verra verra difficult. It will want a deal o' thinkin'.' Then he added, 'Maister Tarras was an awfu' grand shot. He would kill a runnin' beast at fower hundred yards—ay, he could make certain of it.'

'Good Lord, I'm not in that class!' Palliser-Yeates exclaimed.

'Ay, and he was more than a grand shot. He could creep up to a sleepin' beast in the dark and pit a knife in its throat. The savages in Africa had learnt him that. There was plenty o' times when him and me were out that it wasna possible to use the rifle.'

'We can't compete there,' said Lamancha dolefully.

'But I wad not say it was impossible,' Lithgow added more briskly. 'It will want a deal o' thinkin'. It might be done on Haripol—I wadna say but it might be done; but yon auld

man at Glenraden will be ill to get the better o'. And the Strathlarrig water is an easy water to watch. Ye'll be for only takin' shootable beasts, like Mr Tarras, and ye'll not be wantin' to cleek a fish? It might be not so hard to get a wee staggie or to sniggle a salmon in one of the deep pots.'

'No, we must play the game by the rules. We're not common poachers.'

'Then it will be verra verra difficult.'

'You understand,' put in Lamancha, 'that, though we count on your help, you yourself mustn't be suspected. It's as important for you as for us to avoid suspicion, for if they got you it would implicate your master, and that mustn't happen on any account.'

'I ken that. It will be verra verra difficult. I said the odds were a thousand to one, but I think ten thousand wad be liker the thing.'

'Well, go and sleep on it, and we'll see you in the mornin'. And tell your wife I don't want any boys comin' up to the house with fish. She must send elsewhere and buy 'em. Good-night, Wattie.'

When Lithgow had withdrawn, the four men sat silent and meditative in their chairs. One would rise now and then and knock out his pipe, but scarcely a word was spoken. It is to be presumed that the thoughts of each were on the task in hand, but Leithen's must have wandered. 'By the way, Archie,' he said, 'I saw an uncommon pretty girl on the road this afternoon, riding a yellow pony. Who could she be?'

'Lord knows!' said Archie. 'Probably one of the Raden girls. I haven't met 'em yet.'

When the clock struck eleven the host arose and ordered his guests to bed. 'I think my toothache is gone,' he said, switching off his turban and revealing a ruffled head and scarlet cheek. Then he muttered, 'A thousand to one! Ten thousand to one! It can't be done, you know. We've got to find some way of shortenin' the odds!'

CHAPTER III.—RECONNAISSANCE.

ROSY-FINGERED Dawn, when, attended with mild airs and a sky of Italian blue, she looked in at Crask next morning, found two members of the household already astir. Mr Palliser-Yeates, coerced by Wattie Lithgow, was starting with bitter self-condemnation to prospect what his guide called 'the yont side o' Glenraden.' A quarter of an hour later Lamancha, armed with a map and a telescope, departed alone for the crest of hill behind which lay the Haripol forest. After that peace fell on the place, and it was not till the hour of ten that Sir Edward Leithen descended for breakfast.

The glory of the morning had against his convictions made him cheerful. The place

smelt so good within and without, Mrs Lithgow's scones were so succulent, the bacon so crisp, and Archie, healed of the toothache, was so preposterous and mirthful a figure, that Leithen found a faint zest again in the contemplation of the future. When Archie advised him to get busy about the Larrig he did not complain, but accompanied his host to the gun-room, where he studied attentively on a large-scale map the three miles of the stream in the tenancy of Mr Bandicott.

It seemed to him that he had better equip himself for the part by some simple disguise; so, declining Archie's suggestion of a kilt, he returned to his bedroom to refit. Obviously the best line was the tourist. Accordingly he donned a white shirt and a stiff dress collar, with a tartan bow-tie contributed from Sime's wardrobe. Light brown boots in which he had travelled from London took the place of his nailed shoes, and his thick knickerbocker stockings bulged out above them. Sime's watch-chain, from which depended a football club medal, a vulgar green Homburg hat of Archie's, and a camera slung on his shoulders completed the equipment. His host surveyed him with approval.

'The Blackpool season is beginning,' he observed. 'You're the born tripper, my lad. Don't forget the picture-postcards.' A bicycle was found, and the late Attorney-General zig-zagged warily down the steep road to the Larrig bridge.

He entered the highway without seeing a human soul, and according to plan turned down the glen towards Inverlarrig. There, at the tiny post-office, he bought the regulation picture-postcards, and conversed in what he imagined to be the speech of Cockaigne with the aged post-mistress. He was eloquent on the beauties of the weather and the landscape, and not reticent as to his personal affairs. He was, he said, a seeker for beauty-spots, and had heard that the best were to be found in the demesne of Strathlarrig. 'It's private grund,' he was told, 'but there's Americans bidin' there, and they're kind folk and awfu' free with their siller. If ye ask at the lodge, they'll maybe let ye in to photograph.' The sight of an array of ginger-beer bottles inspired him to further camouflage, so he purchased two, which he stuck in his side-pockets.

A little east of the bridge of Larrig he came to the falls in the river, above which, he knew, began the Strathlarrig water. The first part was a canal-like stretch among bogs, which promised ill for fishing; but beyond a spit of rock the stream curled in towards the road edge, and ran in noble pools and swift streams under the shadow of great pines. This, Leithen knew from the map, was the Wood of Larrimore, a remnant of the ancient Caledonian forest. By the water's edge the covert was dark, but towards the roadside the trees thinned out, and

the ground was delicately carpeted with heather and thymy turf. There grazed an aged white pony, and a few yards off on the shaft of a dilapidated fish-cart sat a small boy.

Leithen, leaning his bicycle against a tree, prospected the murky pools with the air rather of an angler than a photographer, and in the process found his stiff shirt and collar a vexation. Also, the ginger-beer bottles bobbed unpleasantly at his side; so, catching sight of the boy, he beckoned him near. 'Do you like ginger-beer?' he asked, and in reply to a vigorous nod bestowed the pair of bottles. The child returned like a dog to the shelter of the cart, whence might have been presently heard the sound of gluttonous enjoyment. Leithen, having satisfied himself that no mortal could take a fish in that thicket, continued up-stream till he struck the wall of the Strathlarrig domain and a vast castellated lodge.

The lodge-keeper made no objection when he sought admittance, and he turned from the gravel drive towards the river, which now flowed through a rough natural park. For a fisherman it was the water of his dreams. The pools were long and shelving, with a strong stream at the head, and below precisely the right kind of boulders and outjutting banks to shelter fish. There were three of these pools—'The Duke's,' the 'Black Scour,' and 'Davie's Pot,' were the names Archie had given him—and beyond, almost under the windows of the house, 'Lady Maisie's,' conspicuous for its dwarf birches and the considerable waterfall above it. Here he made believe to take a photograph, though he had no idea how a camera worked, and he reflected dismally upon the magnitude of his task. The whole place was as bright and open as the Horse Guards Parade. The house commanded all four pools, which he knew to be the best, and even at midnight, with the owner unsuspecting, poaching would be nearly impossible. What would it be when the owner was warned, and legitimate methods of fishing were part of the contract?

After a glance at the house, which seemed to be deep in noontide slumber, he made his inconspicuous way past the end of a formal garden to a reach where the Larrig flowed wide and shallow over pebbles. Then came a belt of firs, and then a long tract of broken water—obviously not a place to hold salmon. He realised from his memory of the map that he must be near the end of the Strathlarrig beat, for the topmost mile was a series of unfishable linn. But presently he came to a noble pool. It lay in a meadow where the hay had just been cut, and was more like a bit of Tweed or Eden than a Highland stream. Its shores were low, and on the near side edged with fine gravel; the far bank was a green rise unspoiled by scrub; the current entered it with

a proud swirl, washed the high bank and spread itself out in a beautifully broken tail—so that every yard of it spelled fish. Leithen stared at it with appreciative eyes. The back of a moving monster showed in mid-stream, and automatically he raised his arm in an imaginary cast.

The next second he observed a man walking across the meadow towards him, and remembered his character. Directing his camera hastily at the butt-end of a black-faced sheep on the opposite shore, he appeared to be taking a careful photograph; after which he restored his camera to its case and turned to reconnoitre the stranger. This proved to be a middle-aged man in ancient tweed knickerbockers of an outrageous pattern known locally as the 'Strathlarrig tartan.' He was obviously a river-keeper, and was advancing with a resolute and minatory air.

Leithen took off his hat with a flourish. 'Ave I the honour, sir, to address the owner of this lovely spot?' he asked in what he hoped was the true accent of a tripper.

The keeper stopped short and regarded him sternly. 'What are ye daein' here?' he demanded.

'Picking up a few pictures, sir. I inquired at your lodge, and was told that I might presume upon your indulgence. Pardon me if I 'ave presumed too far. If I 'ad known that the proprietor was at 'and I would have sought 'im out and addressed my 'umble request to 'imself.'

The keeper was thawing under this humility. 'Ye're makin' a mistake. I'm no' the laird. The laird's awa' about India. But Mr Bandicott—that's him that's the tenant—has given strict orders that naeboddy's to gang near the watter. I wonder Mactavish at the lodge hadna mair sense.'

'I fear the blame is mine,' said the agreeable tourist. 'I only asked leave to enter the grounds, but the beauty of the scenery attracted me to the river. Never 'ave I seen a more exquisite spot.' He waved his arm towards the pool.

'It's no' that bad. But ye maun awa' out o' this. Ye'd better gang by the back road, for fear they see ye frae the hoose.'

Leithen followed him obediently, after presenting him with a cigarette, which he managed to extract without taking his case from his pocket. It should have been a fog, he reflected, and not one of Archie's special Egyptians. As they walked he conversed volubly.

'What's the name of the river?' he asked. 'Is it the Strathlarrig?'

'No. It's the Larrig, and that bit you like sae weel is the "Minister's Pool." There's no a pool like it in Scotland.'

'I believe you. There is not,' was the enthusiastic reply.

'I mean for fish. Ye'll no ken muckle aboot fishin'!'

'I've done a bit of anglin' at 'ome. What do you catch here? Jack and perch?'

'Jack and perch?' cried the keeper scornfully. 'Saumon, man. Saumon up to thirty pounds wecht.'

'Oh, of course, salmon. That must be a glorious sport. But a friend of mine, who has seen it done, told me it wasn't 'ard. He said that even I could catch a salmon.'

'Mair like a saumon wad catch you. Now, you haud down the back road, and ye'll come out aside the lodge gate. And dinna you come here again. The orders is strict, and if auld Angus was to get a grip o' ye, I wadna say what wad happen. Guid day to ye, and dinna stop till ye're out o' the gates.'

Leithen did as he was bid, circumnavigated the house, struck a farm track, and in time reached the high-road. It was a very doleful tourist who trod the wayside heather past the Wood of Larrigmore. Never had he seen a finer stretch of water or one so impenetrably defended. No bluff or ingenuity would avail an illicit angler on that open greensward, with every keeper mobilised and on guard. He thought less now of the idiocy of the whole proceeding than of the folly of plunging in the dark upon just that piece of river. There were many streams where Jim Tarras's feat might be achieved, but he had chosen the one stretch in all Scotland where it was starkly impossible.

(Continued on page 70.)

MEMORY'S LANE.

DOWN memory's lane the phantoms are creeping,
The pale sad shadows glide out of the past;
The failures, and all the lost illusions,
The high hopes of Youth lying broken and dumb,
That boundless faith, and that high endeavour,
Midst the dead flowers of passion—
Down memory's lane.

And now pass the sweet and gracious ghosts
Of pleasures long gone by—
Of love, and life, and laughter,
Of music, dance, and song;
All lovely things, all pleasant things,
Are stealing down that lane.

And see the little timid ghosts
Of the kind things never said,
The pale little spectres of kindly deeds
That we meant to do—and never did!
Poor little wistful baby ghosts,
Fluttering sadly down memory's lane.

Now look at the phantoms of horrible things—
Youth gradually dying, the fires burning low,
All loathsome things, all cruel things;
For raptures and ecstasy, ashes and dust;
And down that lane of memory,
All down the dreary years,
Three hateful words stand out,
The signboard of despair!

I read these three, and nothing more—
The Editor regrets . . .

AGNES E. W. BROWN.

ROYALTIES I HAVE KNOWN.

By Madame CHAN TOON.

I.

WHEN the late Queen Victoria commanded my fiancé to present me to her privately, at Windsor, I was too young to realise that I was about to find myself in the presence of one of the most remarkable women of her time, or perhaps of any time. Her Majesty was not only great—she stimulated greatness in others; a most uncommon faculty! . . . We were received on arrival by a venerable servant in plain black with shoulder-knots, and conducted up the wide, shallow, scarlet-carpeted staircase, with its gold banisters and velvet hand-rail, to the famous 'royal red' corridor. Here we found the Queen. She came forward to greet us, took my hand in hers, and said in a voice, so near music as to be music, 'You must not be afraid of me; I am not really formidable.'

'I thank you, ma'am,' was my reply with a deep curtsy; 'but surely it is love and not fear that Your Majesty usually inspires.'

The Queen smiled. She appeared pleased. 'You uphold the reputation of your country,' she remarked, with a gracious inclination of her fine head. I am Irish by birth.

Then she turned her attention to my fiancé, warmly congratulating him on his recent unique successes at the Middle Temple. She apparently knew all the details, her every word showing how very much abreast of the day was Britain's ruler. The Queen finally announced that she was going to speak to the Secretary of State about the matter.

While Her Majesty was thus engaged, I had an opportunity to observe her. She was by no means so stout as various disloyal cameras had represented. She was dressed in the plainest black. Her narrow Honiton lace collar was fastened by a miniature of the Prince Consort, rimmed by a triple row of white, pink, and black pearls. On her wedding finger one splendid diamond, set in onyx, blazed a myriad fires.

Her complexion was that of a young woman, the eyes clear as bluebells, but her hair was scarcely less snowy than the quite immaculate cap that crowned it.

'Come,' invited the Queen; 'I will show you some of my treasures, and then we'll have a Highland tea.'

Her Majesty led the way; we followed. The corridor was of great length, lined with china cabinets and pictures, and, I thought, so far as grouping of colour went, singularly ill arranged. For instance, the Queen drew our attention to a magnificent tea-set of Rose Du Barry, valued at £150,000, enshrined behind panels on a stand of ruby plush—the combina-

tion was an artistic crime! General Gordon's Bible—presented by his sister—held a very conspicuous place on a high pedestal, protected by glass.

No fewer than five portraits of Disraeli adorned the walls—not one of Mr Gladstone; while several fine Landseers, hung with judgment, greatly pleased the eye.

At the extreme end, somewhat in shadow, stood a life-size statue of herself and the Prince Consort in gold; a most imposing but not beautiful piece of work.

Double doors opened through to the bridal suite of the Crown Prince and Princess of Germany, with hangings of white satin patterned with orange blossom. From there the Queen took us to the Indian room, a noble apartment overlooking the Long Walk. Here were gathered some of the many gorgeous gifts that India had laid at the feet of the Empress.

There was a golden globe of the world, on which emeralds were used for the sea and other precious stones of every variety for the countries. One felt that geography might, under certain circumstances, become interesting. A chair, shaped like a throne, made of ivory inlaid with jade, and encrusted with turquoise and sapphires, had been a present from Tippoo Sahib. There were countless scabbards and sword-hilts, glittering with gems, charms, and enamels, Persian rugs, embossed boxes and bowls, and a life-size peacock that spread a jewelled tail when touched.

From this dazzling spot we passed into the green drawing-room, in which furniture, curtains, and ornaments, even to the candles in the mighty chandeliers, were expressed in green, from the delicate shade of a lettuce leaf to the deep tone of two immense malachite vases placed in the windows, that had come from the Czar.

II.

Her Majesty pressed an unseen button, and the high mantelpiece rolled slowly back, revealing a secret staircase leading to the terrace, which she told us she often used on Mondays, being able thus to see her people without being seen.

From the green we went into the white drawing-room, an amazingly beautiful apartment, whose only touch of colour was some flowering rose-hued azaleas, and so, finally, to the scarlet drawing-room. This, the Queen told us, had been the favourite of George IV., but she herself favoured it little, because the man who designed and made the furniture had committed suicide in consequence of the Regent failing to pay him.

A peep at the dining-room, with its table made from a fallen oak tree and its great punch-bowl formed like a monstrous crawfish, a glimpse at St George's Hall, and then the Queen said, 'I hope you both have an appetite,' and turning the handle of a door, ushered us into a very lofty but small octagon chamber panelled with portraits of her four daughters-in-law, its mullioned windows commanding a superb vista of Windsor Great Park.

Here at a round table tea was laid—and what a tea! Eggs and bacon, cold chicken, caviare, boar's head, hot bread, scones, jams and cakes of every description, China and Indian tea, fruits, and liqueurs.

Here the Dean of Windsor joined us, a most elegant and courtly person, with a merry, kindly eye.

A delightful meal followed, free from any trace of formality. We waited on ourselves, and our hostess ate more heartily than any one I have ever seen, while listening attentively to various homely pieces of parish news as they fell from the lips of her clerical guest.

The conversation turned on music. 'I confess that I am no expert,' exclaimed the Queen, 'but I can differentiate between melody and organised noise.'

'Your Majesty's taste is unerring,' said the dean gravely.

The Queen glanced at him and smiled. 'I know of what you are thinking,' she observed.

'I can assure you I am not, ma'am,' he told her, and his eyes began to twinkle.

The Queen shook with silent merriment for a second or so. 'I give you leave to relate the incident; my young friends can be trusted.'

The dean bowed. 'I must tell you,' he began, 'that the other evening at dinner, Her Majesty was graciously pleased to admire a certain tune that was played, and sent to the bandmaster to inquire its name. The answer came back, borne by a poppy-coloured footman, trembling all over.

'If it please Your Majesty, the title is "Come where the Booze is Cheaper."'

'It is not a pretty name, but it is really a pretty tune,' said the Queen.

Tea concluded, we made our adieux. In the carriage below we found a portrait of our royal hostess and a basket of fruit and flowers.

III.

The prestige of the Prince of Wales (afterwards Edward VII.) was indescribable, not only in England but abroad; to be in 'the Marlborough House set' was to have reached a social apex beyond any other.

The Princess of Wales played her part with a delightful mingling of beauty, dignity, and grace.

The first time I met Their Royal Highnesses was at a breakfast given by James M'Neill

Whistler at his quaint old house in Chelsea. The famous painter himself was notorious for his unpunctuality when invited anywhere, while his excuse was always the same—a drunken cabman, a jaded horse, and an old woman who stood to be run over. On this occasion, when the prince and princess arrived, all the guests were assembled except Lady Violet Greville. We proceeded to the dining-room without waiting. It must have been quite a quarter of an hour later before her ladyship entered, when, with an apologetic curtsy to the royalties, she said: 'I am confident everyone will pardon me, when I say that I got Mr Whistler's cab.' The only person who failed to appreciate the joke was the host.

The next occasion on which I saw the Prince to speak to was when, some years later, he came behind the scenes of the Haymarket Theatre to congratulate the brilliant author of *An Ideal Husband*, who was a great friend of ours. To appreciate the point of the Prince's remark, it is necessary to recall that in the last act one of the characters announces his intention of going round the world, and asks his hostess what he shall bring her back.

'Anything,' is her reply, 'except, I beg of you, an Indian shawl.'

This greatly tickled the fancy of a Victorian audience. . . . When His Royal Highness entered the greenroom, he expressed himself as being delighted with the whole play.

'It is too long, sir,' said its creator. 'I shall have to cut it.'

'Pray don't, Mr Wilde,' cried the Prince. 'Take out nothing—not even about the Indian shawl.'

The Duke of Clarence, when out in Burmah, was our guest. He was a most melancholy young man, over whom there seemed to brood a heavy shadow—as the near future unhappily proved, it was the shadow of coming death. He appeared bereft of interest in anything.

Dinners, dances, races, native entertainments failed in turn to evoke enthusiasm. This distressed the merry Burmese people, who were vastly curious about this grandson of the 'great white queen,' while it seemed a reflection on us as hosts.

However, the young prince laughed once, and right heartily. He had given a suit of clothes to an old Burman who had waylaid him and begged as a souvenir for some garment that he had worn. On the morning of the Duke's departure this person appeared, and making his way proudly through the crowd of officials assembled on the wharf, prostrated himself before His Royal Highness, wearing the coat of the suit on his legs, the waistcoat buttoned round his head, and the trousers in the form of a huge neck-tie!

The Duke was still smiling as the ship dropped down the Irrawaddy.

HOW SERGEANT MILLEFEUX WON THE CROSS.

PART II.

VI.

NOW, who could have drugged the wine? And how did an Austrian general know all the details of my mission? How came he to repeat the very words of the Emperor about my being the most determined man in the French army?

And then I turned my eyes to where Lieutenant Dupré sat side by side with the Kaiserslicks. He did not look like a prisoner; he sat there smiling at me quite at his ease, and—Heaven, what was that? What was that he had on the breast of his coat? The white cockade of the Bourbons!

I leaped up. The leather band held me tight to the chair, but for an instant I lifted chair and everything, and stood up on my feet. Next moment the weight of the chair dragged me down with a crash, but I shook my fist at that smiling Hussar.

'Traitor!' I shouted. 'Traitor! Traitor!' But the rascal did not turn a hair. He sat there still smiling.

'Keep tranquil, sergeant,' said he; 'it's no use getting excited. Take my advice,' he continued; 'Napoleon has got to the end of his tether. Any reasonable man can see that. And besides, France is sick of him and his eternal wars. France needs peace, and demands peace. And only the Bourbons can give her peace.' And he waved his hand and shouted, '*Vive le Roi!*'

'*Vive l'Empereur!*' I shouted in reply.

Then the Austrian chimed in, 'Now, Sergeant Millefeux, it is no use for you to fight against the impossible. Where is your despatch?'

'Find it!' I shouted; 'if you can.'

'Your Excellency,' interrupted the rascally lieutenant, 'perhaps I can help you in this matter also. Look in the heel of the sergeant's right boot.'

At this fresh infamy I shook with rage. But it was no use. A soldier pulled off my boot, and the lieutenant himself touched the spring that opened the hollow heel, pulled out the despatch, and handed it to the Austrian general.

'Villain!' I yelled—'villain and traitor that you are! I shall see you shot yet!'

But they paid no heed to me, for the Austrian general had spread out the despatch, and was devouring it with trembling eagerness.

At last he looked up. 'This is news indeed,' he said to the others. And he began to read: 'To the Commandants at Metz, Thionville, Verdun, Mayence. The Emperor is about to receive large reinforcements from the army in Spain.'

'He intends to attack the Austrian army

under Schwarzenberg in a few days with his whole force.

'He will drive the enemy towards the Rhine, and he will pick up the garrisons of the fortresses as he advances, and add them to the active army.'

'Have everything ready so that your troops can join the army as soon as it appears.'

'NAPOLEON.'

There was a movement along the table as they all got up and crowded round to discuss the despatch. After a while they gave their orders, and I was carried off to a large building, and shoved into a room, with a couple of soldiers posted at the door to keep me safe.

And there I was left to my thoughts; and bitter thoughts they were. I had failed, failed utterly. The Cross that I had considered as already on my breast was gone for ever. And worse than that—the despatch was in the hands of the enemy; information which might mean the ruin of the Emperor and France was in their hands. And I, who was to have defended it with my life, had slept at my post.

And then I thought of the traitor who was responsible for it all; the villain who had drugged my wine, who had revealed where the despatch was hidden; the traitor who had deserted and given the enemy all the information, even to the most private words of the Emperor.

VII.

I remained in prison for three weeks, and then suddenly, one morning, I heard the boom of cannon, and some time afterwards the door of my room was flung open, and there stood that very Captain of Dragoons whom I had winged in a duel, and behind him was a crowd of his men.

At sight of me he uttered a shout of joy and, rushing into the room, shook me heartily by the hand. 'Come on, sergeant,' said he, 'we have found you at last. *Ma foi*, but you are a lucky dog. The Emperor is asking for you every day. The whole army has had orders to look for you. And we are to bring you along to the Emperor as soon as we find you. So come along, you old firebrand!'

'Ah,' I said, 'is it you, *mon capitaine*? And how is your arm?'

He gave a grimace. 'It is all right now,' he said, 'but you nearly kept me out of the fun with that d—d pistol of yours.'

I followed him out of the building. One of his men brought me a horse, and as I know how to ride, we were soon trotting along to the Emperor's headquarters.

The whole French army seemed to be marching past us. Columns of infantry, files of guns, and cavalry everywhere. This sight would have given me joy at any other time, but my misfortunes weighed too heavily on me that morning.

'Halloa, sergeant,' said the captain after a while, 'why are you looking so sad? Don't you know what has happened? But, of course, you won't, shut up in that hole all this time.'

'What has happened?' I asked.

'Why, Montmirail has happened,' he replied—'the glorious battle of Montmirail. We have just cut up Blücher's army into twenty thousand pieces, and here we are now chasing the Kaiser-licks like a flock of sheep.'

VIII.

Before long we entered the town of Troyes, and the captain brought me to the same old château, and ushered me into the very same room where Napoleon had given me that unlucky despatch.

In front of the fire stood the Emperor, nursing his coat-tails just as before, and at the table sat Marshal Berthier writing; and then my hands clenched suddenly, for there also sat the traitor, Lieutenant Dupré, smiling as if nothing had happened.

As I stood and saluted I could see that the Emperor was in very high spirits. 'Ah,' said he, 'you have come back at last then, Sergeant Millefeux. But you are certainly not so stout as when I saw you last. Well, you had better have another pinch of snuff.' And he offered me his snuff-box, as he had done on that evening three weeks before. But I did not take the snuff this time.

'Sire,' I said in a choked voice, 'I am not worthy. I have failed. But there,' and I pointed as I spoke to the smiling lieutenant, 'there, sire, is the cause of my failure.'

And with my voice swelling with indignation I shouted: 'He is a traitor, sire; sold to the Bourbons. He drugged my wine and betrayed me to the Austrians. And with his own hand he pulled the despatch out of its hiding-place, which the Austrians would never have found out for themselves. Arrest him, sire, and have him shot, and then I care not what happens to me.'

The Emperor took a pinch of snuff with great deliberation, and looked at me with a humorous air. 'Not so fast, sergeant, not so fast,' said he; 'you have made a mistake. Our young friend here is no traitor, but a good soldier of France. And as for your despatch, well, I meant it to fall into the hands of the Austrians. It was all a ruse.'

And as I stood bewildered and astonished he took hold of my ear, as his custom was with his old soldiers, and gave it a slight pull. 'Ah,

Millefeux,' said he, 'your Emperor has still a few tricks up his sleeve.'

'But, sire,' I stammered, 'I saw him myself among the Austrian generals, and he was wearing the white cockade.'

'All part of the plan, my friend,' replied the Emperor. 'Come, I will tell you the whole plan of campaign, and then you will be content.'

IX.

'You see, that old rascal Blücher was marching on Paris, and there was nobody to stop him. That was the trouble. I was glued down here at Troyes by the Austrians. If I moved against Blücher, Schwarzenberg would follow close on my heels. And I could not attack Schwarzenberg, for the army was still too weak in numbers. Those reinforcements from Spain—well, I put them in the despatch for the benefit of Monsieur Schwarzenberg. But as a fact I had not got them—they were still a long way off.'

'What was to be done? To be able to attack Blücher I must get two or three marches start of Schwarzenberg.'

'So I drew up a false despatch. I wanted that despatch to fall into Schwarzenberg's hands, but I did not want him to smell a rat; I wanted him to believe that it was a real message. That is why I sent you with it, for I knew I could rely upon your fighting to the death in its defence. And that is why I did not tell you that it was a false message, for I could not ask even you to sacrifice yourself for a despatch that you knew was only a ruse. As it was, if you had fallen in with the Austrians, I knew you would convince them that it was a true message by giving your life for it. Schwarzenberg would never have imagined that a man would go that length for a false despatch.'

'On the other hand, it was just possible that you might win through all right, and then Schwarzenberg would never have got the despatch, and you might have been waiting still in the Forest of Troyes for that imaginary agent. So Lieutenant Dupré offered to desert to the enemy and give them all the news, and he drugged your wine so that they might capture you and the despatch quite naturally, and yet without your needing to get yourself killed. Schwarzenberg never suspected for a moment, and when he read the despatch he did just what I wanted him to do.'

'He took up a strong defensive position and refused to budge from it. Why, he had his whole army digging trenches!'

And the Emperor laughed happily at the recollection.

'The false information,' he continued, 'kept poor Monsieur Schwarzenberg fast in his entrenchments, and so I got what I wanted—a start of two or three marches, before he tumbled to what I was really after.'

'Ah, Millefeux, it was Blücher I was after,

and before Schwarzenberg understood, I was away across the country, from the Seine to the Marne, with my whole army, and I caught old Blücher in his flank march and tore him to pieces.'

And the Emperor took up a piece of note-paper and tore it into bits.

'The old fox!' he exclaimed; 'he thought I was safely nailed down at Troyes, and that he had nothing to do but waddle along the open road to Paris. Well, he thought wrong, and his army has ceased to exist. We dropped him through the map at Montmirail.'

And the Emperor turned and let the torn pieces of paper drop into the fire.

'After I had settled Blücher,' he continued, 'I was joined by the reinforcements from Spain, and so here we are driving Schwarzenberg in his turn.'

The Emperor paused and took a pinch of snuff with great gusto. Then he beckoned to Lieutenant Dupré, who came forthwith and stood at my side. The Emperor drew himself up to his full height. 'Sergeant Millefeux,' he said, in a loud voice, 'and Lieutenant Dupré—you have helped me to save France, and I bestow on you both the Cross of the Legion of Honour.'

Then he pinned the Cross on my breast, and he did the same for the lieutenant.

'Now,' said the Emperor with a smile, 'the Traitor and the Man who Failed can go and drink my health together in another bottle of that famous wine. And, lieutenant,' he added, 'no tampering with *this* bottle.'

And that, my friends, is how I won the Cross.

THE END.

THE MONTH: SCIENCE AND ARTS.

AN UP-TO-DATE GAS-COOKER.

THE outstanding feature of a gas-cooker that has lately been placed on the market is an automatic heat-controller for the oven. All the cook has to do is to set the dial of this instrument to a given number, according to the degree of heat required, after which the oven can be left unattended, with the certainty that it will be maintained at the correct temperature. The cooker also possesses other good points which, although they do not constitute radical departures from standard practice, help to minimise the worries of the cook. The gas-rings, for instance, are of a new type, in which the orifices whence the flames issue are covered by an upper plate, and therefore cannot be choked by spilled foods. Moreover, the taps controlling these rings have three definite positions, of which the first is full on, the second gives a 'simmering' flame, while the third reduces the heat to the minimum required for prolonged stewing. Especial attention has been given to the design of the bars in the hotplate. These are so formed that the flames from the burners do not waste their heat by impinging upon them, and the gas is completely burnt, thus ensuring the maximum of heat with the minimum consumption of gas. The bars lift out separately for cleaning purposes, and cannot be replaced incorrectly. A very efficient grill is provided, with burners that can be turned upwards for boiling if extra heat is required. In the oven there is only one row of burners instead of two; the drip-tin, instead of resting on the floor, pushes in and out on guides at the bottom of the oven; and there are no loose shelf-supports, the grids being carried on runners which are embossed on the smooth enamelled sides of the oven, thus greatly facilitating cleaning. At

a convenient height above the hotplate a double plate-rack is provided, the bottom of which is made of wire-mesh, so that small vessels, spoons, &c., will not fall through. The rack may be folded back when not in use.

In a more expensive type of cooker the oven, instead of being situated below the hotplate, is placed alongside it, so that the bottom of the oven is at the same level as the hotplate, while the top ranges with the top of the plate-rack. All stooping when dishes are lifted in or out is thus obviated. Immediately below the oven, but still at a considerable height above the ground, is a chamber provided with a separate burner, in which foods may be warmed up or kept warm.

A HUGE POST-OFFICE WIRELESS STATION.

Some idea of the size of the wireless station being erected by the post-office near Rugby will be gathered from the fact that the site covers 900 acres. The aerial, which may be used in one length or in two sections, is supported on no fewer than twelve masts, each of which rises to a height of 820 feet. From the layman's point of view these masts are the most interesting feature of the station. They are triangular lattice-work steel structures, measuring 10 feet across each face, and they are placed 1320 feet apart. No attempt is made to keep them upright by sinking them into the ground; in fact, the heel of each is fitted with a socket which rests upon a sphere, for the express purpose of allowing movement. The masts are held vertical by wire-rope stays in five sets of three each, one set being attached to the top, while the other four are fastened at intermediate points. These stays are anchored to massive blocks of concrete sunk into the ground at distances out from the mast of 200, 400, and 600 feet respectively, and

each stay is insulated from the ground by porcelain insulators so arranged that the pull serves to compress them instead of tending to tear them apart. The mast itself is also insulated at the heel by twelve porcelain insulators, under which is a granite block, 5 feet 6 inches deep, whereby the metal work of the mast is further insulated from that connected with the ground. Under this granite block is a wrought-steel pillar, which rests upon a big block of concrete reinforced with steel girders. Up each mast there is a lift which is capable of carrying three men and their tools. A steel ladder is also provided in case the lift should fail. The aerial between each two masts consists of eight wires in the form of an octagonal cage, measuring 12 feet across. The aerial is supported on a steel wire-rope, the end of which is run down each mast. At the bottom it is wound upon a winch which can be worked by hand or power, and which has a slipping device that limits the tension to 10 tons. A very large amount of power is required for transmitting from this station to India, Australia, and other distant parts of the world, the current available being equivalent to well over 2000 horse-power, although only about 800 horse-power will be used at one time.

It will come as a surprise to some of our readers that the valves with which they are familiar in listening-in sets are also used for transmission, but in this case they are so large that water has to be circulated round them to keep them cool. Fifty-four valves are employed, and the wave-length adopted is 18,000 metres. Current is obtained from the Leicestershire and Warwickshire Power Co., and converted into a suitable form for transmission by machines which have been built by The British Thomson-Houston Co. of Rugby. Illustrations and further particulars of this interesting wireless station will be found in *The Engineer*.

SAFE STARTING FOR CARS.

Backfires still occasionally take place when cars are started, with damage to the wrists of the operators. In motors with more than one cylinder this risk is entirely overcome by a device which short-circuits the ignition when the starting handle is being pushed down. It consists of a semicircular steel disc on the starting handle shaft and an insulated spring contact fitted to the chassis where the disc will rub against it while the handle is being pushed down. The spring contact is connected to the earth terminal on the dashboard or the magneto. When the handle has passed the bottom of its travel and is beginning to come up the disc leaves the contact and sparking can take place. It will be noted that the device does not actually prevent backfires, but it ensures that they can only occur when the

starting handle is being pulled up, when it merely slips out of the hand. This invention is very easily fixed to any car or lorry.

A CHAIR WITH MANY COMBINATIONS.

During the last few years much ingenuity has been expended in devising articles of furniture which can be used for several purposes. A recent addition to the list is what looks at first sight to be an ordinary arm-chair of the type which has a vertical, oak bar frame, with rectangular cushions for the seat and the back. A more careful scrutiny reveals a double set of bars at the sides and the back, while certain loose parts are supplied separately. The result is that this chair can be transformed in a few minutes into many other articles of furniture. It is a simple operation to provide the chair with either a side or a front table. An extra cushion with an extension piece produces a lounge chair with a leg rest. The same extension, with the extra cushion and the false sides opened out, forms the chair into a bed. A child's cot, with or without a canopy or a table, is easily constructed. Other possibilities are an occasional table and a dining-table. Both the frames and the cushions are of good quality and are well finished, the cushions being covered and stuffed with various materials to suit the requirements of customers. Another device on similar lines is one which can be converted from a comfortable settee to an equally comfortable double bed (and vice versa) in a very few minutes.

AN OIL-ENGINED LOCOMOTIVE FOR RUSSIA.

In an article in our issue for May 1924, 'The Locomotive of the Future,' it was suggested that the oil-engined locomotive was the coming type for the main lines of this country. To provide the enormous power required, what is known as the Diesel engine is the only one available. The chief difficulty is the starting of a heavy train, which takes several minutes. As stated in the article referred to, this has always been possible by using the engine to generate electricity for actuating powerful electric motors on the driving axles. An oil-engined locomotive working on this principle has lately been built at Stuttgart, in Germany, for Russia, where not only will the advantages over steam locomotives for this country be realised, but also the saving due to the low price of oil compared with that of coal. The weight of this locomotive with fuel and water on board is, according to *The Engineer*, 125 tons. With its six cylinders the engine develops 1200 horse-power when running at 450 revolutions a minute. It is coupled to a dynamo which supplies current to five geared, electric motors on as many axles, the driving wheels being 4 feet in diameter. The speed is about 30 miles an hour, and the locomotive is said to pull with a force of 15 tons.

Although the electric system overcomes the starting difficulty, the cost is so great that every effort will be made to find a less complicated solution. The friction clutch would become red-hot under the conditions, but a form of hydraulic clutch which is proving successful for big ships should be equally effective for locomotives. Then we have the Still oil engines, as described in the article previously referred to, which will start a heavy train on steam.

NO MORE STAINED HANDS.

In these days, when almost every one possesses a motor car or a motor bike, a large proportion of men and many women can and do keep their own motor vehicles in order. This entails dirtying the hands with a mixture of road dust and oil which shows for days, in spite of repeated washing. A substance is now available which, if smeared over the hands before a dirty job is undertaken, completely protects them. This substance looks like tooth paste, and it is sold in similar lead tubes. A length of about $\frac{3}{4}$ inch is squeezed out and rubbed well into the hands. After this has been done any kind of grease or even tar can be removed entirely by washing with ordinary soap and cold water. This protective cream is harmless to the most sensitive skin; in fact, it has antiseptic qualities, and is being increasingly used by ladies who do their own housework.

A NEW FORM OF OIL STOVE.

The number of oil stoves that have been placed on the market during the last few years is legion. Some are simply a source of trouble. The best known to us have been described in these columns from time to time. A type which has become very popular in Denmark, where it is manufactured, has lately been introduced into this country. In its simplest form it consists of a rectangular japanned steel box, in the middle of which is the burner. The lower part of the burner is a narrow trough in the form of a ring, in which is a circle of asbestos. A device in connection with the supply of paraffin from a reservoir maintains the liquid in the burner at a depth of $\frac{1}{8}$ th of an inch, or just enough to ensure a good supply for the asbestos ring. A series of concentric, perforated cylinders of thin sheet steel above the asbestos vaporise the paraffin and add the correct proportion of air, the result being an absolutely blue flame which gives off intense heat. The reservoir holds half a gallon, enough to feed the burner continuously for 15 hours. It is cylindrical in form, and is fixed outside the stove, where it is free from any risk of becoming heated. A spring valve in the bottom is pushed open so long as the reservoir remains in position, but closes when it is removed for the purpose of being filled, the oil in the bottom of the burner maintaining the flame during

this operation. The oil is shut off from the burner by a screw-down valve when the stove is to be extinguished. This stove is very powerful, the heat given off being equal to the average gas-ring when turned full on. The asbestos ring does not burn away; consequently the stove remains perfectly clean and requires no trimming. Moreover, one ring will give months of service, and when a new one is required, it can be fitted easily and quickly. As there is no pressure, the stove is perfectly silent. Safety is assured by the position of the reservoir, and by the necessity for its removal for filling. This stove is made with a single burner, or with two burners fed from one reservoir. An oven is provided if required.

AN EFFICIENT STEAMER AND BOILER.

We have recently had the opportunity of testing thoroughly the merits of a new and economical cooking utensil which has just been put on the market, and which has given eminently satisfactory results. It consists in essence of an aluminium saucepan, into the upper part of which fits a steamer made of the same material, so that, while one kind of food, say carrots or turnips, is being prepared in the lower part of the device, some other kind, say a stew, fish, or a pudding, may be being cooked in the upper part. The steamer is excellent, too, for the preparation of well-cooked porridge. The device is manufactured in two somewhat different forms and sizes. In one the saucepan has a diameter of 8 inches and a depth of 6, and is fitted with a strong tubular handle of the ordinary kind on one side, and a lifting handle of roughly semicircular shape on the other. The covered pannikin or steamer for use with this saucepan is $7\frac{1}{2}$ inches in diameter and 3 inches deep. In the second type the saucepan is 7 inches in diameter, has a depth of 6 inches, and has only one handle—of the straight, tubular kind. The corresponding steamer is $6\frac{1}{2}$ inches in diameter and 3 inches deep. A distinctively novel and useful feature of this device is that in both types the cover is fastened so securely to the body of the steamer that the steamer is lifted out by means of the cover. In this way the steamer and its contents are readily removed without the slightest interference with the contents of the saucepan. The lid, which is made to fit both steamer and saucepan, is easily detached from the steamer part for service on the saucepan when the other portion is not in use. The steamers, it may be added, may be bought separately, and are adapted for use with any saucepans of suitable diameter.

THE POSSIBLE DOOM OF HAYMAKING.

We are all familiar with the process of hay-making, which may be described as turning over the hay after it has been cut, so that the sun and the wind may dry it. If hay is

stacked before it is dry it will ferment and go mouldy, with the result that it becomes useless as a food for horses and cattle. It is even more important that crops of corn should be well dried before they are carted and stacked. Unfortunately, the weather is often so unsettled in this country as to render the drying process very difficult. In very wet seasons the mown crops have even been left to rot in the fields because they never became dry enough to stack. Artificial drying has been tried from time to time with varying results, but hitherto the high cost has always put such methods 'out of court.' Forcing air through stacks was tested by the Ministry of Agriculture in 1923, but drying in this way took so long that fermentation took place, mould frequently developed, and the cost was very high. This process, however, naturally led up to the use of hot air, a development which has been recently investigated by the Institute of Agricultural Engineering of Oxford University, of which Captain B. J. Owen is the director. According to a preliminary report issued a short time ago, this method of drying crops costs less than exposing them to the action of the sun and wind, and this in spite of the fuel and the labour required. To distribute the hot air evenly through it the stack is built round and over a central chamber, shaped like an upright cone. This central chamber consists of a strong wooden frame, covered with wire netting, through which the air passes freely. The form of the chamber varies for different crops, and the size is approximately $\frac{1}{10}$ that of the stack. A pipe from this chamber comes out on one side of the stack, where it is connected to the hot air supply. The most convenient source of heat has been found to be a series of pressure paraffin burners similar to those used in wickless stoves. The air is drawn over the heating elements and forced through the stack by a centrifugal fan, which is driven by a paraffin or electric motor. Grass when cut contains about 75 per cent. of moisture, of which anything up to 25 per cent. will dry out if the grass is left in the field (without being 'made') for twenty-four hours. When the weather is fine, this plan shortens the artificial drying operation, and it costs nothing. After the stack, which is circular, has been built, the heating and blowing apparatus is set to work, and the hot air blast is maintained for about eight hours. Corn may be carted immediately after cutting, but if mixed with an excessive amount of green matter it may with advantage be left in the field for a day. When comparing the respective costs of artificial drying and the natural process it must be remembered that the latter involves a good deal of labour. Actual figures for both methods were collected during last season and reduced to a tonnage basis. In a good season the cutting, carting, stacking, and drying of hay came to 11s. 6d. per ton for the artificial method, against

13s. 6d. for the natural process assisted by 'making.' The cost for cutting was, of course, the same in each case; carting and stacking were charged 1s. more for the artificial drying system, owing to the extra weight of the damp crops. It was in the drying that the saving was effected, the artificial plan costing only 1s. 6d., whereas 'making' cost 4s. 6d. In a wet season 'making' is estimated to cost double this amount. There is strong evidence, also, of improved value for both hay and corn crops due to the artificial drying, compared with that effected by sun and wind in the fields.

AN EXPANDING TABLE WITHOUT LOOSE LEAVES.

An expanding dining-table, which has been recently brought out, in which the extra leaves are housed within the table itself when they are out of use, seems likely to oust the extensible type that has loose leaves for insertion in the middle or at the ends. In operation the new table is exceedingly simple. It is only necessary to raise slightly, and then to pull out, first one end and then the other. Pulling out the old-fashioned dining-table is a two-handed job, whereas a very light pull extends the new type. There is a fixed bar or very narrow leaf at the middle of the table. As each end reaches its full extent an extra leaf rises into position between this bar and the table end. Neither fixing nor tool is required. Each end of the table can be extended in a few seconds, if not by a child, at least by the smallest of women. The leaves do not slide on each other, but on runners; hence there is no scratching of polished surfaces. An advantage of the system is that, as the extra leaves do not come on at the ends, as with some extensible tables, the ends can have rounded corners or oval ends. These tables are made in many styles, of various woods, and finished in different ways. Every variety is stocked by the makers in more than one size.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

*. TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

PETER WAS SINGLE.

By J. FREDERICK TILSLEY, Author of *Cheerio*, &c.

PART I.

I.

'THANKS,' said Peter Golding.

He gave the lift-attendant a friendly nod, stepped briskly from the lift, and crossed the passage to a frosted-glass window which bore the one word 'Enquiry' in bold black letters.

'Of course,' thought Peter, 'I sha'n't get it—no such luck. Still, things might be worse—it's not as if I were married.' Thousands of young men were consoling themselves with the same reflection at precisely the same moment. Peter raised his hand and rapped quite briskly upon the frosted-glass window. The next moment he found himself looking into the eyes of a young girl. She was a very pretty girl, and Peter, although shy, gave her his best smile; he rather liked pretty girls! 'I came in answer to this,' he explained. Diving a wet hand into the breast-pocket of his sodden and steaming raincoat, he drew forth tenderly a sheet of folded paper. 'Rather late, aren't I?'

The girl accepted the letter and glanced briefly through it, her head moving gently from side to side as she skimmed over the type-written lines. She was about to turn to Peter again when some detail of the letter caught and held her attention. She started, and raised very wide eyes to his face. 'It says two-thirty,' she said in a low, startled voice. 'My word, you are late!'

Peter reddened, and felt for his watch; then he remembered that he had not possessed a watch for some time, and his colour deepened. 'Yes—I—er—missed the train, you know.'

The girl glanced over her shoulder, evidently consulting a clock, which was invisible from Peter's side of the window. 'It's turned three,' she informed him, and her words were accompanied by a glance which seemed to say, 'My poor young man, you'll have to brighten your ideas up if you are going to work here.'

Peter looked relieved. 'Good,' he said cheerfully; 'I thought it would be later than that.'

The girl laughed, as though this young man was something new in her experience. 'If you will please wait in the office at the end of this

passage, I will tell Mr Reginald you are here—yes, to your right.'

Peter raised his wet hat and turned to the right. A few steps brought him to the office indicated, and he tapped on the door, which was slightly open. Receiving no answer, he entered without further ceremony. The room was small but eminently business-like. The furniture consisted of a solid little table and two chairs. On the table were a telephone and the current numbers of several trade journals. Hanging above the table, within easy reach, were a telephone directory and a railway guide. Above these was the terse command, 'No smoking.' The space above the fireplace was completely covered by a map of the British Isles, coloured in a way that was new to him. Opposite this, and almost as large, was a framed advertisement of men's underwear.

'Seems to be a jolly big firm,' said Peter, speaking aloud. 'There must be hundreds work here. Wonder who on earth Mr Reginald is? Ah, of course, my letter was signed "R. E. Clawson." Naturally I sha'n't get the job—just my luck to be late. . . . Still, I'm not married, and that's something to be thankful for.' He sighed.

II.

Peter, born dreamer that he was, permitted his mind to wander back to a trivial incident which had happened only a few minutes previously. On his way up the flight of broad stone steps at the imposing entrance of Messrs Clawson's great warehouse Peter had come face to face with a girl who was coming down. She was a tall girl, with bright eyes and an unusually high colour. She had paused for a moment in order to unfold her umbrella. Peter had never seen a human face which expressed so much character and so much gentle dignity. There was another quality in that strange, beautiful face, some indefinable quality for which Peter could find no word, and Peter was rather good at describing things. It was a quality that seemed to be made of almost equal parts of quiet gaiety and a great sadness, a bravely smiling fatalism.

'I wonder what she was doing here?' thought Peter; 'I wonder if I shall ever see her again?'

There was a quick step outside, the door of the office was flung open suddenly, but without violence, and Peter found himself face to face with Mr Reginald.

Mr Reginald was a short, heavily-built man of something under fifty. He had cold, blue eyes and a mouth like a trap; he glared at Peter for a moment, and then closed the door much as one might close the door of a cell. 'You are late,' he said, in a tone which seemed to jar Peter's backbone.

'Ye-es,' answered Peter. 'I—I'm sorry—I missed my train.'

Mr Reginald tugged savagely at one spike of the iron-gray moustache which decorated his upper lip. 'Why did you miss your train? And do you usually miss your trains? These things are important, Mr Golding.'

'To be quite frank with you,' answered the startled Peter, 'I could not afford to travel by train, so I—I walked.' Blushing deeply, he thrust out one of his muddy boots for Mr Reginald's inspection. 'I've never done the walk before, and rather misjudged the time it would take—must be over six miles—and it rained all the way.'

'Seven and a half,' snapped Mr Reginald; 'you ought to have known that. I knew it, and I've never been in the place in my life. Better make a note of it—seven and a half, wet or fine. How long have you been out of work?'

'Well, you see, I have always been with my father.'

'What was your father?'

'An artist.'

'Oh!'

Mr Reginald uttered that 'Oh!' in much the same tone that he would have used to say 'guilty.'

'Father died two years ago, and I have been seeking some sort of a position ever since.'

'In that case I ought to have heard from you before this,' declared Mr Reginald. 'You can't be very enterprising, or you would have been here before now.' His voice rose suddenly. 'How is it I haven't heard from you before now? Where have you been?'

Peter grew pale. 'Well, I answered your advertisement the moment—'

'That particular one, yes—but what about the others? Wait!' Mr Reginald flung himself from the office, leaving the door wide open behind him.

'Phew! What a nice man,' murmured Peter in a shaky voice. 'Thank the Lord I'm single.' He gazed longingly at the door, half rose, and then fell back into his chair with a regretful sigh. He had heard of these sledge-hammer business men, and during periods of affluence had seen them on the stage and at the cinema;

but this was the first he had ever met in the flesh. Peter decided that he preferred his Napoleons of Commerce on the screen.

Mr Reginald appeared again with an expression of triumph on his face and two long slips of paper fluttering from his fingers. 'Those,' he announced in a tone which matched his expression, 'are the advertisements you did not answer. The wording is exactly the same in each case; they appeared in the same newspapers, and they concern the same job.'

Peter tried to count the advertisements pasted on the long slips, and decided there must be more than a dozen altogether. 'Some job, evidently,' he reflected with a sinking heart. '—Well, Mr Clawson,' he said aloud, 'it's like this: I've never been in a warehouse in my life—I told you that in my original application. It was only when I received no answers to my applications for positions I knew something about that I decided I might as well waste ink and paper on the others.'

Mr Reginald nodded thoughtfully. 'You write a very passable letter,' he admitted grudgingly, 'and good letter-writing is essential to the job. Are you married?'

'No, Mr Clawson; single.'

'Good. Drink?'

'Not intoxicants, anyhow.'

'Good. Smoke?'

'A little, Mr Clawson.'

'Pipe?'

'Cigarettes.'

Mr Reginald frowned. 'Instant dismissal for any one found smoking anything anywhere on these premises at any time. Now listen; I'm looking for an assistant-manager who isn't afraid to remove his jacket and work.' Head-managers, you know, are only human; they are subject to the same infirmities as other people; they fall sick occasionally, and when that happens it is necessary to have some one who is capable of slipping into their shoes and carrying on. For some reason or other we cannot find a suitable man for the hosiery department. The man who is there now is good in some ways, but he is not good enough; only the best is good enough for me. The man who takes this job on must have no doubts about himself, or he is lost. He has a lot of girls to deal with, and girls are queer creatures.'

'I'm not very self-confident,' admitted Peter.

'Then you are no use to us,' declared Mr Reginald decisively.

'Of course, I might cultivate it after a time,' suggested Peter hopefully.

'It would not have to be a long time,' answered the other, frowning heavily at the telephone. 'I don't quite know why, Golding, but I'm disposed to let you have a try at it.' He rose to his feet suddenly. 'Come on Monday—eight twenty-five—everybody here is at work by half-past. If you make good, we

shall be pleased to keep you. If you don't, you go in one month's time—no further notice required. Good-day, Golding!

III.

Peter Golding, unsuccessful artist and unsuccessful other things which have no direct connection with the present history, arrived at Messrs Clawson's huge (and, in its way, impressive) warehouse promptly at eight-fifteen the following Monday morning. The lift-attendant, now wearing a greasy suit of overalls in place of his smart uniform, was polishing the imposing brass name-plate on the side of the entrance. He eyed Peter compassionately, and greeted him politely. 'Mornin.' Comin' to work 'ere?'

Peter answered the greeting, and said that he was there for the purpose of starting work.

The other smiled sadly. 'They come and they go,' he observed cryptically. 'Taking Mr Sadler's place, I expect. I 'eard 'e was goin'. Very nice young feller, too—same style as yourself—in 'is ways, I mean.'

'He—he is still here, then, this Mr Sadler?' inquired Peter, suddenly feeling very uncomfortable.

'Oh yes; doesn't finish till the end of this week—very nice young feller.'

'What sort of a place is this?—I mean to work for?' asked Peter.

The lift-attendant became cautious immediately. 'Well, my work doesn't take me inside much, but, of course, I 'ear things; but you can't believe everything you 'ear, can you?'

Peter admitted the truth of this.

'It wouldn't be so bad if it wasn't for Mr Reginald,' went on the lift-attendant, forgetting for the moment to be cautious; 'an' they do say that Mr Reginald wouldn't be so bad if it wasn't for 'is wife. She's one of the lively sort—fond of going about an' what not. If she 'ad to work 'ere she wouldn't have much life left in 'er at the end of the day.'

'It's not much of a place, then, eh?'

'There might be worse places in the town, but I never 'eard of 'em, an' I don't know where they are. It's that there Mr Reginald—my word, 'e's a 'ot un. Mr Reginald— Look out, 'ere's old Hughes!' The lift-attendant turned his back on Peter and resumed his polishing with redoubled vigour.

Advancing towards them from the opposite side of the street was a short, middle-aged gentleman in a light overcoat and spats. He walked with jerky, nervous strides, and continually glanced over his shoulder in the apprehensive manner of one who is in continual dread of being overtaken by some imminent and unpleasant fate. Peter was soon to learn that Mr Hughes, never a very strong character at any time, had been systematically reduced to a mass of nerves by the continual bullying and

grumbling of Mr Reginald, and Peter was soon to experience the methods which had made the manager of the hosiery department something considerably less than a man.

'This young feller's waitin' to see you, Mr Hughes,' said the lift-attendant as the manager approached them. 'Come to take Mr Sadler's place, I believe.'

'Oh—er!' jerked the manager nervously. 'Well, look here,' he continued, watching Peter's boots intently, 'nobody below managers is permitted to use the front entrance. Only managers and THE FIRM use the front entrance; the workpeople go round to the back.'

Peter nodded. 'I'm sorry; I didn't know.'

Mr Hughes raised his eyes from Peter's boots to the top button of his overcoat. 'Better come this way now.' He turned to the lift-attendant suddenly. 'Take him up, and tell some one to show him to the hosiery department.'

IV.

A polite but worried-looking warehouseman led Peter up three flights of stairs, and then saying, 'Here we are,' disappeared.

Peter was in the hosiery department, the scene of his future activities. For as far as his eyes could reach in either direction stretched an interminable length of huge stock fixtures. Along the windowless wall was a long row of tables, which, although dwarfed into insignificance by the great fixtures, were really of quite a workman-like size. On each table was a wooden box containing a ball of string, a pair of heavy scissors, a large tin receptacle for pins, several piles of stock letters printed in imitation type under Messrs Clawson's well-known and business-like heading, a tape measure, and on most of the tables a neat pile of hosiery, covered with sheets of tissue paper. Hard and continual work had polished the table-tops to a smooth glossiness. There was something hard and polished and unfeeling about the whole place, thought Peter, with a sinking at the stomach; even the roof was made of glass, and the floor so hard and unyielding that it rang under the feet. Peter now observed that a young man of about his own age was approaching him, a serious-looking young man who wore glasses. He had appeared quite suddenly from behind one of the fixtures.

'Good morning,' he greeted pleasantly. 'I suppose you are the chap that's coming to take my place. Well, don't let it worry you in any way—you'll have quite enough to worry about without that. However, I don't finish till the week-end, and I shall be only too glad to help you all I can—my name's Sadler, you know.'

Peter breathed a sigh of relief. This inevitable meeting with Mr Sadler had haunted him like a nightmare since his talk with the lift-attendant. It was, he had felt, a meeting which

was bound to be unpleasant for every one concerned. Peter hated to think that he was stepping into another man's shoes. 'Have you got anywhere else to go to?' he asked awkwardly.

'Oh, rather—going back to my old firm. This is a vile hole, but the training you get makes you a valuable man in any warehouse. Now, we mustn't be seen standing about or we'll be snatched over the coals. Come and have a look round, and I'll give you some idea of what goes on in this place. Have you been in a home-trade house?'

'This is the first warehouse I've ever been in,' admitted Peter, flushing a little.

Young Mr Sadler made a compassionate noise in his throat. 'You are starting well, I must say. Now, the position is something like this: you have under you a jolly decent hard-working staff, even if they are girls. Well, your job is to keep 'em at it. Girls are queer, you know; they work like slaves for weeks, an' then something sort of comes over 'em—they remember they are human beings, and there's no doing

any good with 'em till the fit wears off. They come late, and make mistakes, and their tempers get uncertain. Well, you've got to keep 'em in order. If you can increase the output, well and good; but if the opposite happens, Heaven help you! To be perfectly frank, there are times when you'll have to bully 'em.'

Peter said 'Oh!' in a startled voice.

'Another part of your work will be looking after the stock, which requires constant supervision. All the girls under you are employed in getting orders out, and they work at terrific speed, executing the orders and sending them down to the packing room, complete with all necessary correspondence. Your business is to see that fresh stock is placed in the fixtures as rapidly as the old diminishes. You also have to attend to all complaints and all inquiries—that's the reason good letter-writing is so important. You will find Miss Slade invaluable. Ah, here's the staff arriving; it must be close on half-past—come along and I'll introduce you.'

(Continued on page 88.)

MEASURING GENIUS.

By WILLIAM DOUGLAS.

THE world in general is content to regard genius as a phenomenon that appears at rare intervals in defiance of, rather than in accordance with, natural laws. The fact of genius, its choice of the medium in which it expresses itself, and the form of that expression, are unquestioningly accepted as inevitable and inexplicable. The reading public, while it is eager to be amused or interested or thrilled, will not readily consent to think. So it prefers to look upon genius as something altogether miraculous, and loves such fine phrases as Wordsworth's 'light that never was on sea or land' and Carlyle's 'inspired gift of God.'

Most people are strangely gratified when there is striking contrast between the circumstances of genius and its performance. The greater the contrast, the greater the miracle. If a ploughman turn poet or a policeman paint pictures, the world applauds the prodigy. It would be disappointed if Bacon proved to be Shakespeare. This trick of contrasting opposites is as old as history. David of Israel and Jack the Giant Killer are heroes because they were, comparatively speaking, pygmies. Diogenes steps from his tub into the temple of fame. The average man is particularly delighted when the personality or history of a poet seems out of keeping with his poetry. He thinks of Chatterton as the 'marvellous boy' who starved in a garret. Marlowe is the tavern brawler who is killed in a drunken scuffle over a prostitute—by Will Shakespeare

himself, if we are to believe Miss Clemence Dane, who certainly knows better. Milton writes *Paradise Lost* and Homer *The Iliad*, each after he is blind. Dr Johnson is scrupulous, gluttonous, and a boor. Goldsmith is the 'inspired fool' who 'wrote like an angel but talked like poor Poll.' Shelley is an atheist, and Byron a blackguard.

Yet it is obvious that Shakespeare would have been no less a genius if he had been Lord Chancellor of England. Homer and Milton would not have written worse poetry even if they had had Argus's hundred eyes. Shelley, although he had turned Quaker, would still have 'dabbled his fingers in the day-fall, and littered the floor of heaven with his broken fancies.' Were Mr Chesterton thin as an eel and Mr Bernard Shaw gargantuan, their charm would be no less potent. The man in the street cannot be made to think so. Believing that the marvellous essential is rendered more marvellous by contrasting concomitant inessentials, he measures the first by its distance from the second—as if genius were not something above and beyond such accidentals; and he is encouraged in this false correlation of opposites by literary biographers, whose opinions he swallows as trustfully as he swallows innumerable patent medicines, their effects savouring of the miraculous because he is ignorant of the ingredients.

But he has other methods of judging genius. While he enjoys best what is simple and easily intelligible—the tritely true, the strongly

emotional, the obviously clever, and the broadly humorous, yet he distrusts his preference because he suspects simplicity. Thus for long he gave Wordsworth and 'Mark Rutherford' scanty recognition, and his opinion of Carlyle and Browning, after their insistence secured his attention, is not less because they are often unintelligible to him. The soaring imagination of Shelley and Francis Thompson, and the subtle psychology of Joseph Conrad, win admiration from some, at least, who hope to gain a reputation for a discernment to which they have small claim. With those who confuse artifice and art, the 'apparent profundity which is only lack of transparency' obtains credit for the very qualities that are wanting; and clever people like Mr Chesterton and Mr Bernard Shaw delight in exploiting such weakness by counterfeiting oracularness, and by deliberately pretending to be subtle and elusive.

Simplicity of subject and expression is so often regarded as a mark of mediocrity that the worth of a work is frequently measured in inverse proportion to its simplicity. Horace Walpole, who deemed himself no mean judge of literature, was disgusted, on the first night of *She Stoops to Conquer*, at the 'lowness' of the dialogue, and condemned the subject as common, the execution as commonplace, and the whole play as 'the lowest of all farces.' And there are still people who prefer Dr Johnson's little fishes that talked like whales to Dr Goldsmith's, which spoke in *propria persona*. It is not only Lord Morley's Nationalists who cannot 'realise that a big word is not the same as a big thing.'

The man of the world sometimes judges genius, particularly poetic genius, by comparing its mentality with his own, flattering himself considerably in the process. By this method of calculation, genius is measured in inverse ratio to its sanity. The man of the world does not make the comparison in respect of originality, inventive power, imagination, perception, receptivity, spiritual energy and enthusiasm; that were too exhausting a method—and the result might not be so flattering to his self-esteem. The standard of his measurement is common-sense, and he fondly misapplies Dryden's famous couplet:

Great wits are sure to madness near allied,
And thin partitions do their bounds divide.

So he regards genius as a kind of mental disease, and credits the weaknesses of the long-haired types, familiar in caricatures, to poets like Chaucer, Spenser, Shakespeare, Milton, and Wordsworth.

As a matter of fact, these, the greatest masters of English poetry, are characterised by a practical sanity and commonsense that the man of the world might envy. Chaucer wrote his *Canterbury Tales* in the intervals of making out bills of lading and of attending to his duties as

ambassador, master of works, and member of parliament for Kent. Spenser was planning his *Faerie Queene* while he was secretary to the deputy-governor of Ireland. Shakespeare, successful actor-manager and merchant, was suing a certain Mr Philip Rogers of Stratford for the sum of thirty-five shillings and tenpence about the time he was writing *Macbeth*. It was while Milton was, prosaically enough, earning his living as a schoolmaster that he wrote his *Areopagitica*, 'the majestic classic of spiritual and intellectual freedom, with its outbursts of shattering vituperation, its inflammatory scorn, its boundless power, and overflow of passionate speech in all its keys of passion.' Wordsworth was so strong in reasoning power, so restrained in imagination, and so eminently practical in his theory of poetry that the reproach in his case, also, is wholly unjustifiable.

But Dryden is not alone among great writers in libelling genius. Macaulay, to take one instance more, elaborates the charge, and is himself guilty of another 'vulgar error' in quoting, as if it were Shakespeare's own view, the opinion of Duke Theseus in *A Midsummer Night's Dream* regarding the 'fine frenzy' of the poet:

How many cite Polonius to their sons
And call it Shakespeare!

Macaulay's *Essay on Milton* has all the enthusiasm of youth and all its courage and assurance. It is a masterpiece of detailed knowledge and clever rhetoric. Its generalisations are, however, often faulty. 'Perhaps,' he says, 'no person can be a poet or even enjoy poetry without a certain unsoundness of mind.' But this bold assumption leads only to the very mild conclusion that a child-like imagination is a necessary quality in an imaginative poet—an obvious platitude that none will deny.

No doubt there have been mad poets as there have been mad hatters. Some great men, like many little men, have been guilty of poverty, blindness, corpulence, smallpox, and self-indulgence and excess. A poet, however, is great not because of these things but in spite of them. Cowper was sometimes mad, but he was strikingly sane in his writings. Burns was no moral Hercules, but he is a giant in lyrical verse. Poe and Francis Thompson may have been weak enough to sink into the depths of indulgence, but they have the power that scales Olympus. And the world owes more to two such souls than it owes to a thousand others whose sanity and common-sense are the best they can boast of.

Some people would measure genius as they measure the efficiency of machinery, by ease and rapidity of production. They labour under the illusion that poets produce their masterpieces without effort. They love to read of poets who never blotted a line, who lisped in numbers for the numbers came. To such people he is no heaven-born poet who scorns delights

and lives laborious days, whose genius is an infinite capacity for taking pains. *Poeta nascitur non fit*; he must be able to toss off a sonnet with his 'night-cap' before stepping into bed. Sir Hudibras's methods are not so much to their minds as those of Squire Ralph:

Whose knowledge was not far behind
The knight's, but of another kind,
And he another way came by't;
Some call it gifts and some new light;
A liberal art that costs no pains
Of study, industry, or brains.

Gray's immortal elegy, which took eight years to complete, is, on this basis of measurement, not poetry. But Cecil's saying of Sir Walter Raleigh, 'I know he can toil terribly,' is true of genius in every sphere of activity. Shakespeare's knowledge is as wide as his range. He must have been an omnivorous reader, an observant and diligent student of men and affairs. Originality, imagination, comprehensiveness of soul, sensibility to impression, sincerity, sym-

pathy, emotion, eloquence, a just sense of proportion, and a delicate appreciation of musical sound, are some of the chief elements of genius; but all are useless without that boundless energy of mind, that self-denying tenacity of purpose, which exercises and cultivates them and transmutes capacity into imperishable work. A few writers like Rousseau may learn more from men than from books, more by meditating on their own experiences than by meditating on the experiences of others; but to produce work that will quicken the intellect, stir the emotions, and fire the imagination, they must not only think truly, feel deeply, and imagine nobly, they must 'toil terribly.'

A good measure of genius has been thus described by La Bruyère: 'Whenever,' he says, 'the perusal of a book elevates your mind and inspires you with noble and courageous sentiments, do not seek for any other measure to judge the work: that work is good and written by the hand of a master.'

JOHN MACNAB: A COMEDY FOR POACHERS.

By JOHN BUCHAN, Author of *John Burnet of Barns*, *Greenmantle*, &c.

CHAPTER III.—*continued.*

THE recipient of the ginger-beer was still sitting by the shafts of his cart. He seemed to be lunching, for with a gully-knife he was carving attentively a hunk of cheese and a loaf-end. As he looked up from his task, Leithen saw a child of perhaps twelve summers with a singularly alert and impudent eye, a much-freckled face, and a thatch of tow-coloured hair bleached almost white by the sun. His feet were bare, his trousers were those of a grown man, tucked up at the knees and hitched up almost under his armpits, and for a shirt he appeared to have a much-torn jersey. Weather had tanned his whole appearance into the blend of grays and browns which one sees on a hillside boulder. The boy nodded gravely to Leithen, and continued to munch.

Below the wood lay the quarter-mile where the Larrig wound sluggishly through a bog before precipitating itself into the chasm above the bridge of Larrig. Leithen left his bicycle by the roadside and crossed the waste of hag and tussocks to the water's edge. It looked a thankless place for the angler. The clear streams of the Larrig seemed to have taken on the colour of their banks, and to drowse dark and deep and sullen in one gigantic peat-hole. In spite of the rain of yesterday there was little current. The place looked oily, stagnant, and unfishable—a tract through which salmon, after mounting the fall, would hurry to the bright pools above.

Leithen sat down in a clump of heather and lit his pipe. Something might be done with a

worm after a spate, he considered, but any other lure was out of the question. The place had its merits for every purpose but taking salmon. It was a part of the Strathlarrig water outside the park pale, and it was so hopeless that it was not likely to be carefully patrolled. The high-road, it was true, ran near, but it was little frequented. If only. . . . He suddenly sat up, and gazed intently at a ripple on the dead surface. Surely that was a fish on the move. . . . He kept his eyes on the river, until he saw something else which made him rub them and fall into deep reflection. . . . He was roused by a voice at his shoulder.

'What for will they no' let me come up to Crask ony mair?' the voice demanded in a sort of tinkler's whine.

Leithen turned and found the boy of the ginger beer. 'Hullo! You oughtn't to do that, my son. You'll give people heart disease. What was it you asked?'

'What . . . for . . . will . . . they . . . no' . . . let . . . me come . . . up to Crask . . . ony mair?'

'I'm sure I don't know. What's Crask?'

'Ye ken it fine. It's the big hoose up the hill. I seen you come down frae it yoursel' this mornin'.'

Leithen was tempted to deny this allegation and assert the rôle of a tourist, but something in the extreme intelligence of the boy's face suggested that such a course might be dangerous. Instead, he said, 'Tell me your name, and what's your business at Crask?'

'My name's Benjamin Bogle, but I get Fish Benjie frae most folk. I've sell't haddies and flukes to Crask these twa months. But this mornin' I was tell't no' to come back, and when I speired what way, the auld wife shut the door on me.'

A recollection of Sir Archie's order the night before returned to Leithen's mind, and with it a great sense of insecurity. This argus-eyed child, hot with a grievance, had seen him descend from Crask, and was therefore in a position to give away the whole show. What chance was there for secrecy with this malevolent scout hanging around? 'Where do you live, Benjie?' he asked.

'I bide in my cairt. My father's in jyle, and my mother's lyin' badly in Muirtown. I sell fish to a' the gentry.'

'And you want to know why you can't sell them at Crask?'

'Ay, I wad like to ken that. The auld wife used to be a kind body and gie me jeely pieces. What's turned her into a draygon?'

Leithen was accustomed in the duties of his profession to quick decisions on tactics, and now he took one which was destined to be momentous. 'Benjie,' he said solemnly, 'there's a lot of things in the world that I don't understand, and it stands to reason that there must be more that you don't. I'm in a position in which I badly want somebody to help me. I like the look of you. You look a trusty fellow and a keen one. Is all your time taken up selling haddies?'

'Deed no'. Just twa hours in the mornin', and twa hours at nicht when I gang down to the cobbles at Inverlarrig. I've a heap o' time on my hands.'

'Good. I think I can promise that you can resume your trade at Crask. But first I want you to do a job for me. There's a bicycle lying by the roadside. Bring it up to Crask this evening between six and seven. Have you a watch?'

'No, but I can tell the time braw and siccar.'

'Go to the stables and wait for me there. I want to have a talk with you.' Leithen produced half-a-crown, on which the grubby paw of Fish Benjie instantly closed. 'And look here, Benjie—you haven't seen me here, or anybody like me; above all, you didn't see me come down from Crask this morning. If anybody asks you questions, you only saw a man on a bicycle on the road to Inverlarrig.'

The boy nodded; his solemn face flickered for a second with a goblin smile.

'Well, that's a bargain.' Leithen got up from his couch and turned down the river, making for the bridge of Larrig, where the highway crossed. He looked back once, and saw Fish Benjie wheeling the bicycle into the undergrowth of the wood. He was in two minds as to whether he had done wisely in placing himself in the hands of a small raga-

muffin who, for all he knew, might be hand-in-glove with the Strathlarrig keepers. But the recollection of Benjie's face reassured him. He did not look like a boy who would be the pet of any constituted authority; he had the air rather of the nomad against whom the orderly world waged war. There had been an impish honesty in his face, and Leithen, who had a weakness for disreputable urchins, felt that he had taken the right course. Besides, the young sleuth-hound had got on his trail, and there had been nothing for it but to make him an ally.

He crossed the bridge, avoided the Crask road, and struck uphill by a track which followed the ravine of a burn. As he walked his mind went back to a stretch on a Canadian river, a stretch of still, unruffled water warmed all day by a July sun. It had been as full as it could hold of salmon, but no artifice of his could stir them. Thither in the late afternoon had come an aged man from Boston, who fished with a light trout-rod and cast an artful line, and placed a curious little dry fly several feet above a fish's snout. Then, by certain strange manœuvres, he had drawn the fly under water. Leithen had looked on and marvelled while before sunset that ancient man hooked and landed seven good fish. . . . Somehow that bit of shining, sunflecked Canadian river reminded him of the unpromising stretch of the Larrig he had just been reconnoitring.

At a turn of the road he came upon his host, tramping homewards in the company of a most unprepossessing hound. I pause for an instant to introduce Mackenzie. He was a mongrel collie of the old Highland stock known as 'beardies,' and his touzled head, not unlike an extra-shaggy Dandie Dinmont's, was set upon a body of an immense length, girth, and muscle. His manners were atrocious to all except his master, and local report accused him of every canine vice except worrying sheep. He had been christened the 'Bluidy Mackenzie,' after a noted persecutor of the godly, by some one whose knowledge of history was greater than Sir Archie's, for the latter never understood the allusion. The name, however, remained his official one; commonly he was addressed as Mackenzie, but in moments of expansion he was referred to by his master as Old Bloody.

The said master seemed to be in a strange mood. He was dripping wet, having apparently fallen into the river, but his spirits soared, and he kept on smiling in a light-headed way. He scarcely listened to Leithen, who told him of his compact with Fish Benjie. 'I daresay it will be all right,' he observed idiotically. 'Is your idea to pass off one of his haddies as a young salmon on the guileless Bandicott?'

For an explanation of Sir Archie's conduct the chronicler must retrace his steps.

After Leithen's departure it had seemed good to him to take the air, so, summoning Mackenzie

from a dark lair in the yard, he made his way to the river—the beat below the bridge and beyond the high-road, which was on Crask ground. There it was a broad, brawling water, boulder-strewn and shallow, which an active man could cross dry-shod by natural stepping-stones. Sir Archie sat for a time on the near shore listening to the sand-pipers—birds which were his special favourites—and watching the whinchats on the hillside and the flashing white breasts of the water-ousels. Mackenzie lay beside him, an uneasy sphinx, tormented by a distant subtle odour of badger.

Presently Sir Archie arose and stepped out on a half-submerged boulder. He was getting very proud of the way he had learned to manage his game leg, and it occurred to him that here was a chance of testing his balance. If he could hop across on the stones to the other side he might regard himself as an able-bodied man. Balancing himself with his stick, as a rope-dancer uses his pole, he in due course reached the middle of the current. After that it was more difficult, for the stones were smaller and the stream more rapid, but with an occasional splash and flounder he landed safely, to be saluted with a shower of spray from Mackenzie, who had taken the deep-water route. 'Not so bad that, for a crock,' he told himself, as he lay full length in the sun watching the faint line of the Haripol hills over-topping the ridge of Crask.

Half-an-hour was spent in idleness, till the dawnings of hunger warned him to return. The crossing as seen from this side looked more formidable, for the first stones could be reached only by jumping a fairly broad stretch of current. Yet the jump was achieved, and with renewed confidence Sir Archie essayed the more solid boulders. All would have gone well had not he taken his eyes from the stones and observed, on the bank beyond, a girl's figure. She had been walking by the stream and had stopped to stare at the portent of his performance. Now, Sir Archie was aware that his style of jumping was not graceful, and he was discomposed by this sudden gallery. Nevertheless, the thing was so easy that he could scarcely have failed had it not been for the faithful Mackenzie. That animal had resolved to follow his master's footsteps, and was jumping steadily behind him. But, three boulders from the shore, they jumped simultaneously, and there was not standing-room for both. Sir Archie, already nervous, slipped, recovered himself, slipped again, and then, accompanied by Mackenzie, subsided noisily into three feet of water.

He waded ashore, to find himself faced by a girl in whose face concern struggled with amusement. He lifted a dripping hat, and grinned. 'Silly exhibition, wasn't it? All the fault of Mackenzie! Idiotic brute of a dog, not to remember my game leg!'

'You're horribly wet,' the girl said, 'but it

was sporting of you to try that crossing. What about dry clothes?'

'Oh, no trouble about that. I've only to get up to Crask.'

'You're Sir Archibald Roylance, aren't you? I'm Janet Raden. I've been with papa to call on you, but you're never at home.'

Sir Archie, having now got the water out of his eyes, was able to regard his interlocutor. He saw a slight girl with what seemed to him astonishingly bright hair, and very blue and candid eyes.

She appeared to be anxious about his dry clothes, for she led the way up the bank at a great pace, while he limped behind her. Suddenly she noticed the limp. 'Oh, please forgive me. I forgot about your leg. You had another smash, hadn't you, besides the one in the War—steeplechasing, wasn't it?'

'Yes, but it didn't signify. I'm all right again, and get about anywhere, but I'm a bit slow on the wing, you know.'

'You're keen about horses?'

'Love 'em.'

'So do I. Agatha—that's my sister—doesn't care a bit about them. She would like to live all the year at Glenraden, but—I'm ashamed to say it—I would rather have a foggy November in Warwickshire than August in Scotland. I simply dream of hunting.'

The ardent eyes and the young grace of the girl seemed marvellous things to Sir Archie. 'I expect you go uncommon well,' he murmured.

'No, only moderate. I only get scratch mounts. You see, I stay with my Aunt Barbara, and she's too old to hunt, and has nothing in her stables but camels. But this year——' She broke off as she caught sight of the pools forming round Sir Archie's boots. 'I mustn't keep you here talking. You be off home at once.'

'Don't worry about me. I'm wet for days on end when I'm watchin' birds in the spring. You were sayin' about this year?'

Her answer was a surprising question. 'Do you know anybody called John Macnab?'

Sir Archibald Roylance was a resourceful mountebank, and did not hesitate. 'Yes. The distiller, you mean? Dhuinewassel Whisky? I've seen his advertisements—"They drink Dhuinewassel, in cottage and castle." That chap?'

'No, no, somebody quite different. Listen, please, if you're not too wet, for I want you to help me. Papa has had the most extraordinary letter from somebody called John Macnab, saying he means to kill a stag in our forest between certain dates, and daring us to prevent him. He is going to hand over the beast to us if he gets it, and pay fifty pounds, but if he fails he is to pay a hundred pounds. Did you ever hear of such a thing?'

'Some infernal swindler,' said Archie darkly.

'No. He can't be. You see, the fifty pounds arrived this morning.'

'God bless my soul!'

'Yes. In Bank of England notes, posted from London. Papa at first wanted to tell him to go to—well, where papa tells people he doesn't like to go. But I thought the offer so sporting that I persuaded him to take up the challenge. Indeed, I wrote the reply myself. Mr Macnab said that the money was to go to a charity, so Agatha is having the fifty pounds for her native weaving and dyeing—she's frightfully keen about that. But, if we win the other fifty pounds, papa says the best charity he can think of is to prevent me from breaking my neck on hirelings, and I'm to have it to buy a hunter. So I'm very anxious to find out about Mr John Macnab.'

'Probably some rich Colonial who hasn't learned manners.'

'I don't think so. His manners are very good, to judge by his letter. I think he is a gentleman, but, perhaps, a little mad. We simply *must* beat him, for I've got to have that fifty pounds. And—and I want you to help me.'

'Oh well, you know—I mean to say—I'm not much of a fellow—'

'You're very clever, and you've done all kinds of things. I feel that if you advised us we should win easily, for I'm sure you had far harder jobs in the War.'

To have a pretty young woman lauding his abilities and appealing with shining eyes for his aid was a new experience in Sir Archie's life. It was so delectable an experience that he almost forgot its awful complications. When he remembered them he flushed and stammered. 'Really, I'd love to, but I shouldn't be any earthly good. I'm an old crock, you see. . . . But you needn't worry—your Glenraden gillies will make short work of this bandit. . . . By Jove, I hope you get your hunter, Miss Raden. You've got to have it somehow. Tell you what, if I've any bright idea I'll let you know.'

'Thank you so much. And may I consult you if I'm in difficulties?'

'Yes, of course. . . . I mean to say, no. . . . Hang it, I don't know, for I don't like interfering with your father's challenge.'

'That means you will. Now, you mustn't wait another moment. Good-bye. Will you come over to lunch at Glenraden?' Then she broke off and stared at him. 'I forgot. Haven't you smallpox?'

'What! Smallpox? Oh, I see! Has old Mother Claybody been putting that about?'

'She came to tea yesterday, twittering with terror, and warned us all not to go within a mile of Crask.'

Sir Archie laughed somewhat hollowly. 'I had a bad toothache and my head tied up, and I daresay I said something silly, but I never thought she would take it for gospel. You see

for yourself that I've nothing the matter with me.'

'You'll soon have pneumonia the matter with you, unless you hurry home. Good-bye. We'll expect you to lunch the day after to-morrow.' And with a wave of her hand she was gone.

The extraordinary fact about Sir Archie was that he was not depressed by the new tangle which encumbered him; on the contrary, he was in the best of spirits. He hobbled gaily up the by-road to Crask, listened to Leithen, when he met him, with less than half an ear, and was happy with his own thoughts. I am at a loss to know how to describe the first shattering impact of youth and beauty on a susceptible mind. The old plan was to borrow the language of the world's poetry, the new seems to be to have recourse to the difficult jargon of psychologists and physicians; but neither, I fear, would suit Sir Archie's case. He did not think of nymphs and goddesses or of linnets in spring; still less did he plunge into the depths of a subconscious self which he was not aware of possessing. The unromantic epithet which rose to his lips was 'jolly.' This was for certain the jolliest girl he had ever met—regular young sportswoman, and amazingly good-lookin', and he was dashed if she wouldn't get her hunter.

For a delirious ten minutes, which carried him to the edge of the Crask lawn, he pictured his resourcefulness placed at her service, her triumphant success, and her bright-eyed gratitude. Then he suddenly remembered that alliance with Miss Janet Raden was treachery to his three guests. The aid she had asked for could be given only at the expense of John Macnab.

Sir Archie was in the miserable position of having a leg in both camps, of having unhappily received the confidences of both sides, and, whatever he did, he must make a mess of it. He could not desert his friends, so he must fail the lady; wherefore there could be no luncheon for him the day after to-morrow, since another five minutes' talk with her would entangle him beyond hope. There was nothing for it but to have a return of small-pox. He groaned aloud. 'A twinge of that beastly toothache!' he explained in reply to his companion's inquiry.

(Continued on page 83.)

TO-MORROW.

TIME brings us countless gifts,
But *one* he has withheld;
One who each morning lifts
Her tent, as though compelled
To shun the grasp of mortal hands.
Oh, longed-for, loved To-morrows!
Each poor heart understands
Vain yearning, chief of sorrows!

Shall we not capture her,
This fair maid, fleeing ever?
In vain our eager pulses stir—
Old Time says sternly, 'Never!'

MRS M. BUCHANAN.

MALTA. THE KEY OF THE MEDITERRANEAN.

By ALBERT G. MACKINNON,

Author of *Malta, the Nurse of the Mediterranean; Hospital Jock, &c.*

I.

SIZE is not essential to a key. In fact the smaller it is the better. Its usefulness depends on its fitting the lock. Malta possesses to perfection the quality of smallness. Twenty miles by eight holds together a compact little island, which at short notice can be turned into a solid fortress, and some of the greatest men and races have realised that it guarded the western door of Europe.

Napoleon and Nelson differed on this. The former recognised it as a key, and greedily seized it. His eyes were on Egypt, and his ambition was to make the Mediterranean a French lake. Nelson felt that Britain's safety lay in the Empire of the Sea, and he shifted the pivot point to the Atlantic. Later he changed his view of Malta, and called it 'the strongest place in Europe.'

In these days circumstances have arisen which make the Mediterranean once more a bigger strategic centre than the larger ocean, and Malta comes again under focus, for the flag that flies over this island stretches from Gibraltar to Port Said.

What gives Malta this pre-eminence amongst all its sister islands? Geography and harbours. It is in the very centre of the Mediterranean. It is the last visible vestige of that belt of land which once joined Europe to Africa, and divided the Mediterranean into two seas. On it have been dug up the fossilised skeletons of animals which could only have lived on the big continents, and these bones trace for us to-day a sketch of ancient geography.

Its ruins prove that it was a key position in prehistoric times. The Gigantia, Hagiar Kim, Mnajdra, and the other temples which are being unearthed, take us back to the beginning of things, and show us Malta as the 'Holy Island' of southern Europe. Possibly these structures began as tombs where the spirits of the dead were honoured. Then they developed into centres of star worship, and with the arrival of the Phœnicians were changed into Baal temples. Certain it is that many secrets of the Neolithic and Bronze Ages lie buried on this island awaiting the spade of the excavator.

II.

Of the Mediterranean race which preceded the Phœnicians we catch only an imperfect shadow. Of all their doings, their religion, petrified into those stone monuments, alone remains to testify to their existence. To those devotees of a rude faith Malta was sacred ground.

The Phœnicians were perhaps the first to discover Malta as a key to the West. These

adventurers of the Bronze Age had, with the spirit of a Columbus, pushed their galleys ever farther westwards until they discovered the tin of Cornwall, which made bronze implements possible. On the track of their ships lay this little island with its safe harbours. No wonder they grasped its importance, and bequeathed to it as the reward of their occupancy the greatest gift one nation can give another—a language. Where they got it is largely hid in mystery; possibly it is closely allied to ancient Syriac. A recent book proves its resemblance to Persian, and gives several hundred words which are identical in both languages. Two things mark the antiquity of the Maltese language. The first is the fact that it has changed so little. This is the more extraordinary when one remembers how many nations with different tongues held Malta under their sway. When we think how English has changed from the days of Chaucer, and recall the fact that Maltese is the same as it was 3000 years ago, we are amazed at this living link with the past. Of course it has acquired foreign words, but these form a surprisingly small fraction of its speech.

The second fact that anchors, as it were, Maltese to its moorings, is that the roots of its words are the three guiding letters which never change. This is the hall-mark of the East.

Carthage was the next great nation to see that Malta was the key to the West, and from about 550 B.C. to 216 B.C. it used this island as a base for its European expansion. Of course the Carthagians were in a fashion brothers to the Maltese. They may not, therefore, have come by conquest but by mutual consent, for Malta had always to pay this penalty for its smallness, that it could not stand alone. With the fall of the great cities of Phœnicia it had to lean on another prop, and Carthage was the natural one.

Joshua did more for the world than he thought when he knocked down the walls of Jericho and disturbed the old Canaanites in their nest. They had to push out and forage elsewhere, and they did that to some purpose when their colony became a greater power than even the motherland. A big brother may sometimes be a bit of a bully, but the youngster will take from him what he would not tolerate from another. Malta recalls the glory of Carthage as if she shared in it, and the self-government of those days has formed a plank in the recent argument for Home Rule. Still, if history be read aright, the Maltese were not unhappy when the consul, Titus Sempronius, freed them from the bullying of their big brother. He had simply a walk-over. It looked as if Malta had had

enough of relatives, and preferred strangers. For 600 years it had a taste of Roman imperialism, and viewed the eagle from between its talons. Cicero throws Malta into the limelight in his attack on Verres, the absent governor, whose hands, however, were longer than his feet and stretched to the coffers of Malta, while his feet remained on the shore of Sicily. Cicero's laugh breaks through his words when he says: 'I do not ask now whence you got those 400 jars of honey, or such quantities of Maltese cloth, or fifty cushions for sofas, but what could you want with so many Maltese garments? as if you were going to dress all your friends' wives!' Poor Verres, he had been caught in the act of looting by a clever critic and a friend of the Maltese, for Cicero liked Malta, and pictured it as a good place to grow old in—only he did not get the chance. Cicero goes up in my estimation for having discovered what Englishmen have yet failed to do, that Malta as a health resort is hard to beat. It would at least have been a healthier spot for him than Rome. Had Cicero lived up to his words and sought a retreat beneath the shades of the Boschetto gardens, perhaps in that romantic grotto whose age is as much a puzzle as that of the Sphinx, the literature of the world would have been enriched and the burden of the modern school-boy augmented.

III.

Malta changed masters again, and for the worse, when Theodosius, the surviving son of Constantine, divided the Roman Empire finally into two parts, one for each of his sons, and Malta was brought under Byzantine rule. The strange thing about Malta is that though its roots are in the East its branches stretch towards the West. Asia, the continent of its birth, like a cruel mother, was the source of its greatest dangers, while Europe, though alien in race and tongue, became its benefactress.

Five hundred years is a good slice of the world's history, and too big a bit of Byzantine dominance for Malta to digest. She was sick of it long before relief came. There was no Home Rule in those days; therefore, when the Arabs, getting heady with success, realised that Malta must be their stepping-stone to European empire, they found it under their feet. Though Malta was Christian it welcomed its Moslem cousin, and, according to most accounts, the Arab proved a gentleman, at least of those times.

When the Normans' turn came for World-Power, Malta was quite ready to receive its new master in Count Roger, whose bloodless and brilliant entry in to the island has formed the subject of many a brush; though the kneeling crowd of suppliants must not be mistaken for Maltese. They were really the Greek slaves of the Arab rulers, who solicited liberty not in vain.

The blows that went to the shaping of present-

day Malta were many and hard, and had the human material been brittle, the Maltese race would have been broken up ages ago. But it clung with tenacity to three things—its island, its language, and its church.

The Knights of St John of Jerusalem were the masters that cast the greatest glamour of romance over this island, which they made their home from 1530 to 1798. In their day it indeed became the key of the Mediterranean, and on its bastions the power of Turkey broke in vain. All Europe pealed its bells in frantic joy over the victory. But it was a case, I fear, of 'Me and Betty killed the bear.' The Christian nations whose safety trembled in the balance were content to see the heroic little island bleed white in their defence. I know the 'Knights' deserve the glory, those wounded warriors who with drawn swords sat in chairs in the breach at St Elmo and died rather than give way. In that glamour the heroism and skill of the native are apt to be overlooked. Yet let me relate just one little incident to show how the Maltese saved the day. And to see them plunging about like porpoises in the harbour one does not wonder at their success.

The Turk, after Fort St Elmo was captured, prepared a great assault on the spur of St Michael. For this purpose he transported by land eighty galleys from the Marsamuscetto over the heights of Sceberras to the Grand Harbour. To counter this De Vallette selected a band of Maltese swimmers, who underneath the water built a stockade right across that part of the inlet. When at last the Turkish commander had with great difficulty launched his ships in the opposite harbour he was enraged to find that all his labour had been in vain, that his boats were prisoners behind a stockade they could not pass. At once he gave orders to all who could swim to go out and cut down this barrier. De Valette saw their move and held in hand a body of picked Maltese swimmers. As soon as the Moslems had got well out from the shore he unleashed this force. With daggers between their teeth they plunged into the waves. The more clumsy Moslems had no chance; the agile Maltese dived below his victim and struck him the fatal blow from underneath. The harbour was soon red with Moslem blood, and hardly one of the Turks was allowed to reach the shore. This daring deed certainly saved Malta, and for that matter Europe itself. Yet how little gratitude Christendom has shown to the swimmers of Malta!

IV.

Napoleon, as we have already said, saw that Malta was the key position of the East, and spared no pains to capture it and hold it for two years, until the British, in conjunction with the Maltese, compelled the French to surrender in 1800.

The Maltese hailed the advent of the British with joy, and gave vent to furious indignation when Britain, reluctant to take on more responsibilities, suggested restoring the island to the Knights of St John. At that time the Mediterranean was not the sea route to the East, and the importance of a naval base on that highway was not sufficiently realised. Sir Alexander Ball, R.N., the first British Governor, however, soon awoke to the importance of the island. The very fact that Britain lay outside the Mediterranean became the secret of Malta's prosperity. All the great Powers with interests in the Mediterranean were in possession of good bases for their fleet on that sea. France had Toulon; Italy, Spezia and Naples; Austria, Pola and Sebenico; Spain, Cartagena; Britain had none. Hence millions of money began to flow into this little island as gradually its dock-yard grew. What Britain has done for Malta can be seen from the study of cold figures.

In 1804, when Captain Otway, R.N., arrived in Malta and began to push things on, he

demanding the services of 170 men for the dock-yard, while to-day over 10,000 are employed. Then the total weekly pay amounted to £95, now it reaches £14,000. No wonder the other day ten thousand Maltese assembled to express their loyalty to the British crown, and to disown their Premier for his pro-Italian speeches. The bread is buttered too thickly by our navy!

As a stepping-off ground for our troops in time of emergency, and as 'The Nurse of the Mediterranean' in days of war, Malta has played its part in the British Empire; and as once more the Mediterranean supersedes the Atlantic as the strategic centre of the seas, it resumes its important rôle as one of the principal keys of empire.

But the great charm of this picturesque island, which Lord Granville called, the other day, the most beautiful place he had seen, is the sapphire of the waves which wash its shores. It is the Mecca of swimmers; for surely nowhere else does the sea stretch out such soft, warm, glistening arms to clasp the diver from its rocks.

THE WILL OF ALA ABDUL

By RAYMOND COULSON, Author of *The Towers of Yaghistan*.

I.

DURRANT, toiling in the baked air of a Peshawar June, received this letter:

'DURRANT,—If you can take your leave in Kashmir, will you meet me by the Black Pavilion in the Shalimar Bagh of my good ancestor Jehangir in the first week of September? I cannot say precisely when I shall get through, but if Allah wills I shall be there in the first week of September.

'I expect I shall be a sick man, Durrant, when I arrive—if I arrive. I pray that I may see you before I go to the peace of God.—Your friend,
ALA ABDUL MOHAMMED KHAN.'

Durrant felt the paper, smelt it, examined the postmarks. It was a shiny gray paper, perfumed faintly with the smell of Central-Asian travel—the smell of sheepskins and wood-smoke and burning dung. The letter was dated from Samarkand, but had been posted in Constantinople. If Ala Abdul was coming through from Samarkand to Kashmir, he would travel by the trade route across the Karakoram and the Zoji-La Pass. Durrant pondered. Ala Abdul would have given the letter to a friend going through to Europe to post in the first safe place. It had travelled all across the chaos of Russian Turkestan, been posted in Constantinople, come south again through the Red Sea, and now reached him here on the Frontier of India. A journey like the journeys of Ala Abdul. He must be pretty bad, pretty sure of

death, to write like that—'a sick man, when I arrive—if I arrive.' That Karakoram route, with its eighteen-thousand-foot pass, was a queer journey for a sick man. The sort of thing Ala Abdul would do in order that he might meet his friend, and die in the most beautiful place in the world.

By the same mail was a letter from his cousin Ethel Durrant, dated from Stokehayes. Ethel nearly always was at Stokehayes. He never saw the name on a postmark without a thrill of longing for that red house of three-hundred-year-old brick, set with its chestnuts and beeches among the home meadows, environed with the crooning of doves and indifferent to the march of time.

Ethel wrote:

'DEAR JACKO,—I wish I could send you a breath of Stokehayes air. Every Spring it seems more beautiful. I have been trying to write it for you, but found I couldn't, so I tore it all up, and this week's letter will be short if I am to catch the mail.

'We had Sir Philip Richardson here for the week-end. He talked about you. He says that with the Intelligence work you've done and are able to do, it's absolute nonsense your mugging along as a regimental officer. He was talking about your journey last year after Haji Sufdur Ali and the Friends of the Morning. Intelligence thinks great shakes of you. Why don't you drop the regiment and go bang for the Indian Political side?

'By the way, do you ever hear anything of poor Ala Abdul? I often wonder where he can be wandering. I have a feeling that he is not well, and is in great distress.—Yours, ETHEL'

Durrant sat for a long time with the letter in his hand. 'Poor Ala Abdul'—it was the sort of phrase she might have used unconsciously had she known that Ala Abdul loved her. But he would never have said anything of that to her, any more than he would have said anything of it to Durrant. Durrant had guessed it long ago, though he was not usually subtle in these matters. Assuredly she must know. She was so wise, that girl, the head of his family, dreaming there among the portraits of his ancestors and hers, who had shed their blood for Stokehayes all up and down the world, and been cast away and buried in most of its far ends. She knew so much, that serene, tall cousin of his. She was so wise.

He got up, shook himself vigorously, and called the bearer to bring his bath. It did not do any good for him to be dreaming about Ethel. It did not do any good. So often, so often he had to tell himself that. She was the owner of Stokehayes and the head of the family, of which he was but a little cadet.

II.

Durrant talked to his colonel that night, and put in his leave application next morning. As to this there was no difficulty. Durrant had a record and a character worth much gold, not merely with divisional generals, but even with the exalted of Simla, and his confidential *dossier* bore notes and comments that some would have given their souls for. So there was no difficulty about his leave.

There are several ways into Kashmir, but, happily, all are long, and none is a railway. You may go by way of Abbottabad, where the Gurkha regiments have their home among roses, or through Poonch with its many toilsome hills and ravines, or by way of Rawalpindi. The Pindi route was most convenient for Durrant. There he left the train and took the two-hundred-mile road that winds through great hills, with sheer cliffs rising on the one hand, and on the other sheer precipices falling five hundred feet to the churned and tortured water of Jhelum River. The road goes thus to the gorge that is the narrow gate of the valley of Kashmir, and there the country the gods made in a moment when they forgot that man is cursed opens on each hand, and the road runs under the snows, across the green levels of the valley floor to Srinagar, set among its many waterways.

At Srinagar Durrant hired a large doonga-houseboat. Ala Abdul would need repose. He hired many cushions, and soft silken hangings of Kashmir embroidery. Ala Abdul loved all beautiful things. Durrant had arrived on 30th

August. On the afternoon of the next day he set out, with the servants' living-boat and the little light paddle-boat trailing behind, through the water-gate that leads by way of orchards and floating gardens, and many flowered meadows, to the Dal Lake and the Shalimar Bagh. At sunset they were passing under the *Takht-I-Sulaiman*—the Throne of Solomon—that towers a thousand feet above the lake and drops through pine trees, and grass, and sheer rock to the water.

That night, camped among willow trees where the lapping of the water and the rustle of the leaves were the only sounds, and where presently the moon came over the great mass of Mahadeo, and shone on the snows of Haramoukh, and turned the lake to silver, Durrant sat all alone in the front of his houseboat, wondering where his friend could then be.

At sunrise they moved off again, the boatman paddling almost silently across the lake, that was covered with the great Kashmir lotuses. Durrant lay in his couch watching the pink lotus flowers drift by, and the dragon-flies playing among them, and here and there the spearers of fish already at work in their little boats. At noon they reached the Shalimar, that old Moghul garden set on its terrace above the lake, on the most beautiful site in the world, and Durrant's servants spread his meal on the grass beside the pavilion of black marble, and there he waited.

III.

He waited for a week in the Shalimar. The days passed. They did not matter. He had still another five weeks' leave. Sooner or later, he knew, Ala Abdul would come, if he was still upon this earth. So he waited and dreamed in the garden that the Great Moghul, the Emperor Jehangir, made three hundred years ago for dreaming in. While Durrant's ancestors were building Stokehayes, Ala Abdul's ancestor Jehangir was making the Shalimar.

On the seventh day, as he sat writing home to Stokehayes, Durrant heard a shuffling of feet on the path, and looking up, saw his friend approaching, supported on the arm and shoulder of a tall Kashmiri. Below were coolies and a litter, from which evidently he had just stepped. Gravely, in sonorous Persian, the friends saluted each other. The descendant of Jehangir, the modern, Westernised, Oxford-educated, sceptical, metaphysical son of Asiatic princes, was a tall, frail man. The long Persian travelling-robcs he wore increased his tallness and aspect of fragility. The big turban seemed to weigh on his head. His face, darkened with only the faintest creamy tint of brown, had all the aristocratic beauty of the high-caste Northern Mohammedan—the fine arched nose with the sensitive curve to the nostril, the high cheek-bones and large dark eyes under level brows. He was a cousin to the Amir of Afghanistan,

but, his family having once taken the wrong side in the sanguinary politics of that country, had had to leave it—a matter which had never troubled him much, for he was related to half Persia, and had large estates there.

Behind Ala Abdul came a little train of men, one carrying a large, rolled rug, one cushions, one a big hubble-bubble pipe with its reservoir of rose-water and long flexible stem. Ala Abdul would not sit down, but stood, supported by his Kashmiri. 'Wait, Durrant,' he said, smiling faintly; 'we will rest like lords.'

The man with the rug was cutting away its wrappings. With a jerk he unrolled it to the sunshine, and Durrant gasped at the splendour of crimson and blue spread there under the trees. Never before had he seen such a rug. It was a Bokhara rug, a variant of the familiar pattern new to him, executed with a staggering beauty of design, colour, and fineness.

'It was made in Samarkand for Jehangir,' said Ala Abdul. 'Men went blind in making it, and it was long in the making; and by the time it was finished Jehangir was shut away and his grandson ruled. So the rug remained in Samarkand, and there it stayed till I brought it away. I brought it for Ethel, Durrant.'

IV.

The cushions were piled, the hubble-bubble pipe was arranged beside them, and when all was ready they seated themselves.

'You are ill?' said Durrant.

'I am dying, Durrant.' He spoke indifferently. 'I shall carry this body for a week—perhaps two. It does not matter. I am already free.' His cheeks, indeed, were hollowed. In his weary eyes there was a glow like charcoal that has burned all night. From time to time he coughed, and as he placed his hand across his mouth, Durrant saw that it was wasted and almost transparent. 'I am nearly free now,' he said. 'There is only one more duty to do, and I shall be free.' He pulled at the pipe, then reclined and watched the perfumed smoke drift away under the lilac trees. 'I have to lay a task upon you, Durrant. Perhaps I may be sending you to your death. Who knows? The shuttle of fate has woven the pattern so. The task comes naturally to you, and your duty will make you go.'

'Can't shirk a job,' said Durrant curtly. 'What is it?'

'Only one more little move in this long game your people play. You must go up into Chinese Turkestan. There is a man in Yarkand to whom you must speak a word.'

Durrant glanced at him swiftly. He knew that the branch of Intelligence for which he worked had its own man in Yarkand—its very special man, known as G.21 on the files that are locked away in steel safes.

Ala Abdul saw the glance and again smiled

faintly. 'Yes, Durrant, I also have been in Yarkand,' he said. 'I saw G.21 lying out on a dunghheap, with his throat cut, and dogs worrying his flesh.'

'Fawcett gone!' Durrant stared at the fountains spraying their white against the shadowed marble of the pavilion. 'But how did you—how much do you know, Ala Abdul?'

'Listen, Durrant. When I left England for the last time, when I came away from Stoke-hayes, I laid this journey upon myself. I have seen much, Durrant, in the Caucasus and Persia and Turkestan. I have been to Moscow and seen Dzerjinsky. That man is like the Devil walking loose on the earth. I have been in the torture-chambers of the Black Sea *Cheka*. Aie, they did some queer things with me there.' He laughed contemptuously, and shook back the sleeve from his wrist, so that Durrant saw a great scar where the skin had been flayed away. 'They began on me the torture of the Gloves, and I began to talk. I told them much, all of it perfectly correct, so that they could check it, but poisoned with just the one drop of lying that put the whole thing wrong. They are not very subtle, those Northern Tartars. I had my lie already thought out for them before they began. I have talked much with their big men, Durrant. There are those, as you know, who think they are going to move all Turkestan down upon you, and raise all India behind your defensive line. And that must not be, Durrant. The civilisation of the Western peoples must not crash, because in our age it is among them that the living spirit moves. In a thousand places you peoples of the West are putting in your rivets to hold the world stable, and the game shifts and shifts, and still you work, you little indomitable ants. And now, here comes the task for you, a word to be spoken in the ear of a man in Yarkand, just one more little rivet to be placed.'

'Tell me about it,' said Durrant. 'Tell me how you come to be in the game. I did not know that, Ala Abdul.'

'I am not in it. Not officially at all. But I know much. I know of your journey last year, as a Punjabi fakir, after Haji Sufdur Ali and the Friends of the Morning.' Ala Abdul stopped to cough, and his whole body became racked with an anguish of coughing. When it was over he lay panting, exhausted, his forehead beaded with sweat. 'Aie, aie,' he gasped, 'the fogs and cold, wet airs of your home-country began it, Durrant, and the cellars of the Black Sea *Cheka* have finished it. I am frail, frail. I am too high bred. I am a terminal product, Durrant.'

V.

Durrant repacked the cushions, and presently Ala Abdul lay again at ease. 'Now, listen,' he said. 'You know—you know how it is with me—about Ethel?'

'Yes,' said Durrant. He shrank from the thought that he was going to discuss this. Ala Abdul was his friend. Durrant could talk to him with bared heart and mind unreserved about any subject on earth—except just this one subject. Always he had cursed the day when his friend had met Ethel, and been dragged from his serenity by an unconquerable and hopeless desire.

But Ala Abdul was as sensitive as a reed balanced in the wind. 'All right,' he said. 'I know, Durrant, I know. You do not think of us as black men, as *hubshis*, as negroes. But still there is the line of race. I know, I always knew it was impossible.' Again he smiled his remote and ironic smile, in which was already the calm of death. 'She the daughter of a great house. Impossible! And I also, Durrant, am the son of a great house. Impossible! I never said anything to Ethel, I never would have said anything; and had I spoken or not spoken, there would have been no hope. Always I knew that. She has a great heart, and was willing to be my friend—no more. But now, Durrant, when I came away from Stokehayes for the last time, I tried to think of some honourable gift that I might send her that would also be hard for me to get; and I thought of the rug of my ancestor Jehangir. We have always known it was there in Samarkand, in the family of the man who made it for us, and there has never been another rug made like it. And I thought that I would go and get it for Ethel, because there has never been another rug made like it, and as things are in Bokhara and all Turkestan, it would be very hard to get. So I made my journey, and it led me into the *Chelka*, and to Moscow, and over many thousands of troubled miles. But now, here is the rug. You must give it to Ethel for me. And it leads you, too, on a journey which may take you to death, but which you cannot avoid, because you are the man fitted for the task.'

'How soon must I go? Must I leave you, Ala Abdul?'

'No. If you will stay, there is time yet, before snow closes the Karakoram Pass, for you to see me out of this world. You have a boat? Let us get music, and float down Jhelum River, and be at peace for a time.'

Ala Abdul was carried to the boat and made comfortable on a divan. They crossed the lake, and amid much excited yelling of boatmen, shot like an arrow down through the Dal Gate, and so to the main river.

VI.

At Srinagar Durrant found a letter from Ethel:

'DEAR JACKO,—Here are three mails gone and no letter from you. If you are on one of your journeys you might have let me know. I pray

God all is well with you. I feel you and Ala Abdul are together, and danger threatens you both. Do write. ETHEL.'

He replied briefly, stating Ala Abdul's condition, and assuring her all was well with himself. And then, freed from the entanglements of life, they floated together down the river, and, as quietly as the boat moved, Ala Abdul floated out of life. For five days that last stage of Ala Abdul's journey lasted. Each evening, when the sun had set and the boat was moored for the night, they talked much, while away in the stern the musicians Durrant had brought on board played softly, and sang songs of love and the beauty of women and flowers.

One evening, just after the sun had set, they lay motionless on the wide and brimming river where it opens into the Wular lake. There was no ripple on the gray water. They seemed to float on another sky, in which the tall Chinara trees stood up dreamily; the meadows and orchards spread away and became lost in the expanse of water, that extends so smooth to the looming mass of the great mountains towering up through forests to the snows.

'Do you sometimes feel, Durrant,' said Ala Abdul, 'that in perfect beauty there is a perilousness, an imminent threat that it must dissolve and pass, like the rainbow on a bubble about to break?' He paused to listen to a bulbul that trilled among the willows. 'Ah, Durrant,' he said, 'perhaps if I had stayed in my own country, instead of learning all your Western lore, I should before now have been killed in battle, or poisoned in the Council Chamber, or have made myself ruler of a province, instead of just fading, fading, fading out in futility.'

Suddenly he remembered the code that he had tried to make his own. 'Sorry,' he said. 'Didn't mean to grouse. But it is true. You crude new Western peoples, there is something in you that is too strong for us. At the first touch of your West, the empire of my fathers crumbled and collapsed like rotten wood. Why, then, do I seek to support your power? It is because I must. We need you, and your strong and steady hand. The whole world leans on you, on you Western peoples, because the spirit of life is in you now. Once it was with us, but now on the plains of Persia the wind blows dead and rotting dust, and the spirit moves on, Westward, to the newer peoples.

'Perhaps there may come a day when it will leap the Pacific from America into China, and start the cycle again. But not in our age.' He smiled dreamily. 'Or is it just that my heart turns to the West? I think not. I think the truth is larger than that. . . . I can scarcely see you, Durrant . . . but listen. About Ethel. You knew what was in my heart. I also know

what is in yours. But with you there is no bar of race.'

'It is equally impossible,' said Durrant.

'I know. You think Stokehayes is poor, and needs much money, and Ethel must marry a rich man, or it will go to a Jew. All this I knew when I began my journey. Now I am a rich man. I am the last of my father's line. I sold my estates in Persia, Durrant. It does not matter. I am the last of my father's line. All that wealth is safe in England now, Durrant, and you will find my Will at the Alliance Bank of Simla, and it leaves everything to you, except the rug, which you must give for me to Ethel.'

'But, Ala Abdul——'

Ala Abdul reclined with his arms folded across his chest and his eyes closed. 'All will be well,' he said.

'But, Ala Abdul——'

Ala Abdul was already far away, but faintly from his lips came the phrase of princes: 'Peace; it is my will.'

VII.

Far into the night, as the driven coolies toiled upstream towing the *Doonga* toward Srinagar, Durrant, a hurricane lamp at his elbow, sat beside the body of his friend, enciphering a message to headquarters. Across his grief was struck a pulsating streak of fear, but he would not stop to think. His mouth was dry, his heart sagged in his chest, but he would not stop to think, and went laboriously on with his cipher. Before, he had never been afraid of any task, but now, but now—he might go home to Ethel.

Steadfastly he kept that thought away. By dawn he was at the telegraph office and had his message on the wires. Only when it had passed from his hands, and the sleepy-eyed telegraph-babu, dragged from his bed and grumbling at the difficult, meaningless groups of letters, was tapping it over, did Durrant feel the weight off his heart, and his fear gone, and peace in his soul. He was committed. He could not retreat now, but must take that journey. Simla, he knew, would select him for the task. He was the inevitable man.

But Simla is slow to move. For five days he had to wait, fretting out his soul until the order came releasing him for special duty. And at last he started.

Of that journey little may be told. The document, known to a very few as the Durrant Report, is not yet public property, nor are the things that Ala Abdul had told Durrant as they drifted down the river. But Durrant's task was, in brief, 'to speak a word in the ear of a man in Yarkand.' He had to turn that man, who hovered and swung between two courses, into the path that led to peace, and away from the path that led to chaos.

Durrant reached Yarkand and spoke his word. For a fortnight, with the knife ever at his throat, he wrestled and fought in subtle argument amid the gins and snares. At last there came an evening when he stepped out, dizzy with fatigue, into the clean air, from that chamber where the fate of thousands had been argued. He had won. Things would go the way of peace.

VIII.

A furtive, horn-spectacled Chinaman beckoned him into a narrow alley between mud walls. Unhesitatingly he followed. If this was his death that they calculated now, let it come. He could not resist.

But it was not death.

In a darkened room he was handed a sealed packet addressed to himself. It contained an engrossed document and a letter from Ala Abdul.

'MY FRIEND (he read),—Forgive me, Durrant, but it is not really a trick I have played on you, because after what I shall have told you, I know it will be possible for you to take only one course. Before you get this, you will have found that your journey here was necessary. The word you have come to speak had to be spoken, and I pray to Allah that you have won your fight for peace.

'But if you had not taken this journey, if you had gone straight to the Alliance Bank, you would have found there a copy of my Will, it is true, but only the unsigned draft of it. The true completed Will is here with this. To the last, you see, I am Oriental; I must have my little twist of fantasy.

'Forgive me—I have not doubted you. It was only for Ethel. Ethel's man must be tried and firm as steel. May all be well with you. For it is written "Those who seek pleasure find misery, but the strong follow the path of duty and are happy."—Your friend,

ALA ABDUL MOHAMMED KHAN.'

Two days after Durrant had got back to India and presented his report, he was sent for at headquarters. 'Young-fellow-my-lad,' said the chief, 'you may regard yourself as definitely shunted into the Political. We don't use razors to cut up Punjabis on recruits' parade. And if this thing turns out as big as it looks—if it turns out as big as it looks—'pon my soul, it ought to mean something big for you too.'

'Thanks, sir,' said Durrant; 'but what I particularly hanker after at this moment is six months' home leave.'

'Good boy. Your leave will take a week or two to come through, but meanwhile—well, meanwhile I don't see what's to hinder you from catching to-night's mail for Bombay, and the next boat home.'

Chambers's Journal

SEVENTH SERIES

JOHN O' GROAT'S.

By N. M. GUNN.

I.

THERE is a strange fascination for man in the idea of a place which is the end of things. Is not the whole history of world-exploration a history of the human desire to 'compass the ends of the earth'? And not only in the physical realm but in the poetic, too. 'Beyond the horizon's brim' lies the garden of the Hesperides, or the more magical (to a Gael, anyway) *Tir nan Og*, land of the ever-young; 'marvellous land, full of music, where the hair is primrose yellow and the body white as snow . . . and the hue of the foxglove is on every cheek.' So to the scientist, mathematician, philosopher—a reaching out to an end, an ultimate. Without as much, how stagnant, sterile, life would be!

Yet so constantly a 'striving and a striving and an ending in nothing' does the ambition prove itself, so often does the end turn to ashes or, at best, be recognised but as the first step in an endless aspiring, that unless man were fronted by some incalculable destiny, surely he would have grown tired of the game long, long ago; grown tired and cynical, and died.

World-old reflections, perhaps, that yet have a certain warmth of life when, for the first time, on a clear sunny day, you top the last ridge of Caithness county and look down on the land of John o' Groat's. In that first glimpse there is something of the magic of at least transient fulfilment, as though desire did at last manage to taste of its own dream. There is the last rim of the mainland, and beyond it the blue, blue sea, and set in the sea surely the Isles of the Blest! Truly a touch of enchantment rendered breathless by a faint incredulity. You turn your back, hoping the human, if mostly foolish, hope that the 'first fine rapture' may be recaptured in a second glimpse—suddenly to find that this gray flat land of Caithness you have been driving through, treeless, stone-diked, or fenced with great slate flags, has magically developed a mysterious charm, a breadth of atmosphere, a wonder of its own, that appeals as old tales of the clans and the Norsemen appeal, as sagas and poems of Ossian. For the prospect is now unquestionably on the grand scale, compelling, magnificent. Indeed,

it may well be that from no other spot in these islands can such a sense of illimitable horizons be obtained. A bare four hundred feet above sea level, yet the whole county stretches from your feet like a single moor, till a limit is set to it by Morven, that lodestar of Caithness fishermen, and the Sutherland peaks standing against the horizon like little cones. Southward the eye sweeps the whole extent of the Moray Firth, and imagines it can trace very faintly the dim outlines of the Moray hills on the other side. A complete history of the Moray Firth as a fertile fishing ground, embracing the habits, customs, and dress of the numberless generations of fishermen who have inhabited its creeks and harbours, would, I often think, be as fascinating and romantic a history as could well be written. Eastward the Moray Firth widens, merges, and gets lost in the North Sea, and in a moment the eye is baffled by the meeting of sea and sky in that faint line that is like the closing of mysterious lips. Then, suddenly turning back again, turning northwards, behold the blue waters once more, and the islands of the Orkneys and Stroma isle set in the blue waters!

It is difficult to refrain from phantasy should one happen to look on the Pentland Firth on a day of flying wind and sun. Even on the calmest day the waters are always in turmoil, sweeping their restless tidal way at anything from six to ten miles an hour, west or east, to the raging 'Men of Mey' or to the devouring 'Boars of Duncansby,' those tumultuous collisions of cross currents; but with sun behind one and the wind blowing, how intensely blue the colour, how white the tossing manes of the sea-horses, glistening, gleaming! It becomes easy to see how myth and legend found beginnings, how folk-lore and strange traditions thrived, and, what perhaps appeals more, how beginnings had necessarily to be born out of the stuff of heroism. Lives spent between those surging waters and this gray land had to be cast in a strong mould, and the bards' tales of their heroes, mythical or otherwise, had to be of a nature that inspired to deeds of endurance and courage and daring.

The thought sends the eye of its own accord across the Pentland, seeking nor-west for the

Brough of Birsay, which lies a little to the north of that visible headland of Hoy, standing so starkly there, face to the west. Somewhere off the fatal brough one night in June 1916, in a storm-ridden sea, the *Hampshire* went down. . . . The bards and the skalds, in the old sense, are dead, perhaps, but the old wonder and fear are still native to the heart, and who knows what 'myth' the historian of a thousand years hence may have to 'explain away'?

So one looks at the islands more curiously. Midway in the channel is the bare but picturesque-looking island of Stroma. It is not one of the Orkney group, and comes under the jurisdiction of the parish of Canisbay, in which John o' Groat's is situated. For any one with a whole day to spend, a row or a sail across (weather being suitable—which, alas! is the exception), and an exploration of the manifold points of interest, make a memorable excursion. Bearing about nor'-east, Skerry Lighthouse flashes in the sun like a white marble column, looking a very fairylike guard this fair day for the 'Stormy Pentland.' Then, stretching right and left, bounding the horizon in front, are the southern Orkneys. Rock-bound they look, raising their walls out of the water not unlike gargantuan battleships, anchored with that gray immobility that suggests titan power. A certain entrance is pointed out to you, the entrance to Scapa Flow. Scapa Flow, the *Hampshire*. . . . Suddenly you realise the sheer ancient and modern national importance of this 'end of things.' Galley and Dreadnought, Viking and War Minister: History repeats herself, however dressed for the occasion; the line of endeavour is continuous, and the heroic soul is still the heroic soul.

II.

The famous traditional John o' Groat's House is now nothing but a green mound, and to the present generation the name images little beyond white gleaming sands, where one hunts endless hours for the beautiful 'John o' Groat's buckies,' and the modern hotel with its 'every convenience,' from garage to wine cellar. There is a room in this hotel, which, on your remarking as to its somewhat curious shape, will possibly be the means of calling forth the story of the strange building of that house which is now the green mound, the house that has succeeded in giving its interesting name in perpetuity to this end of the world. The story, or tradition, as I have heard it, varies in the telling, but the generally accepted version is that given, I understand, by Dr Morison in his *Old Statistical Account of Canisbay*. It is a very human story, not without its parallel in more famous corners of world history. Stated briefly, it runs somewhat like this:

Three brothers, natives of Holland, Malcolm, Gavin, and John de Groat, came from the south of Scotland to Caithness during the reign of

James IV., with a letter from that Scottish monarch recommending them to the countenance and protection of his loving subjects in the county. They obtained lands in the parish of Canisbay, either by purchase or royal charter, and in the course of time so thrived that there came to be eight different proprietors of the name of Groat. To commemorate the date of their arrival in the county they established an annual feast, and on one such festive occasion the inevitable dispute arose on the all-important question of precedence. (Highland enough, these Dutchmen! though not possessing, it appears, the perfect aplomb of the chieftain who, in somewhat similar circumstances, dismissed the matter with the magnificent gesture: 'Wherever the Macpherson sits, that's the head of the table!'). John de Groat, now far on in years, settled what looked like the development of an ugly dispute by the cunningest interference and advice. In a voice full of the wisdom and toleration of the aged, he pointed out how well off they were in matters of worldly gear in this the land of their adoption; how fratricidal strife would leave them open to the attack of their enemies and would inevitably be their undoing; and how, if they would but behave themselves on the present occasion and go quietly home, he would guarantee them a satisfactory solution of the difficulty at the next meeting (for he was wise enough to know that advice alone rarely achieves human ends).

Having so persuaded them, the worthy John forthwith set about the erection of a house that would have eight walls, eight windows, and eight doors; and when in due course the octagonal house was completed, he placed inside it an oak table with eight sides. At the next meeting each entered by his own door and sat at an unquestionable head of the table; and so enchanted were they all with this most equitable arrangement that the old harmony was restored. Thus, like the Arthurian Round Table, came into existence John o' Groat's House (though it would seem, indeed, the wily Dutchman could have given points to the illustrious knights!).

One other explanation of the name may be given. It is certainly an ingenious one, and mentioned by Robert Mackay in his *History of the House of Mackay* as being traditional, though Calder, the Caithness historian, has been unable to find, he states, any such tradition in the county. Here it is:

John, a ferryman plying between Orkney and Caithness, had frequent disputes with his passengers about the fare, till in the end the magistrates took up the matter and fixed the charge at fourpence, or one *groat*, per head. Thereafter the ferryman was called Johnny Groat, and thus became the ancestor of the whole Groat family.

For devastating simplicity it certainly takes some beating, and if a libel on the house of

Groat—or, in other words, a manufactured 'tradition'—it all goes to show that the ways of the heathen Chinese in that which is 'child-like and bland' were not unknown to some derisive clansman bent on putting 'interloping foreigners' in their place!

One further and naively irresistible thing about this old house was recorded by the late 'Cairnduna' in one of his interesting northern articles to the *John o' Groat's Journal*, as having been extracted by him from the inside cover of the visitors' book 'kept at an old-world hospice at Huna.' Below a representation of the arms of the Groat family is the date 1839 and some writing, from which the following: 'It is stated in Chambers's *Picture of Scotland*, 3rd edition, volume 2, page 306, that the foundations or ruins of John o' Groat's House, which is perhaps the most celebrated in the whole world, are still to be seen.'

In history of a more or less northern importance the vicinity of John o' Groat's has been necessarily embroiled to a very great extent. Every small ferry in the Highlands has its own local history and traditions, but John o' Groat's represented the landing-spot on the mainland for the Norse Earls of Orkney—was, so to speak, an international ferry. According to a remote tradition it was in striving to reach this spot that the Picts were lost in the Pentland Firth, after having been first driven to the Orkneys by the victorious Scots, and then back again by the Orcadians; whence arose the name itself—Pictland or Pentland Firth. But two historical happenings of a much wider appeal may be mentioned; and for appropriate quotations reference has been made to that admirable *History of Caithness* by Calder (first published, 1861).

The first throws a certain very interesting light on what might be called the brighter side of soldiering under Cromwell, or, to quote Calder, 'Cromwell's soldiers are represented in history as rigid sectaries of the most austere cast, to whom everything in the shape of amusement, and especially on the Lord's day, was a

heinous sin and an abomination, but it would seem that such of them at least as came to John o' Groat's were not so very strict.'

He arrives at this conclusion after quoting some entries from the old session record of Canisbay, which would point to an occupation by Cromwellian troops on three separate occasions. The first on 29th March 1652: 'No session holden by reason the Inglishe were quartered in the bounds; the congregation was few in number, and ther was not a sederunt of elders, nather was ther any delinquents.' Again on 2nd May 1652: 'Ther not being a sederunt, by reason of a party of Englishe horsemen being in our fields, whilk made the congregation fewer in number, and severall of the elders to be absent.' And finally, that which gives to so much reading between the lines, on 30th December 1655: 'Adam Seaton convict of drinking on the Sabbath, and having masking plays in his house for the Inglishe men, he was ordained to make publick confession of his fault next Sabbath.'

The second instance, which will appeal to students of Scottish history, and perhaps particularly to sympathisers, poetic or otherwise, with the Jacobite cause, has to do with the gallant Montrose. When he crossed over from Orkney with a body of men, it was in the vicinity of John o' Groat's that he landed on that last fateful attempt of his to win a throne for a Stuart. Three flags he unfurled—two for the king, and one of his own, with the motto which so significantly sums up the character of the man—'*Nil Medium*.' Or, to translate it into his own quatrain:

He either fears his fate too much,
Or his deserts are small,
That dares not put it to the touch
To gain or lose it all.

Montrose lost it all at Carbisdale in the spring of 1650, and fled the stricken field, only to meet his end at the hands of his enemies at the Cross in the High Street of Edinburgh, in a manner surely brutal and heathenish enough to accord ill with their sauctimonious professions.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER III.—continued.

WHEN the party met in the smoking-room that night after dinner two very weary men occupied the deepest arm-chairs. Lamancha was struggling with sleep; Palliser-Yeates was limp with fatigue, far too weary to be sleepy. 'I've had the devil of a day,' said the latter. 'Wattie took me at a racing gallop about thirty miles over bogs and crags. Lord! I'm stiff and footsore. I believe I crawled more than ten miles, and I've no skin left on my knees. But we spied the deuce of a lot of ground, and

I see my way to the rudiments of a plan. You start off, Charles, while I collect my thoughts.'

But Lamancha was supine. 'I'm too drunk with sleep to talk,' he said. 'I prospected all the south side of Haripol—all this side of the Reascuill, you know. I got a good spy from Sgurr Mór, and I tried to get up Sgurr Dearg, but stuck on the rocks. That's a fearsome mountain, if you like. Didn't see a blessed soul all day—no rifles out—but I heard a shot from the Machray ground. I got my glasses on to

several fair beasts. It struck me that the best plan would be to try the corrie between Sgurr Mór and Sgurr Dearg—there's a beallach at the head to get a stag through, and the place is rather tucked away from the rest of the forest. That's as far as I've got at present. I want to sleep.'

Palliser-Yeates was in a very different mood. With an ordnance map spread out on his knees he expounded the result of his researches, waving his pipe excitedly. 'It's a stiff problem, but there's just the ghost of a chance. Wattie admitted that on the way home. Look here, you fellows—Glenraden is divided, like Gaul, into three parts. There's the Home beat—all the low ground of the Raden glen, and the little hills behind the house. Then there's the Carnbeg beat to the east, which is the best, I fancy—very rough going, not very high, and with peat roads and tracks where you could shift a beast. Last, there's Carnmore, miles from anywhere, with all the highest tops, and as steep as Torridon. It would be the devil of a business, if I got a stag there, to move it. Wattie and I went round the whole marches, mostly on our bellies. No, we weren't seen—Wattie took care of that. What a noble *shikari* the old chap is!'

'Well, what's your conclusion?' Leithen asked.

Palliser-Yeates shook his head. 'That's just where I'm stumped. Try to put yourself in old Raden's place. He has only one stalker and two gillies for the whole forest, for he's very short-handed, and, as a matter of fact, he stalks his beasts himself. He'll consider where John Macnab is likeliest to have his try, and he'll naturally decide on the Carnmore beat, for that's by far the most secluded. You may take it from me that he has only enough men to watch one beat properly. But he'll reflect that John Macnab has to get his stag away, and he'll wonder how he'll manage it on Carnmore, for there's only one bad track up from Inverlarrig. Therefore he'll conjecture that John Macnab may be more likely to try Carnbeg, though it's a bit more public. . . . You see, his decision isn't any easier than mine. . . . On the whole I'm inclined to think he'll plump for Carnmore, for he must regard John Macnab as a fairly desperate fellow, who will aim first at killing his stag in peace, and will trust to Providence for the rest. So at the moment I favour Carnbeg.'

Leithen wrinkled his brow. 'There are three of us,' he said. 'That gives us a chance of a little finesse. What about letting Charles or me make a demonstration against Carnmore, while you wait at Carnbeg?'

'Good idea! I thought of that too.'

'You'd better assume Colonel Raden to be in very full possession of his wits,' Leithen continued. 'The single bluff won't do—he'll see through it. He'll think that John Macnab

is the same wary kind of old bird as himself. I found out in the War that it didn't do to underrate your opponent's brains. He's pretty certain to expect a feint, and not to be taken in. I'm for the double bluff.'

'Meaning?'

'Meaning that you feint in one place, so that your opponent believes it to be a feint, and pays no attention, and then you sail in and get to work in that very place.'

Palliser-Yeates whistled. 'That wants thinking over. . . . How about yourself?'

'I've studied the river, and you never in your life saw such a hopeless proposition. All the good pools are as open as the Serpentine. Wattie stated the odds correctly.'

'Nothing doing there?'

'Nothing, unless I take steps to shorten the odds. So I've taken in a partner.'

The others stared, and even Lamancha woke up.

'Yes. I interviewed him in the stable before dinner. It's the little ragamuffin who sells fish—Fish Benjie is the name he goes by. Archie, I hope you don't mind, but I told him to resume his morning visits. They're my best chance for consultations.'

'You're takin' a pretty big risk, Ned,' said his host. 'D'you mean to say you've let that boy into the secret?'

'I've told him everything. It was the only way, for he had begun to suspect. I admit it's a gamble, but I believe I can trust the child. I think I know a sportsman when I see him.'

Archie still shook his head. 'There's something else I may as well tell you. I met one of the Raden girls to-day—the younger; she was on the bank when I fell into the Larrig. She asked me point blank if I knew anybody called John Macnab.'

Lamancha was wide awake. 'What did you say?' he asked sharply.

'Oh, lied, of course. Said I supposed she meant the distiller. Then she told me the whole story—said she had written the letter her father signed. She's mad keen to win the extra fifty quid, for it means a hunter for her this winter down in Warwickshire. Yes, and she asked me to help. I talked a lot of rot about my game leg and that sort of thing, but I sort of promised to go and lunch at Glenraden the day after to-morrow.'

'That's impossible,' said Lamancha.

'I know it is, but there's only one way out of it. I've got to have smallpox again.'

'You've got to go to bed and stay there for a month,' said Palliser-Yeates severely. 'Now, look here, Archie. We simply can't have you getting mixed up with the enemy, especially the enemy women. You're much too susceptible, and far too great an ass.'

'Of course not,' said Sir Archie, with a touch of protest in his voice. 'I see that well enough,

but it's a black look-out for me. I wish to Heaven you fellows had chosen to take your cure somewhere else. I'm simply wreckin' all my political career. I had a letter from my agent to-night, and I should be tourin' the constituency instead of playin' the goat here. All I've got to say is that you've a dashed lot more than old Raden against you. You've got that girl, crazy about her hunter, and any one can see that she's as clever as paint.'

But the laird of Crask was not thinking of Miss Janet Raden's wits as he went meditatively to bed. He was wondering why her eyes were so blue, and as he ascended the stairs he thought he had discovered the reason. Her hair was spun-gold, but she had dark eyelashes.

CHAPTER IV.—FISH BENJIE.

ON the roads of the north of Scotland, any time after the last snow-wreaths have melted behind the dikes, you will meet a peculiar kind of tinkler. They are not the copper-nosed scarecrows of the Lowlands, sullen and cringing, attended by sad infants in ramshackle perambulators. Nor are they in any sense gypsies, for they have not the Romany speech or colouring. They travel the roads with an establishment, usually a covered cart and one or more lean horses, and you may find their encampments any day by any burnside. Of a rainy night you can see their queer little tents, shaped like a segment of a sausage, with a fire hissing at the door, and the horses cropping the roadside grass; of a fine morning the women will be washing their duds on the loch shore, and their young fighting like ferrets among the shingle. You will meet with them in the backstreets of the little towns, and at the back-doors of wayside inns, but mostly in sheltered hollows of the moor, or green nooks among the birches, for they are artists in choosing camping-grounds. They are children of Esau, who combine a dozen crafts—tinkering, fish-hawking, besom-making, and the like—with their natural trades of horse-couping and poaching. At once brazen and obsequious, they beg rather as an art than a necessity; they will whine to a keeper with pockets full of pheasants' eggs, and seek permission to camp from a laird with a melting tale of hardships, while one of his salmon lies hidden in the bracken on their cart floor. The men are an upstanding race, keen-eyed, resourceful, with humour in their cunning; the women, till the life bears too hardly on them, are handsome and soft-spoken; and the children are healthy as trout, and burned and weathered like imps of the desert. Their speech is neither Lowland nor Highland, but a sing-song Scots of their own; and if they show the Celt in their secret ways, there is a hint of Norse blood in the tawny hair and blue eyes so common among them.

Ebenezer Bogle was born into the life, and for fifty-five years travelled the roads from the Reay country to the Mearns, and from John o' Groat's to the sea-lochs of Appin. Sickness overtook him one October when camped in the Black Isle, and, feeling the hand of death on him, he sent for two people. One was the nearest Free Kirk minister—for Ebenezer was theologically of the old school; the other was a banker from Muirtown. What he said to the minister I do not know; but what the banker said to him may be gathered from the fact that he informed his wife before he died that in the Muirtown bank there lay to his credit a sum of nearly three thousand pounds. Ebenezer had been a sober and careful man, and a genius at horse-couping. He had bought the little rough shelties of the North and the Isles, and sold them at Lowland fairs; he had dabbled in black cattle; he had done a big trade in sheep-skins when a snowstorm decimated the Sutherland flocks; and he had engaged, perhaps, in less reputable ventures, which might be forbidden by the law of the land, but were not contrary, so he believed, to the Bible. Year by year his bank balance had mounted, for he spent little, and now he had a fortune to bequeath. He made no will; all went to his wife, with the understanding that it would be kept intact for his son; and in this confidence Ebenezer closed his eyes.

The wife did not change her habit of life. The son Benjamin accompanied her as before in the long rounds between May and October, and in the winter abode in the fishing quarter of Muirtown, and intermittently attended school. Presently his mother took a second husband, a Catholic Macdonald from the West, for the road is a cheerless occupation for a lone woman. Her new man was a merry soul—very little like the provident Ebenezer—much addicted to the bottle, and a lover of all things but legitimate trade. But he respected the dead man's wishes, and made no attempt to touch the hoard in the Muirtown bank; he was kind, too, to the boy, and taught him many things that are not provided for in the educational system of Scotland. From him Benjie learned how to take a nesting grouse, how to snare a dozen things, from hares to roebuck, how to sniggle salmon in the clear pools, and how to poach a hind when the deer came down in hard weather to the meadows. He learned how to tell the hour by the sun and to find his way by the stars, and what weather was foretold by the starlings packing at night-fall, or crows sitting with their backs to the wind, or a badger coming home after daylight. The boy knew how to make cunning whistles from ash and rowan with which to imitate a snipe's bleat, or the call of an otter, and he knew how at all times and in all weathers to fend for himself and find food and shelter. A tough little nomad he became under this tutelage, knowing

no boys' games, with scarcely an acquaintance of his age, but able to deal on equal terms with every fisherman, gillie and tinkler north of the Highland line.

It chanced that in the spring of this year Mrs Bogle had fallen ill for the first time in her life. It was influenza, and, being neglected, was followed by pneumonia, so that when May came she was in no condition to take the road. By ill luck her husband had been involved in a drunken row, when he had assaulted two of his companions with such violence and success that he was sent for six months to prison. In these circumstances there was nothing for it but that Benjie should set out alone with the cart, and it is a proof of the stoutheartedness of the family tradition that his mother never questioned the propriety of this arrangement. He departed with her blessing, and weekly despatched to her a much-blotted scrawl describing his doings. There was something of his father's hard fibre in the child, for he was a keen bargainer and as wary as a fox against cajolery. He met friends of his family who let him camp beside them, and with their young he did battle, when they

dared to threaten his dignity. Benjie fought in no orthodox way, but like a weasel, using every weapon of tooth and claw. In his sobbing furies he was unconquerable, and was soon left in peace. Presently he found that he preferred to camp alone, and with his old cart and horse he made his way up and down the long glens of the West to the Larrig. There, he remembered, the fish trade had been profitable in past years, so he sat himself down by the roadside to act as middleman between the fishing-cobles of Inverlarrig and the kitchens of the shooting lodges. It would be untrue to say that this was his only means of livelihood, and I fear that the contents of Benjie's pot, as it bubbled of an evening in the Wood of Larrigmore, would not have borne inspection by any keeper who chanced to pass. The weekly scrawls went regularly to his now convalescent mother, and once a parcel arrived for him at the Inverlarrig post-office, containing a gigantic new shirt, which he used as a blanket. For the rest he lived as Robinson Crusoe lived, on the countryside around him, seeking and receiving no news of the outer world.

(Continued on page 102.)

THE 'APOSTLE OF THE COCONUT.'

By THOMAS J. McMAHON, F.R.G.S.

I.

THE wonderful properties of the coconut are proverbial. Natives of the South Sea Islands are known to subsist almost entirely on its flesh and milk. In German New Guinea, now administered by Australia under the powers of a mandate, there recently died an educated European—an Austrian—who declared that the coconut is the proper and only food of man, and spent the last twenty years of his life in an endeavour to convert the world to this belief.

A very charming and interesting character was Auguste Engelhardt, the 'Apostle of the Coconut.' This remarkable man lived on his own beautiful little tropic isle of Kabakon, one of the Duke of York group of German New Guinea.

The 'Apostle' propounded the new and weird doctrine that living on the coconut as food, and coconut milk as drink, was the one and only possible road that led to the sure calming of the nerves, the certain curing of all diseases, especially of the mind, and the banishment of all the evil passions from the heart of mankind. He persisted that the coconut was the rational diet of man, as research, he maintained, proved it to have been the original food of man, the daily menu of Adam and Eve.

Auguste Engelhardt would tell you that a coconut diet would most effectually drive out from the heart of man all vile ambitions, those

particularly that led to strife, argument, and devastating war. Prior to the late war the 'Apostle' had many hundreds of disciples in many countries of the world. In America he had over four hundred, with whom he maintained a regular correspondence. For the benefit of his disciples he published in America an attractively got-up little monthly journal, entitled the *Naturopath*, where he expounded his strange doctrine.

On his little island, his kingdom, for he ruled supreme, he was the merriest and kindest of men; in short, a most attractive person, a gentleman to the tips of his long, elegant fingers. As a host he was perfectly charming. He was so earnest in his teachings, so full of detail in his explanations—with every argument that he offered he had a hundred incidents or facts to support it—one almost became convinced and converted under his gentle and persuasive appeals to give his 'noble' teachings a trial. He would say to you, 'Tell me what you eat, and I will tell you what you are,' a strange, uncanny method of reading character. The 'Apostle' maintained that 'it is what you eat that makes you either happy or sad, God-like or human, good or bad.' His doctrine was, the human passions were devils stowed away in the system, to come into action, or remain quiescent, according to the class of food eaten. Meat foods, he maintained, fired the blood, while vegetable and other foods are usually so

unnaturally cooked and dished that they are responsible for the many unsatisfactory defects of the character and habits of man.

The 'Apostle' called himself a 'Naturopath,' one who directs the way in the matter of foods so as to acquire a care-free future, a healthy state of nerves, a clear brain, and a mind above the distress of death. This almost spiritual state could be brought about by a diet of coconut; indeed, he characterised the coconut as the most 'spiritualising of edibles.'

II.

Kabakon, where lived the 'Apostle' in a simple, sublime, and un sinful life, in happiness and contentment, is a coral isle some five miles in circumference, luxuriantly covered with thousands of coconut palms. It is in the midst of a garden of delightful isles, surmounted by the most clear and sparkling of tropic waters, in the depths of which one can see the wonders of coral-land, every shade of pink, red, green, and gold, mingling with the marine vegetation, delightful beyond description, through which dart fish of the most gorgeous colours. Here on this beautiful isle, in the shade of giant oaks with great spreading branches intertwining, for all the world like pictures of the Druid groves of ancient Britain, with the music of the rustling palms mingling with the deeper notes of the waves upon the coral shores, lived in perfect peace the 'Apostle.' The isle is a scene of perpetual spring, and in this nature's garden the 'Apostle' had his home, his great library, and his playground, about which he roamed, like the natives that attended him, merely in a *lava-lava* or loin-cloth, bare-headed, and bare-footed. On festive occasions, such as the visits of friends or tourists, this dress was augmented by a wristlet watch and a walking-stick.

Engelhardt was a student of Wurtemberg. He was a singularly handsome man. What his age was it was hard to guess; he might have been thirty-five, but must have been much more. He had long golden hair, well groomed. His face and body, from constant exposure to the sun and open air—for, being a sun-worshipper, he was never indoors—were almost black. Every morning at six, as the sun rose, and every evening at six, as the sun set, he took a bath, and then his native servant would massage his body, and brush his hair, until he shone with health and cleanliness. He never suffered from malaria, or any other tropical fever, but his death was due to a tropic cancer, from a scratch on the right ankle.

Though he never spoke of his early life or student days, he never contradicted a report of a duel with a fellow-student, and a love affair with a lovely Austrian countess. It was hinted pretty freely (but the 'Apostle' steadfastly declined to answer any inquiries) that he was concerned in the tragedy of the Crown Prince

Rudolf of Austria. There was no doubt some incident had happened in his early life which compelled him to fly from his native land, and so he went to German New Guinea, and to his beautiful isle of Kabakon, seeking whatever peace, comfort, and happiness life could yet allow him. He found all three in the doctrine of the coconut, and his strict attention to a coconut diet.

III.

Engelhardt spoke English not only fluently, but with a style that denoted the ardent student of Shakespeare, which, indeed, he was. He possessed a most cultured voice, and his gestures were those of the most graceful actor. His library was admittedly one of the largest and most varied of the Southern Hemisphere. He spoke four languages—German, French, Italian, and English—and he had innumerable books and magazines of these nations.

His sleeping apartment was a thatched native hut, without furniture. In the centre of the hut was his bed—of nothing but clean, dry sand—with four bed-posts to carry a curtain to keep away the irritating mosquitoes. He never used either pillow or rug, but covered himself with palm leaves on the cool evenings. He went to bed punctually at nine every night, but rose at three, and read and studied until daylight. While living in this simple style himself, he maintained a sumptuously furnished mansion for his guests. These he treated to much comfort, and had every food luxury that wealth could procure, for he was a very wealthy man, his coconut plantations bringing him in thousands of pounds yearly. Every room of this mansion, a great wooden building of ten rooms, had the walls most beautifully painted with scenes of Austria. To carry out this work he had an artist brought from Austria, to whom he paid a lordly sum.

Engelhardt would never attempt to force his doctrine upon anyone, not even his native servants, though they ate great quantities of coconut. If they wanted *bullamacow* (tinned meats) he would readily provide that food. He greeted guests by offering wines, but would be delighted if they accepted the milk from a freshly cut coconut, under all circumstances a most refreshing drink. He was willing to admit it took time, patience, and a trial of the digestive organs to acquire the coconut diet. But persistence in cultivating the diet was, after all, but acquiring restraint on one's appetite, and this was leading to the better and more spiritual life. The habit of coconut diet once acquired, there was a prompt response in healthfulness, and even joyousness, and a remarkable clearness of the brain. The health of brain brought health of body; under such conditions life could be nothing but contentment and happiness.

A rather interesting item of the diet was a number of recipes held by the 'Apostle' for

making dishes out of coconut. There were no fewer than twenty different salads, many of which could be eaten with relish by any one. The greatest delicacy the 'Apostle' could offer a guest, one which any guest could thoroughly enjoy, was a salad made from the heart of a coconut palm. This was a very costly dish, as it meant the destruction of a coconut palm, every palm on Kabakon being worth seventy pounds.

To the last of his days the 'Apostle' per-

sisted in his coconut diet, but these days were saddened by the fact that the War destroyed his influence among many of his disciples. His magazine had long ceased, his correspondence had dwindled to very few letters, and many of his friends, British as well as Germans, had either died or left German New Guinea. Sad at heart, he was to the last, however, as brave as ever in defending his doctrine of the coconut, the 'spiritual' food to make men god-like.

PETER WAS SINGLE.

PART II.

v.

PETER was very favourably impressed with his 'staff.' They were, without exception, decently dressed, well-educated girls, and they were very anxious to put the new assistant-manager at his ease and make him feel completely at home. Peter decided that the oldest was not more than twenty-five, while the youngest must have been under seventeen, a pretty little girl who fell in love with him then and there, frantically and obviously.

'Very decent lot,' said Mr Sadler, when the last introduction had been made. 'I don't approve of women in warehouses myself, but I shall miss these people just the same. I wonder if Miss Slade is turning in to-day?'

'Who is Miss Slade?' asked Peter curiously, but even as he spoke he felt quite sure that he knew who Miss Slade was.

'Oh, Miss Slade is a fine girl,' said Mr Sadler warmly. 'She—she—well, I've never met a girl like her. Only, she's had a lot of time off lately—ill, you know. She looks after the special orders, and it's very trying work. I don't mind admitting to you that it would take a really smart man to do her work. She's one of those girls that other girls like; the staff think the world of her. So did the firm at one time, before she started being ill and letting her work get behind—they don't believe she is ill really, you know, because she always looks so remarkably well, and because she's always so cheerful—' He broke off in some confusion as Mr Reginald appeared suddenly from behind a fixture.

Mr Reginald came towards the two young men with his hands clasped behind him, and a suspicious light in his eyes. 'Have you been giving Golding an idea of your duties, Sadler?'

'Yes, Mr Reginald.'

Mr Reginald nodded. 'Better take full advantage of Sadler's knowledge, Golding,' he observed grimly. 'He leaves us at the weekend, and then you'll have to stand on your own feet.—Miss Slade come?'

'No, Mr Reginald.'

Mr Reginald frowned. 'Where's Hughes?'

At this moment Mr Hughes was observed scuttling hurriedly down the narrow passage towards them. Peter had a curious feeling that the manager was possessed of some extra sense which warned him immediately he incurred the displeasure of Mr Reginald. Surely no autocrat since first the world began was ever feared as Mr Reginald was feared by this man, who visibly and violently trembled at the most casual mention of that dread name. Apprehension and fear showed in every line of the manager's putty face, and in every movement of his lumpy figure, as he shambled fussily up to them.

'Where have you been until now, Hughes? What have you been doing all this time? It's nine o'clock practically, and half the staff standing aimlessly about. This will have to stop, Hughes. You hear me? This will have to stop!' Mr Reginald's voice was harsh and menacing, but his eyes, fixed unblinkingly on the face of the unfortunate Hughes, had a peculiar gloating light in them. Quite obviously Mr Reginald gloried in his power, and took full advantage of it on every possible occasion. He considered that the more closely his unhappy manager resembled a jelly-fish, the better it was for business, for Hughes was of that invertebrate type which is quite incapable of asserting authority until his own position is threatened. Mr Reginald was not a bully from choice; he was merely a perfect business man whose religion was profits. To gain his ends, Mr Reginald was just as ready to fawn as to bully. Peter, pink with shame that a man many years his senior, and occupying a position of responsibility, should be spoken to in such a way in the presence of girls young enough to be his daughters, felt an unaccustomed longing to do something extremely violent—in short, to kick Mr Reginald hard and often.

vi

'If that's the way he speaks to the manager, what happens when the under-manager annoys him?' Peter asked of Mr Sadler later in the day.

'That depends on the under-manager,' explained Mr Sadler, looking up from a pile of complaints with a harassed air. 'If you take his bullying quietly, and work hard, he'll let you down light, and you'll keep the job; but if you show fight, you'll have to go. Mr Reginald will not tolerate any male employee who has enough courage to call his soul his own. He's not such a bad sort really, but he's discovered that men in a permanent state of apprehension work harder than men who feel secure. Consequently he makes a regular practice of black-guarding you in front of every one about once or twice a month, whether you deserve it or not. There's no personal feeling in it really; it's just part of the system, you know.'

'There's one thing,' observed Peter with gloomy satisfaction—'I'm not married.'

'Me neither, thank goodness!' answered the other.

Both young men sighed.

The following morning Peter made the acquaintance of Miss Slade, and for some strange reason, for which he did not attempt to account, felt highly elated when this particular member of his staff proved to be none other than the girl he had met leaving the building on the occasion of his first visit. Miss Slade was a fine rosy-cheeked girl, with a pleasant mouth but curiously sad eyes. She was quite as tall as Peter, and much straighter, and appeared so well and cheerful that it was difficult to imagine what strange sickness could be serious enough to keep such an obviously purposeful girl away from her work, and yet leave so little trace on her outward appearance.

'I have seen you before, I think, Mr Golding,' said the girl in a low, quiet voice. 'You were coming in—'

Peter nodded. 'Yes, and you were going out. I—I didn't know you were ill. I hope you are better.'

The expression of pain which flitted across the girl's face both hurt and surprised him.

VII.

Although Peter worked like a slave, he had too much of his vagabond artist father in him to make a successful under-manager. In the running of a department there were so many details which, although of paramount importance, were so dull and uninteresting that they refused to remain long behind Peter's dreaming eyes, and he made many blunders which, to the trained warehouseman, seemed childish and inexcusable. On the other hand, Peter had ideas which the shrewd Mr Reginald was quick to appreciate. During the first week of his reign he suggested to Mr Hughes a new system of packing, which not only had the merit of simplifying the work, but also saved many hours of work in the course of a week, and earned the manager's undying admiration. His

system of fixture-head ticketing also facilitated the work of the department considerably. All the same, Peter was not a success.

The huge machine, of which he had lately become a more or less important cog, shaped and moulded him, by a process which was both rapid and painful, to meet its requirements up to a certain point, but beyond this point his imagination made further progress impossible. Yet, even though Peter was not a successful under-manager, his energy and readiness to tackle anything and everything which came to hand made him a very useful young man to have about.

At the conclusion of his first week, Peter had two interviews with his superiors. The first, with Mr Hughes, was both instructive and entertaining. The second, with Mr Reginald, was instructive only. Mr Hughes attracted Peter's attention by the simple process of crooking his finger at him and winking mysteriously; he then led the way to a quiet corner of the warehouse.

'Want me, Mr Hughes?' asked Peter, coming up behind.

'Ye—s,' answered the manager, turning but not facing him. 'It's like this. I thought I'd better give you a bit of advice which will come in handy when Mr Sadler's gone. For one thing, you're too friendly with the girls—it doesn't do to be too friendly with girls. They take advantage, see? Besides, you can't tell 'em off the same when you're friendly with 'em—all except Miss Brown, and that's only because she comes in handy for telling things about the others. It's always very handy to have some one like Miss Brown about.'

'I don't care very much for Miss Brown myself,' said Peter in a clear voice.

'She's very handy,' repeated Mr Hughes, his eyes wandering shiftily. 'You want to look after her—give her the easiest orders, and cover up her mistakes a little.'

Later in the day Mr Reginald sent for Peter, and when the latter entered the private office he was immediately invited to take a seat, which, had he but known it, was a very special favour.

'You know, Golding,' Mr Reginald began, with an edge to his voice, 'I can't make you out at all. You are certainly possessed of more than average brains, you're energetic, and obviously doing your best to please, but somehow—'

'I know what you mean exactly,' interrupted Peter brightly, 'and you're quite right. I've been like that all my life.'

'Well, you'd better stop being like that if you intend to remain here,' observed Mr Reginald, the edge of his voice becoming more pronounced. 'I've no doubt that you present a very interesting psychological study, but I'm not in business to study psychology for its own sake. Now, there's another thing: you are far

too friendly with those girls. You'll have to harden yourself; to be quite frank, you'll have to learn to bully 'em occasionally. Make no mistake, I sha'n't hesitate to bully you if things go wrong.'

'There's no need for bullying,' said Peter; 'they're good conscientious workers—educated people who know the difference between right and wrong.'

Mr Reginald smiled mirthlessly. 'The woman who knows the difference between right and wrong has yet to be born, and the woman who can resist the temptation to take advantage of an indulgent husband or an easy-going boss never lived. I want to see you pick on the first sign of slackness, or the first mistake that's made, and turn the department inside out for a few minutes. No swearing at 'em, mind you. I won't tolerate bad language.'

Peter blushed to the roots of his hair. 'I'd never dream of such a thing,' he exclaimed with horror.

'I'm glad to hear it,' answered Mr Reginald. 'Women know they haven't much to fear from a swearing man, and you'll have to show them that you mean to be respected. Of course they'll shed tears, but they'll think all the more of you—women really enjoy being bullied, you know—and weeping.'

VIII.

Peter left the private office with a dull flush of resentment under his eyes. 'The business-like brute,' thought Peter. 'He never bullies the girls himself, but he doesn't hesitate to bully us into bullying 'em—I'll see him fried on both sides first. Thank goodness, I've no wife depending on me!'

Nevertheless, as time went on and the strangeness of his position wore off, Peter was bound to admit that, up to a point, Mr Reginald was right. Certain of the girls did show a disposition to take advantage of his leniency. A faint but very definite suggestion of slackness began to creep into the work of his department, which Peter tried to rectify by working the harder himself; but the slackness only became more pronounced. It was at times such as these that Peter sought the assistance of Miss Slade. The two had become firm friends, and Peter was apt to lean on her superior business acumen rather too heavily for his own good, which troubled the girl greatly. She did her best to make him stand more firmly on his own feet, but there were certain phases of warehouse work which Peter seemed quite unable to grasp, and on at least two occasions disaster had been averted only by the narrowest margin.

Helen Slade understood Peter Golding. She saw the artist and dreamer, and read in his shy dark eyes all the gentle courage and all the wistful kindness of his boy's heart. Peter was of an infinitely higher type than Mr Reginald.

He had the humility of the philosopher and the vision of the artist; for himself he asked but little of life—the right to serve his friends and accept the smile of understanding as good and sufficient reward.

Towards the end of Peter's second week at Clawson's, Miss Slade and he met in the narrow street which runs the full length of the warehouse. The meeting occurred at fifteen minutes past eight o'clock on a cold bright morning. Peter had just squared his shoulders with the idea of counter-balancing somewhat that sinking feeling with which approach to his daily toil invariably oppressed him. Miss Slade, who had not yet observed him, was on the opposite pavement. He noticed wistfully how well the girl looked, and how proudly she carried herself. She had the bright eyes and heightened colour of one who has just travelled in the open at a great pace. 'Some fellow has brought her along in his car,' he thought with a sudden pang. For young ladies employed at Clawson's to arrive splendidly (if somewhat self-consciously) in automobiles owned and driven by affluent male friends was by no means an unusual occurrence. 'She's sure to know lots of fellows who own cars—lucky brutes!' At this moment the girl turned slightly and their eyes met. Blushing deeply, Peter raised his hat. Peter was on the warehouse side of the street, and without the least hesitation Miss Slade crossed over to his side. That was one of her traits which compelled Peter's admiration—the frankness of her friendship. Modest, and quite as shy as himself in some respects, she made no attempt to disguise her partiality. Helen Slade was incapable of simpering; her voice was clear and steady, her gaze fearless and friendly.

'Good morning, Mr Golding,' she greeted him with slightly heightened colour. 'Isn't it glorious for walking? It seems a shame to go indoors. How I would like to keep on walking and walking!'

Peter nodded. 'It's a shame that you can't,' he answered almost savagely. 'It isn't right that girls should have to work in dusty warehouses.'

Miss Slade laughed and then sighed.

'I don't mind the warehouse so much really, if it wasn't for——' She broke off in some confusion, and then began again: 'I think it's a matter of temperament. I am quite sure that you find the warehouse far more irksome than I do; you—you do not seem cut out for warehouse work.'

'I'm beginning to think I'm not cut for any sort of useful work,' answered Peter pessimistically. 'I expect I'm a bit of a thick-head, really.'

'Oh, please don't misunderstand me,' she said quickly. 'I only meant that——'

'Quite—oh quite,' interrupted Peter, anxious only to save her from embarrassment. 'I know what you mean, but all the same. . . .'

Peter's pause lasted until they reached the entrance of the building. Several other early arrivals, male employees belonging to other departments, were loitering in the doorway, smoking and reading the sporting columns of the various dailies, determined not to start work a moment earlier than was absolutely necessary. Some of the loiterers smiled knowingly as the pair passed them; others did not glance up from their papers; but all wished Miss Slade and her escort a mechanical good morning.

'You know,' said Peter, as they began to ascend the stone steps (there was no lift at the employees' entrance), 'warehouse work really does seem to suit you. You seem to have a sort of an instinct for it, and although you've worked overtime every day this week you look fit and well as——.' He was interrupted by a harsh little cry from his companion, an exclamation that was at once a cry of despair and a pitiful protest. He half turned and looked at her in amazement. Helen Slade had gone white to the lips.

IX.

The first thing Peter did on the following Monday morning was to call the staff together and inform them that all was not well with the department; that not only was work getting behind, but serious mistakes, due to carelessness for the most part, were becoming more frequent every day; a deplorable state of affairs which would have to cease immediately, or—or—well, anyhow it would have to cease. In spite of the fact that Peter's voice was uneven and a little gaspy, there was a determined look about his mouth and chin which greatly impressed the staff. He concluded by saying that he hated to have to say such things to them, but pointed out that matters were most obviously not as they should be. He hoped that the staff would put its back into the job of removing all cause for complaint, and that they would not think he was grumbling or anything of that sort.

The staff liked Peter, and it is quite possible that one or two were a little conscience-stricken. They assured him of their hearty co-operation, and from that moment work in the hosiery department went with a swing which caused Mr Hughes to rub his eyes and stare. Then he went down into the private office and shortly reappeared with Mr Reginald, who beamed on Peter in a friendly fashion and went away, nodding his head wisely.

'The question is,' reflected Peter, 'how long is it going to last? How long can they keep up this pace?' He knew in his heart of hearts that girls ought not to be expected to work at such a speed for long, and an attempt to do so would probably result in infinite harm to themselves.

On Tuesday morning Mr Hughes called Peter

to his desk and informed him that the number of orders executed on Monday had broken all previous records for the department, and predicted that, as a consequence, THE FIRM would be in an exceptionally good humour. Mr Hughes was so elated that he almost looked Peter straight in the eyes. Peter, too, forgot his misgivings long enough to feel rather pleased with himself as he passed on the information to Miss Slade.

The girl congratulated him gravely, but looked troubled. 'They will expect you to keep it up,' she said quickly.

'That's impossible,' Peter answered promptly. 'They can't break records every day without breaking something more important. The great thing is that I've found a better method of keeping up a good standard than by constant bullying. Human beings are pretty reasonable if you treat them as reasonable human beings. I'm beginning to feel more sure of myself, you know—confident and all the rest of it. Do—do you know what I should like to do to celebrate that broken record?'

Miss Slade shook her head without looking at him. Peter was glad of this, for he felt quite sure that if she once looked at him, he would never have the courage to continue. He glanced cautiously round to make quite sure there was no one in their immediate vicinity, and then said in a hoarse whisper, 'I would like you and me to—to spend an evening together—g-go to some place of amusement, you know; er—will you?'

She looked up at him with her frank, sad smile. 'I should like to very much indeed.'

Peter, greatly relieved, breathed heavily. 'Then shall we say—Friday?' he asked eagerly.

'No! No! not Friday! not Friday!' she answered in a low, vehement voice. 'Let it be to-morrow or Thursday—yes, Thursday—please say Thursday!' She looked at him appealingly, and with that look half admitted her secret.

'Why, certainly,' he stammered; 'Thursday by all means—it's awfully good of you to come at all.' His heart was singing 'she cares! she cares!—she cares a little anyhow—she told me so—she *looked* it. To think that such a wonderful girl should care even a little for a clumsy, blundering creature like me.'

For the rest of the day the under-manager worked like ten men; he felt that he had something to work for now, and he was grimly determined to make a success of his job. It never once occurred to him that there might be a special significance in Miss Slade's desire to accompany him on any evening except Friday. He considered that the strangeness of her manner was sufficiently accounted for by the disturbing effect of the silent avowal which had passed between them.

(Continued on page 107.)

THE ICEBERG PERIL.

By P. T. McGRATH.

I.

TRANSATLANTIC shipping is imperilled by the presence of icebergs in the shipping track. In the path of the greyhounds of the sea, the great, swift-moving steamships, which are carrying almost their maximum of passengers at these seasons, there is one danger which all mariners fear. Captains can take the bridge in the face of a storm, stand for hours upon an icy deck, or be lashed to a stanchion on the bridge, with the feeling that it is but a question of time when the huge boat will cease rolling under the violence of the waters and will be safe. The most severe storms scarcely disturb the gigantic liners which to-day cross the ocean under full steam pressure. There is a greater danger, however,—one so grave and so much feared that some years ago the big companies issued an order changing the route across the Atlantic many miles to the south of the track which had been followed so long.

This is the season of the year when icebergs tear themselves loose from the fields of the frozen north, and are caught by currents and trade winds and sent southward across the track of many passenger ships and freighters. Off the coast of Newfoundland, many a ship has suffered in recent years, with a portion of her bow shattered as a tin cup might be broken against a rock. To the south of this point there is almost the same degree of danger, but the list of accidents is smaller because of the vigilance exercised by the officers of ships which are carrying thousands of lives.

It has been said that old mariners can 'smell' an iceberg ten miles away. This may not be true literally, but it is a fact that the presence of a great mass of ice is noticed through a change in the temperature. The captain, when near iceberg areas, keeps a sharp eye on the thermometer for a sudden fall, and at once slows down if such be noted. Recently an iceberg was reported as having been sighted in a latitude which brought it directly in the path of the Atlantic liners. It was one thousand feet long and one hundred feet in height.

In May and June the limits of the ice-drift may extend as far south on the Atlantic as latitude 39° 30' N. in longitude 42° W., and as far south as latitude 39° N. in longitude 44° W. But it is only in seasons when icebergs are exceptionally large and numerous that they get so far south. During June 1885 bergs were in unusually great numbers, and a few drifted south on the 47th meridian to within forty-five miles of its intersection with the 40th parallel. But after June, owing to the increased

strength of the warm current, the ice limit in this region recedes well to the northward.

The forerunners of the bergs are the melting floes which sweep down from Labrador after the New Year, carrying in their midst, like ships on the ocean, countless towering masses of dazzling purity. As the spring advances they become more numerous, and in the early summer their numbers are largest and they are detached from any ice floe, though they defy the sun until they reach the Gulf Stream. In one week, in April 1903, more than eighty steamers arriving at American ports gave data to the Hydrographic Office of bergs they had seen, and in July one steamer arriving at St John's reported passing 118 of them. Off Belle Isle Strait about the same time nine were counted in a day's run by a little mail boat that plies to Labrador. The larger ones grind along the Newfoundland coast, and melt, topple over, break into several pieces, and float away south, to become a menace to Atlantic liners and to cargo carriers hurrying along the ocean lane.

The Grand Banks is the worst area. There bergs are found enshrouded in the fog that nearly always veils the region through the comingling of the heated Gulf Stream and the frigid Labrador current, and in this murky atmosphere fishing vessels, tramp steamers, and passenger boats alike come upon them with disastrous results. Not a few of the sea's mysteries in the disappearance of big steamers, like the *Naronic*, or the *Huronian*, or of small trawling smacks, are certainly due to this cause, and it is only the special Providence that seems to wait upon sailors which prevents the total of these catastrophes from being far greater.

II.

The year 1923 was almost unexampled in the abundance of these crystal islands, and the early period in the season at which they showed themselves in such numbers. Towards the end of January their advance guard was sighted off the Newfoundland coast, and every week they became larger and more numerous. During March and April these ramparts adrift were a constant menace to the big liners, which, trying to make fast passages, had to risk more chances than mere freighters, so that more than one greyhound came within an ace of meeting her end thereby. As early as 20th March 1908, the steamship *Savoie*, on arriving at New York, reported sighting an icefield 200 miles long floating directly in the path of incoming steamboats.

As an instance of the magnitude of this iceberg peril in recent years there may be mentioned

the case of the *Kaiser Wilhelm II.*, which on 9th April 1911 counted thirty-two large bergs within the range of vision. The *Teutonic* the next day sighted thirty-nine, and the *Caronia* two days later passed forty-six. The *Toronto* in the same week counted seventy-two between sunrise and sunset; the *Majestic* saw fifty-five about the same time; the *Chemnitz* dodged among eighty or more of them; and the *Minneapolis* brought a report of sixty-three.

All these icy masses which infest the North Atlantic steamer-track have their origin in the frigid Greenland fiords, where mighty glaciers, real solid Niagaras, are formed from the vast ice-cap which covers that remote Arctic region and move resistlessly on to the sea, where each summer they 'calve' or give off enormous fragments, which, dividing and sub-dividing again and again and again, become the bergs so much dreaded by the springtime voyager. These northern monarchs are borne down in stately procession from the dreaded Baffin Bay on the Labrador current, which sweeps past the eastern coast of Newfoundland, across the Grand Banks and into the Gulf Stream, where they gradually disappear under the influence of the increasingly powerful rays of a more vertical sun and the higher temperature of the surface water.

The most extraordinary narrative in the annals of absolutely authentic adventure is that of the escape of the crew of the exploring steamer *Polaris*, who, on 15th October 1873, went adrift on a mass of ice, twenty-seven persons in all, in northern Greenland waters, and, after being 195 days on this strange raft, were picked up, safe and unharmed, by the Newfoundland sealing steamer *Tigress*, 30th April 1873, having drifted southward eighteen hundred miles and escaped countless and almost incredible dangers.

During their long journey down past Labrador and Newfoundland the bergs do not remain of the same shape as when first broken off from the parent glacier or sundered again by internal fractures or grounding on reefs, but frequently turn a somersault to accommodate themselves to the changed centre of gravity of the berg. Admiral Markham, in his exploring cruise in Melville Bay, in 1887, counted between seven hundred and eight hundred bergs, all under way for sunnier climes, and some of them exceedingly large. One of them he estimated to have been six hundred feet high and eighteen hundred long. The tallest berg ever reported about the liner track was one observed by the steamship *Mineola* in June 1890, which was seven hundred feet from water-line to summit; while the *Hafis*, in May 1892, sighted one which was over six hundred feet high. Bergs three to four hundred feet high and one thousand to fifteen hundred feet long are by no means uncommon along the Newfoundland coast, but they usually ground on the Grand Banks, are

buffeted by storms, and split themselves into many lesser fragments. These bergs are not dangerous in clear weather, because they can easily be made out when long distances away, and can therefore be avoided; but from April till October the Grand Banks are almost always veiled in fog, and it is then that the menace of these ghostly wanderers most oppresses liner captains and mariners generally. Only the vigilance now enforced prevents terrible disasters, and even as it is many stout cargo boats are sent to the bottom every year from this cause.

The *Arizona*, in 1879, then the queen of the flyers, tore away her bow and came near sinking by striking a large iceberg off Cape Race in November, when most shipmasters thought the ocean was at last free of these pests. But now that the United States Hydrographic Office has taken to recording all the reports about these pallid wayfarers of the waters, it is known that they are to be found there every week of the year. The *Arizona* put into St John's, had her bows rebuilt of wood, and made her way to New York after taking two hundred tons of ice out of her forepeak, where it had forced itself in the collision.

Ten years previously, in August, the steamer *Vicksburg* was sunk by collision with a berg in the same region, when sixty-five persons perished; and in 1863 the *Canadian* was also sent to the bottom, with a loss of forty-five persons. The next July an emigrant vessel from Ireland to Montreal perished there by ramming a berg, and of one hundred and sixty-two persons aboard her only four escaped. Another terrible tragedy occurred in May 1897, when the French fishing schooner *Vaillant* plumped into a frozen wall on the Grand Banks, and seventy perished. Another fishing schooner picked up four survivors out of twelve who got away in two boats. They had barely been able to keep themselves alive, being adrift six days and nights without food or water, and suffering dreadfully from frost-burn because of being unsheltered and only partly clad.

III.

Newfoundland mariners are always on the alert for bergs, because they are never absent from these waters, and even the vigilance and expertness of the hardy fisherfolk do not prevent many a fatality. The barque *Nellie* left St John's one May morning two or three years ago, and before nightfall the two solitary survivors of her crew of ten were taken off a spar by a fishing smack, the vessel and the other eight having gone down through the ship tilting against a berg in a sudden fog. The schooner *Albatross*, with a crew of twenty-two sealmen, was never heard of after she sailed in March 1903, and the general impression is that she struck a berg and went down. In April 1904, the steamer *Grand Lake*, while engaged in the

seal fishery, with two hundred men aboard, rammed a big berg on the Banks and narrowly escaped foundering, getting back to St John's with all her crew busily engaged pumping and bailing her out. A like mishap befell the *Newfoundland*, which was employed in the same hunt in April 1898, and her plight was even worse, for her sides were crushed by a floe as she tried to escape, and she reached port in almost a sinking condition.

Sometimes even the staunch and specially-built vessels engaged in the Newfoundland seal fishery are unable to withstand the contact with floes or bergs, and within the last ten years the *Wolf*, one of the finest of her class afloat; the *Hope*, which had an enviable record in Arctic exploration; the *Mastiff*, which had been built originally by the British Admiralty for northern work; the *Resolute*, a one-time Scottish whaler; and the *Elliot*—all succumbed to the terrible forces which nature exerts in this fashion; and it would require pages to tell of the mishaps to coasting and sailing craft in this region which have come to grief before these ice-monsters.

St John's is the haven of refuge every year for ships disabled by contact with bergs, which have to be docked for repairs to bows or hulls. In July 1897 the *Concordia* put in with her whole bow torn off by a berg, and only her front bulkhead to withstand the strain of forcing two hundred miles through the ocean to reach a shelter. The *Knight Bachelor* was almost an identical case, and the *Hatasu* another. The *John Bright*, the *Addington*, and the *Rotterdam*, to mention only a few, were similarly smitten. All these had to get wooden bows to continue their voyages. What small prospect of escape the crews of such crafts have is proved by the case of the *Castlegate*, which, in March 1893, was crushed and sunk off Newfoundland, her men taking to the floe and being adrift thereon for two days and nights till rescued by the sealer *Diana* at the beginning of a blizzard which they could never have survived, for it battered the ice into chowder and would have overwhelmed them.

Big passenger steamers frequently find themselves in dire peril from bergs, as was the experience of the liner *Normannia*, now the French flyer *L'Aquitaine*, on the Grand Banks on 31st May 1890, when, having threaded her way through a wide array of bergs, she put on speed and was racing ahead till a fog shut down. Then a crystal barrier interposed, upon which she escaped impaling herself only by the prompt working of her twin screws in opposite directions, causing her to spin round on her heel and just graze the berg with her side as she passed it.

The *City of Beril* struck a berg in a fog on the Banks three years later, but fortunately was going at reduced speed, else she would have torn her forepart asunder. Even as it was, her stem was telescoped, her forepart was shattered,

and the falling of a hundred tons of ice about her decks made a wreck of all the gear and fittings from the bowsprit to the foremast. Her sister ship, the *City of Rome*, hit a low-lying berg in September 1900, and knocked off her stem below the water-line, leaving an aperture large enough to admit an automobile. The crash alarmed the passengers, who were at lunch at the time, and a panic-stricken crowd rushed on deck; but there was seen to be no cause for alarm. The Swedish steamer *Nordcap*, with four hundred emigrants, hit a similar berg off Cape Race in May 1901, and sustained such damages that she had to put into St John's to effect repairs. This was also the experience of the French steamer *Burgundia* off St Pierre in March 1903, with one thousand French fishermen aboard, whom she was transporting to that port to engage in the cod fishery, and of whom twelve perished by the dismantling of the fore-castle in which they were lodged.

The *Scale* was another liner that rammed a berg, striking it a glancing blow as she swung round on sighting it; but the pressure of the mighty mass flung her over on her side until it was feared she would sink. Indeed, the coal in her bunkers ran over because of this, and she made port with a heavy list. The *Portia*, when off Newfoundland in 1895, ran near a berg to enable some passengers to 'snapshot' it, but went upon a sunken portion of the ice, disturbed its equilibrium, and was being lifted up out of water by the swaying mass, when her weight broke off the fragment which held her and she sank back in her native element again. The *Caspian*, with five hundred and fifty emigrants aboard, bound for Montreal, near Cape Race in 1891 in a thick fog, drove against a berg and shattered her bow so badly that she was barely able to reach St John's, so fast did the water gain on her pumps. The *Erl King*, in 1892, met a like mishap when entering Belle Isle Strait with seven hundred and twenty emigrants, and had to make this port stern first to relieve the strain on her leaky forward bulkhead. The French liner *Gascogne*, with six hundred aboard, came near being overwhelmed by ice on the Grand Banks in April 1898, having been caught there with a broken shaft, and was in extreme peril for several days, until the floe swept her bodily southward into warmer water and was then dispersed by a stiff breeze, which set her free. The German liner *Bulgaria*, in 1901, was compelled to seek harbour at St John's, with nearly one thousand passengers, having injured her propeller amid the floes.

IV.

Of course the most terrible marine disaster attributable to ice was the loss of the White Star liner *Titanic* on 15th April 1912, though this ship was destroyed by a floe and not by a berg. Through a mistaken idea of the strength

of the ship, Captain Smith, of the *Titanic*, drove her at full speed on her maiden voyage through masses of flat or floe ice on the southern edge of the sailing track, he being ambitious to break all records in trans-Atlantic passages by proceeding on a straight course, instead of skirting it, as other ships did, to escape contact with this floating crystal field. The flinty mass tore open the ship's side along several compartments, she filled with water, and shortly after sank with a loss of 1503 souls. She carried 898 crew and 1308 passengers, or 2206 in all, of whom 703 were saved, 210 crew and 493 passengers. Thanks to wireless telegraphy the Cunard Liner *Carpathia* was summoned, and, reaching the scene next morning, rescued the survivors.

As a means of recording the movements of both ice-fields and bergs, nearly all of them are reported to the United States Hydrographic Office, and are bulletined, with their exact location and size, at the various branches of the office. The *Hydrographic Bulletin*, a weekly journal published by the Government, and dis-

tributed without charge to mariners, consists almost entirely of reports of derelicts, wreckage, and ice sighted by steamers. On the pilot chart, published monthly by the Government, the distribution of icefields and bergs is shown in minute detail.

As for the origin of the North Atlantic bergs, most of them—the tardier ones—wander south from Greenland, while the early arrivals are products of Labrador and the north-eastern Canadas. Born of the great glaciers of the north, they generally begin to leave home in February, foraging for some weeks in the extreme North Atlantic. On the Labrador coast, as soon as warmer weather arrives, the disintegration of the glacier passes begins. Huge crevices appear, and soon solid mountains of ice begin crumbling, sometimes falling from vast heights with a roar resembling tropical thunder. A favourable wind eventually carrying these icebergs out to sea, they are caught by the Arctic current and freighted southward into warmer waters.

DIGGING FOR DIAMONDS

By WILLIAM ARDOUIN.

I.

IT is an established fact that some of the finest diamonds in the world come from the Kimberley 'River Diggings' and the surrounding areas, yet when these gems sparkle on the necks and hands of rank and fashion, on the society beauties of the different capitals of Europe, amidst happy surroundings of luxury and comfort, one often wonders whether the hard life of the lonely, rugged river digger, who wins these stones from nature's virgin soil, ever enters into consideration. Oftentimes he will ply his thankless task on South African veld in districts which have been relieved of the usual charm and picturesqueness of the country by unwieldy heaps of debris, which crop up with unfailing regularity all along the diggings, and in the majority of cases mark an abandoned claim of an unsuccessful exploiter. It may be that for months on end he has never had a 'find,' during which time he may have been compelled to submit to a process of semi-starvation and to endeavour to sustain life on the common and unattractive 'mealie-pap' fare of the country, patiently living in hope that his efforts will one day be rewarded, and that 'something will turn up.'

Located on different sites within an area of many scores of miles are these diggings, and when it is proposed that certain districts shall be 'proclaimed' for this purpose, an announcement is publicly made to this effect. As the time draws near for the ground to be thrown open, crowds flock from all parts of South Africa

to peg out their claims. The old Boer farmer with his wagon and oxen will be accompanied by the whole of his family retinue. Professional men, journalists, actors, prospectors, clerks, miners, the flotsam and jetsam of the Johannesburg Reef and other large South African towns will hurriedly arrive upon the scene. The South African 'wallabyite' will also be there, not as a rule with the intention of working a claim, but pegging it with the object of some one else making a bid for it. The hour mentioned in the proclamation has arrived, a government official makes the announcement, and the diamond rush commences in earnest. Prospective diggers, who have previously located their ground, rush out in all directions, and once the pegs have been inserted, their ownership in them has been for the time being acquired, which entails payment of a nominal amount to the owner of the ground by way of licence. Excitement usually runs high on these occasions, and there is not infrequently some exhibition of horseplay.

It is a criminal offence in South Africa to be in possession of unwrought stones, and long sentences of imprisonment are imposed for a contravention of the country's laws. In the case of a licensed digger, however, he is called upon to register any finds he may make at the local magistracy, after which he is at liberty to dispose of them to any licensed diamond buyer visiting the property. The registration of the stones, the fact that the debris on his claim is likely to be inspected at any time, and

that he is the owner of the claim, exclude him from the operation of the Act so far as having unwrought stones in his possession is concerned.

II.

On the buyers' arrival, usually a red or a yellow flag is hoisted, and those who have become fortunate possessors of these gems from the earth file out towards the buyers. The stones offered are carefully examined, tested, and weighed; then a price is quoted. If it is not accepted the business is presumed to be off. But, as a rule, money is not too plentiful; and the life of a diamond digger being a precarious one at the best of times, there is very little hesitation in accepting the buyer's offer.

Many years ago, when the Harrisdale diggings near Kimberley were declared open, a certain individual was attracted thereto, and in the course of the first week found two exceptionally large stones. He showed them to an occupant of an adjoining claim, a man whose name was similar to that of one of the geological 'bantams' discovered on the fields, who had spent practically a lifetime at this occupation, made many fortunes and lost them again. He declared the stones to be exceptionally beautiful specimens and worth £8000, if they were worth a penny. The buyer arrived the next day and the stones were brought to him. After some time an offer of £2000 was made for them. 'But I have been advised,' said the seller, 'by one of the best authorities on these fields that the stones are worth £8000.' No advance, however, was made, and the offer was declined. Subsequently another buyer was approached, who was prepared to do business only at £1750. This also was refused. A third buyer was approached; £1500 was offered and declined. This was very puzzling to a man admittedly somewhat lacking in business acumen, who had practically made a fortune on a single throw of the dice, if he could have received adequate value for the stones. After a week's delay, the stones were again brought up to the original buyer who had offered £2000. 'I have had an adverse report on these stones,' he said, 'and as there are several faults in them I am not now prepared to offer you more than £1500.' This offer was inconsiderately and foolishly accepted by the somewhat crestfallen owner.

When the Christiana fields were opened for exploitation they attracted one of the biggest rushes ever known in the history of these diamond fields, around which so much romance has at times been woven. The majority returned sadder but wiser men and women, but to all 'digging' apparently offered an interesting and attractive form of occupation.

III.

At the properties which are referred to in this article, the digging operations are carried on

in a very primitive manner. Two tubs, two or three sieves, fine and coarse, a large metal slab, picks, shovels, tents, canvas, etc., as a rule compose the stock in trade. The debris that comes from diamondiferous soil is very dazzling to the eyes, to protect which it is necessary to wear goggles. Water has to be paid for at so much a bucket, and unless the claim is situated close to the river it often happens that the carter of water makes a much better living than the exploiter of stones.

As a rule, within about three feet from the surface of the earth, the diamondiferous soil is located; then the bright pebbles, bantams, garnets, crystals, etc., make their appearance. When this debris has been finally washed and sieved, in order that the sand, mud, etc., attaching to them may be left behind, the most interesting operation in a digger's life arrives. The diamond itself, being heavier than the other stones and gravel, would sink to the bottom of the sieve during the course of the washing operations, and therefore when it is overturned on to the slab the diamond would appear at the top of the debris. Although nearly all the other stones are dazzling in colour, the appearance of the unwrought stone is so distinguishable that it can be immediately recognised, and with one rebound the digger's heart jumps to high flights of possibilities. The gem is eagerly seized, carefully deposited somewhere on the person, and, if discretion should prevail, the disclosure is not made to neighbouring claim-holders until the buyer arrives.

Washing debris in this manner is one of the most absorbing occupations that can be engaged in. The time goes by with surprising rapidity. Excitement and enthusiasm are kept up to an unusual pitch, as one never knows what may turn up next. Sometimes diggers find little time to eat or smoke, so much is the time begrudged from their precious undertaking.

Many years ago, when the writer of this article was travelling through Bloemhof, after a period of adventure on the diggings, the station-master remarked: 'I wonder that some of you fellows have never come to Bloemhof to try your luck. Recently a Kaffir woman found a black stone on the banks of the Vaal river, and it has often been rumoured that others have found stones and never disclosed them.' Years afterwards it became necessary to pass through this part of the country again. Bloemhof had some little time previously been declared open as a river digging, and within a short space of time a large township had sprung up; stores were established, houses built, hotels installed, and the whole area enjoyed a halo of prosperity. People had rushed up from all over the sub-continent, and many tens of thousands of pounds worth of precious gems were taken from Bloemhof's virgin soil.

Chambers's Journal

SEVENTH SERIES

MY WIFE AND I.

By T. HERAPATH.

PART I.

I.

'VERY probably, Dick,' said my uncle dryly; 'very probably.'

I had been trying to explain to him that the reason why my grandfather, and Uncle Richard's father, had left the Earlesharte estate to me, a good-for-nothing stripling of one-and-twenty, instead of to him, my senior by nineteen years, was because I was such a ne'er-do-weel that there was no other way of steadying me. To be sure, I was the son of the eldest son, and Uncle Richard but the second son; still, it seemed a hard thing that a man of forty should suddenly become cadet, as 'twere, to the lad who had been his subject of cane and lecture for the last ten years. True, he was to live in the house, by the provisions of my grandfather's will, and was to receive a sufficient income, so that his circumstances were practically unaltered. Who, indeed, would think of turning him out? 'Twould be a black heart that would not make him welcome of all the amends that could be offered to him; nor could I imagine Earlesharte Hall without his solid proprietary presence, his grave countenance, his solemn voice. I would have begged his continued company, if only to do the honours of the Hall, to 'welcome the coming, speed the parting guest.' But he had been more or less the regent of Earlesharte ever since I could remember, and I relied on him for much more than this. I needed him to keep the bailiff in subjection (that worthy personage having a will of his own, too often expressed), to check the accounts, to mark such timber as should be felled, to decide what calves should be sold, and what kept. Above and beyond all, to supply the dignity, and inspire the respect, which I felt quite incapable of supplying and inspiring in my own person, as my position required.

'But I shall still do my best for the estate, Dick—and for 'you, and for you,' continued my uncle, filling his big chair in an attitude characteristically magisterial, while I swung my long legs from the table in front of him.

The remark was illuminating; it sketched

No. 738.—VOL. XV.

the future, so to speak, in a nutshell; it swept in the line of my uncle's point of view, and I stopped swinging my legs to contemplate it.

Nothing was changed, then. That was evident. It came as a shock. My late-born feelings of compunction, and impulses for reparation, were nipped. My visions of liberty (somewhat airy, it must be confessed, and undefined) were disagreeably clouded, and began to dwindle rapidly behind familiar barriers.

Uncle Richard's conscientious benevolence was to be exercised, as of yore. He was not so much wronged as I had supposed. His talent for administration was still to be employed. He had administrated Earlesharte, and me, for the past eighteen years; he was going to administrate us still.

I saw all this in a flash, but I felt helpless. 'Tis not in my nature to quarrel with anybody; I have trouble enough with the man who tries to sell me a bad horse. I summoned all the forces of my manhood to bear up against Cotterell, the bailiff, when our opinions differed to a serious extent. Add training to disposition, and you will perceive how impossible it was that I should withstand Uncle Richard.

Our interview ended with the situation tacitly, but unmistakably, defined. I was conscious, not of defeat, for I had never striven, but of resumption (some one is helping me with the writing out of this, or I should never explain it half so well, nor have the use of such words); a little surprised pity may have floated on the surface of my mind at the memory of the dreams I had abandoned. But 'twas never my way to think long about anything, certainly not about anything unpleasant; and I accepted the renewed conditions with, I dare say, a sense of relief. After all, a state of thralldom has its compensations; I get into difficulties enough, even under the strict supervision which I now— But this is anticipating.

II.

For a time things went well. I was more my own master in public, at any rate, than heretofore; and, fortunately, Uncle Richard conceived it to be part of my duty as a country gentleman

[All Rights Reserved.]

JANUARY 17, 1925.

to hunt almost as often as I was minded. I had some ado with rents, and accounts, and so forth, which it seemed 'twas proper I should look at. Otherwise, I contrived to fill my time pretty comfortably with fishing, and a little cock-fighting, and what not, just as before.

'Twas when I had been the nominal owner of Earlesharte for six months that a blow fell—the blow. It descended quite unsuspected, and unforeseen. I had taken it for granted that the years would slip away in comparative ease and irresponsibility for an indefinite period, which I had not troubled my mind by forecasting more explicitly. Perhaps I should have to sit on the local bench of magistrates, a prospect at which I shuddered, but felt convinced, from my uncle's daily lectures on the responsibilities of a landed proprietor, I should sooner or later have to face. But beyond this, and a few more vague conjectures or presentiments, I had not gone.

It therefore came as a great shock to me when my uncle said one evening, as we were sitting over our wine, 'Dick, I have for some months past been more and more occupied with the thought of a solemn duty which it is now time to consider.'

I had been out all day with the Hertshire hounds, and was in the pleasant, lazy mood of a man who has plenty fresh air inside him. I was startled, but reluctant to quit my inward ease, though I knew the words were ominous. Still, I had no notion of what was coming, or you may be sure I should have fled the room 'instantly' on some pretext or another.

'Yes, uncle,' I said drowsily. 'Have some more port—or what do you say, shall we send for a bottle of the yellow seal?' For I was experienced enough to try to stop him, you see.

Uncle Richard was not to be put off, as, indeed, he very rarely could be. 'The subject, Dick,' he returned, 'is that of your marriage.'

I sat up at that. 'My marriage, sir!' I cried. 'Why, I'm but just twenty-one!'

'Very good, Dick. Your father was married at the same age.'

'Ah,' said I, 'I dare say.' For my father was more like Uncle Richard, in some ways. 'But you call it a solemn duty, sir, and I'd rather have more time to think about it before I undertake it. I think in another ten years, maybe—'

'Tut, tut, tut!' said Uncle Richard indulgently. 'A young man of your age ought to be thinking of marriage, Dick. Why, when I was twenty-one—' Here he recollected that he was unwed, and coughed away the allusion, if 'twas going to be one, to a selected, but hypothetical Mrs Earlesharte of the past. 'When I was twenty-one,' he presently pursued, 'I thought seriously on all subjects—("I'll warrant you did," thought I)—although, as I was not in the same position that you are, Dick—the poor

man brought it out with something of an effort, manfully concealed—'I may not have given my attention so particularly to that especial step.'

Oh Uncle Richard, Uncle Richard! And yet you turn red under your periwig as you say it! What lady, I wonder, denied you the happy right to protect and guide a more docile charge, and to superintend the upbringing of your own little olive-shoots instead of your brother's unruly scion? She must have struck you a shrewd blow, whoever she was, to cut you off for ever from those innocent exercises of your native talent, and cause your brow to mantle even now!

'Well, sir,' said I sulkily, 'and who am I to marry?'

He answered quite readily. 'The lady I have in view is Miss Kitty Cunningham.'

'What, little Kitty Cunningham of Long Edge? She's at school, ain't she? I've not seen her these five years.'

'She is coming home shortly. I broached the subject with Sir Lewis, and he gave me to understand that he was perfectly willing she should be settled in life. She is seventeen.'

'What!' cried I. 'You broached the subject, without my consent? Who's to say that I'm willing?'

Uncle Richard looked at me, and threw out his chest, as his manner was when slightly offended. 'I *approached* it,' he returned forbearingly. 'The matter, of course, is one for your own decision. I merely tried the ground.'

He evidently supposed that he had been doing his duty as my father, or my guardian, or both rolled into one, whatever he imagined himself constituted. That an impression of some sort had been conveyed to Sir Lewis Cunningham, who was not a gentleman to be trifled with, was clear. Probably my uncle, in his lumbering way, had given a stronger one than he intended or realised, and had gone far enough, if not to compromise my honour, at least to involve its nicety.

I began to foresee that the next event in my career would be my marriage with Miss Kitty Cunningham.

III.

'How far has it gone, sir?' I asked Uncle Richard politely, three days later at breakfast. I had just received a ceremonious note from Sir Lewis Cunningham, inviting me to dinner at Long Edge on the following Wednesday.

My uncle surveyed me heavily from under his brows. 'To what do you refer, Dick?'

'To the suggestions which I understand you made to Sir Lewis the other day? What did you say, precisely? I am not engaged to Miss Cunningham, am I?'

'Hardly yet,' said my uncle, looking shocked. 'Hardly yet!'

'Oh, very well. I wanted to be sure, you

know, because I am to dine there next week. How far did you and he get? Did you talk about marriage settlements, or anything like that?'

He was not quite certain how to take me. 'Ha . . . ahem,' he said at length. 'No—we spoke of the properties, but it went no further.'

'You didn't say, for instance, that we were of suitable ages, and that I wanted a wife?'

'I did not,' said my uncle, 'compare your age with Miss Cunningham's, but I certainly remarked that you were arriving at the time of life when it is desirable to settle down, and that your position required to be graced by—'

'Oh, my dear uncle!' I interrupted him, with a groan. 'Did you really say that? And to Sir Lewis, too . . . the sharpest old vulture in the county! Did he think it was a message?'

My uncle was struck, not with contrition, for he was supported by an immovable satisfaction in his own conduct, but by some degree of compassion for my dismay. 'Tut, tut,' he said. 'Wait till you've seen her, my boy. It'll be time enough to say whether you like it or not, then. I warrant you'll fall in love with her, straight off, take my word for't.'

I did not reply that it seemed I should have to take his word for the whole business. I hoped for the best, and went a-fishing to distract my mind.

IV.

Ah, and now I pause, and tenderer thoughts for Uncle Richard begin to reproach me when I think upon the young barbarian that I was, and the sweet civilisation he brought me into, though I liked the approaching of it no better than a colt likes his first harness! To think that I told my man Camp, when I came in late from a day by the river on the Wednesday evening, not to be so particular in winding my cravat, and grumbled at Mrs Allison for pinning a moss-rose in my coat—because Uncle Richard looked the finer young gentleman of the two, she said! The news was gone round the household already that I was setting out a-courting; no doubt, I thought, riding down the avenue in a very bad temper beside my composed and benevolent companion, 'twould soon be round the country-side too.

I remember that the honeysuckle was scenting the hedges as we rode along the Westbury road to Long Edge, and that the trees of the park were dark with the full green of summer; so pleasant it was, with a light breeze from the east just puffing in our faces, and the shadows lying long on the grass, that I wished we might have stayed out there under the elms, instead of approaching nearer the square white house within its flowering shrubberies and clipped lawns.

Sir Lewis's great, dark rooms were cool enough, however, and for once I found them tolerable. As a rule, I am never so uncomfortable as

when I am in the Midas-and-Pluto drawing-room at Long Edge (we at Earlesharte have a good old fashioned parlour, and much more agreeable 'tis) or the Pluto-without-the-Midas dining-room; the one hung round with the portraits of Sir Lewis's ancestors, as severe looking as himself, and the other decorated with gold-framed mirrors and Lady Cunningham's embroidery pictures—samplers, I think she calls them, though who could have been such a fool as to sit or stand for the original ensemble of her blotted-featured ladies and poker-like gallants is more than I can imagine.

I remembered little Kitty Cunningham vaguely, and should have had some good-humoured pleasure in seeing her again, and in finding any kind of relief in the society at Long Edge, but for the circumstances that attached to the dinner-party. I expected to meet a little black-haired thing with shy, dark eyes and romping ways. Instead, there stood up before me at Lady Cunningham's side a slim creature, full of fairy dignity, looking, in her green gown, for all the world like a sheathed lily growing in a dull, alien place.

Not even the consciousness of Uncle Richard's betraying satisfaction, of Sir Lewis's stern gaze, or of my Lady Cunningham's critical one could put me out of countenance as I bent over the small white hand extended to me, and saw (through my eyelashes, as 'twere) how the jetty curls fell over her neck when she curtsied. My heart was gone from that moment. When at last we came away, Uncle Richard and I, my mind was fully made up that Kitty Cunningham and no other should be the Lady of Earlesharte.

V.

I did not allow a hint of my resolution to escape me, however. When Uncle Richard asked me, with a sly glance and a doubling of his chin, how I liked the young lady, I answered as carelessly as I could (for my brain was in a whirl of sweet excitement) that I liked her very well, but that she was little more than a child.

'Hum, hum, hum,' said Uncle Richard, still doubling his chins together. 'You stayed by her side the whole evening, sir.'

'I supposed that was what you wanted me to do, sir,' said I. And Uncle Richard replied seriously, 'Quite right, Dick, quite right,' never suspecting that my remark covered newly-hatched thoughts of rebellion.

For you are not to conclude that, in resolving to marry Kitty, I was submitting to him again, part and parcel. On the contrary, I saw that now or never I must make a stand, not only for my own sake but for hers. I pondered upon it as we rode along, and it came to me more and more plainly that if I allowed Uncle Richard to engineer this whole business, and take credit to himself for it, both I and my wife, and my children too, as far as that went, if I had any

would be in leading-strings for the term of Uncle Richard's natural existence.

'No!' said I to myself, slapping Cornet's neck. 'Whatever I do, or don't do, I won't bring *her* under his thumb.'

Cornet gave a start, and Uncle Richard looked round in surprise, but I took no notice. Visions rose before me of little Kitty, ground out of independence by his supervision, and suppressed by his heavy notions of propriety. I could imagine his pompous dicta on what became the Lady of Earlscharte. 'No!' I said to myself, again, and this time I gave Cornet a cut across

the withers that sent him headlong over the grass by the road-side for the next hundred yards.

'You shouldn't do that, my boy,' said Uncle Richard, coming up, puffing.

'Do what, sir?' said I.

'Allow your horse to carry you off in that precipitate manner,' returned he. No doubt I had frightened his own.

'I suppose I can do as I please,' retorted I; and Uncle Richard rode along with his chest thrown out.

ART, A PRODUCT OF SURROUNDINGS.

By DONALD M. HENSCHEL.

I.

ART is universally regarded as one of the most brilliant achievements of mankind, a product of the highest impulse of human nature. It is a thing which all men, save those of imperfect or perverse minds, have always readily appreciated. The contemplation of artistic productions excites a pleasurable sensation, even among the uninitiated, which is nothing else than the gratification of that remarkable lust for beauty and perfection, the heritage of humanity.

But the artistic aspirations of men in different parts of the world have sought their fulfilment in lines so utterly divergent, that what, in some countries, are considered the most exquisite representations of beauty would be regarded by other nations as the consummation of ugliness. In our age we exercise a certain amount of toleration toward all opinions, but what, do you think, would have been the criticism of a connoisseur of the Græco-Roman period had he been miraculously transported to the interior of a Buddhist pagoda in China? He would probably have classified the grotesque paintings, the elaborately carved ivories, the intricate reliefs, as the work of primitive savages. Yet Chinese art has been developed to a far more advanced degree of perfection than that of Greece and Rome.

This great difference in the conception of beauty in various countries is largely due to a difference in the national, or racial, characteristics, but its fundamental and primary cause is undoubtedly geography.

Let us consider for one moment the particular aspects of artistic impulse amongst the oldest civilised people of the earth, the Egyptians. Egypt consists of the lengthy and narrow tract watered by the river Nile. On each side it is bounded by vast, almost unbroken, stretches of desert. The endlessness of these sandy plains, emphasised by the clear atmosphere and the

general flatness of the soil, must have, at an early period, profoundly impressed the natives with the immensity and grandeur of Nature. Hence their passion for beauty must needs find its satisfaction in the colossal. Thus they erected those mighty pyramids, those towering obelisks, which have caused the astoundment of all succeeding generations. Thus they carved, in the midst of impenetrable sands, the stone features of the mysterious Sphinx, expressive of the silent wisdom behind Nature, the unsolved riddle of the ages.

Turn your attention, now, to the characteristic specimens of the art of Assyria. The bas-reliefs of ancient Nineveh represent, for the most part, scenes of combat, of hot action; the sacking of cities, the torment of captives, the collection of booty. It is a formidable display of vigorous human action, full of fierceness, of cruelty, of exultation. This, again, is the product of geographical conditions. Assyria, the upper valley of the Tigris, is a land bordered by mountains, provided with an uncertain, irregular supply of water, and exposed, moreover, to cold winds. The stony nature of the soil, unfavourable to agriculture, exacted from the Assyrian peasant stern and resolute toil. Thus he grew hard and wiry, an energetic fighting-man, insensible to fear and pity. And his nature was reflected in his art, pervading its details and imprinting on it a particular stamp.

Consider India, that marvellous continent of luxurious vegetation, of inextricable jungles haunted by innumerable species of wild animals, of virgin forests, whose intertwined boughs form the sporting-ground of chattering monkeys, of swamps infested by monstrous reptiles. Everywhere the eye is met by testimonies of the manifold wealth of Nature. And India has faithfully reproduced the multifarious bounty of her soil and climate in her art. Her complicated statues of many-limbed deities, her interminable epics, celebrating the numerous incarnations of her gods, her vast subterranean

temples, attest the spirit inculcated in the native by his surroundings.

The idealisation of the beauties of Nature has undoubtedly found its noblest embodiment in the art of ancient Greece. The azure sky, the emerald foliage, the rocky inlets and promontories, formed ample material for the inspiration of the poet and the sculptor. And it was not merely the outward scenery which attracted their fancy. Popular imagination, attributing the phenomena of the earth to the agency of particular deities, peopled the landscape with supernatural beings. The woodland became the sporting-ground of Satyrs, every tree the home of a Dryad, who watched over its growth and pervaded its foliage. On the mountains roamed the Oreads; the Nereïds inhabited the rocky caverns submerged by the sea, and Oceanids guided the course of springs and rivulets through mysterious subterranean channels into the sacred wells and fountains.

As the natural beauties of Greece surpassed those of all other countries, so did Grecian art acquire an incontestable superiority over that of all other nations.

The sculptors of Egypt and Assyria attained their limit of endeavour when they had succeeded in producing an exact resemblance of outward contours. But the Greek sculptor went farther. Not content with the absolute reproduction of external features, he acquired the power to engrave upon them the desirable expression or mood of thought. The blocks of marble which passed under his chisel assumed, not only the forms of life, but also its inner, spiritual essence. This is the highest summit of perfection to which art can aspire.

In the course of ages, however, the standard of Grecian art depreciated. The stern virtues of the early republics gradually giving place to a general moral laxity and enervation, the virile beauty of the ancient statues was supplanted by a new type, of looser build and effeminate aspect.

The fall of Grecian independence completed the ruin of the art, and although Greece remained, for many centuries after, the school wherein artists throughout the civilised world sought guidance and inspiration, yet the decadence of her models became more and more evident as time passed, and the ancient ideals were steadily departed from.

This denotes the influence of history upon art, an important factor which must not be overlooked.

The ancient Romans call for no special mention. Efficient in administration and statecraft, invincible in the field, they betrayed no particular originality in artistic pursuits, and were content to acknowledge the Greeks as their masters and teachers in this branch of culture.

We therefore turn our attention to the Mediæval and Modern periods.

II.

The civilisation of the ancients had been confined to the limited population inhabiting the shores of the Mediterranean Sea. The remainder of Europe consisted of untilled wilderness, swamps, and forests, where scanty settlements of semi-savages won their uncertain means of subsistence by the pursuit of primitive occupations.

These wild tribes had, on numerous occasions, given token of their warlike capacities in the many and frequent incursions which famine or greedy ambition had caused them to make on their southern neighbours. So far these invasions, unsupported by large numbers, had been easily defeated; but in the early centuries of our era, inter-tribal commotions in the great plains and steppelands of Asia and Europe had driven vast barbarian hordes against the natural barriers of the Rhine and the Alps. The degraded Roman Empire, unable to restrain the aggression of the invaders, was submerged by a flood of barbarian conquest.

Europe, at this period, presents a remarkable aspect. It is a maze of different nations, of every race, language, and grade of culture, engaged in almost unceasing strife. The territories of the Empire were parcelled out amongst the various units, and a conglomeration of different states arose upon the ruins of the Old World.

The predominant feature in the mind of the Middle Ages is a grotesque and fantastic conception of the factors of life, derived from this confusion of nationalities. It reveals itself in the intricate designs, the elaborate sculptures, the curiously embroidered tapestries, which decorate the Gothic cathedrals of the Golden Age of Mediævalism.

At first, however, this peculiar characteristic did not assert itself so boldly as at a later period. In the early part of the Middle Ages the formidable supremacy of the Church of Rome retained the popular mind in unquestioning subjection. Art was enlisted in the cause of religion, and restricted to the servitude of ecclesiastical purposes. The earliest style of mediæval architecture accordingly presents a sombre and barren aspect, indicative of the overwhelming power of the priest. The characteristic semi-circular arch is the attestation of hierarchical sovereignty.

It was the influx of new ideas and notions, resulting from the Crusades and the corresponding contact with the refined culture of the Saracens, which tended to emancipate the popular spirit. The architect shook off the rigid fetters which had hitherto bound his art, and undertook new and fanciful enterprises. The Gothic style arose, rich, graceful, complicated, its lofty steeples remindful of the minarets of the East. The gorgeously tinted

window-panes, resplendent with the figures of saints and knights, produced within the place of worship a mysterious twilight gloom. The illuminated missal, decorated with brilliantly coloured designs, testified to the skill of the painter.

The ideal which inspired the mediæval artist was totally different from that of the ancient world. The Grecian sculptor had delighted in shaping the outlines of perfect and heroic manhood. The warrior, the athlete, furnished him with sufficient material for the prosecution of his masterpieces. But the introduction of Christianity gave rise to a new conception of human virtue.

The stern patriotism of the Spartan, the devotion of the Athenian to his fatherland, respect for antiquity and the sanctity of the hearth, indomitable courage in the field—such were the ideal virtues of the ancient world. Christianity, on the other hand, emphasises moral purity, faith in the Divine, and passive mediæval art finds its ideal in the pious endurance of suffering and persecution. Hence the knight, the humble and saintly servant of God. And it finds its type of beauty, not in the noble and masculine expression of the ancient heroes, but in the delicate and effeminate figure of the angel, radiant with complacent beatitude.

The civilisation of ancient Rome had been swamped in Western Europe, and almost every vestige of her culture and learning had disappeared. The learned men of the Middle Ages had but imperfect notions of the glories of the antique world, acquired partly through tradition and partly through the medium of Arabian translators.

The works of the classical writers were still current, however, amongst the scholars of the Byzantine Empire. This last remnant of Roman sovereignty had long maintained a precarious existence in the face of the perpetually growing power of the Turks. The impregnable fortifications of Constantinople had hitherto baffled the ambition of the Ottomans. They had, however, seized her provinces, restricting the domain of the emperors to the walls of their capital.

At length the inevitable fall occurred of the imperial city. On the 29th May 1453, Sultan Mohammed the Second stormed her defences, and established his throne upon the ruins of the Metropolis of Eastern Christendom. The wholesale emigration of learned Byzantines to the hospitable shores of Italy, resulting from this event, gave rise to a general curiosity regarding the wisdom of the vanished Græco-Roman world.

Diligent inquiry gradually revealed the wonderful civilisation of the ancients, and a passionate desire sprang up amongst the artists of the period to emulate their achievements. The barbaric ideals of the mediæval world were discarded. The zeal of the Renaissance produced masterpieces unrivalled in human history.

In Italy, Michael Angelo created the gorgeous allegorical frescoes so remarkable for the splendour and magnificence of their conception, and Raphael depicted, in colours of marvellous brilliancy, the pure and harmonious lineaments of the Divine personages. The works of the Italian school are distinguished by a wonderful abundance of bright colouring. The spectator seems to contemplate a wealth of dazzling sunshine. We recognise in this feature the influence of the Arcadian climate of the Land of Olives.

Beneath the colder skies of the north the German and Flemish masters cultivated a more sombre art, noted, however, for the methodic precision of its execution.

It were futile to dwell upon further examples in support of the assertion which forms the title of this essay. The inquiring reader must use his own observation. But whilst demonstrating the all-powerful influence of external circumstances upon art, we have left unmentioned the problem of its original cause.

For art is like a tree, whose ever-increasing foliage, absorbing life from the surrounding atmosphere, delights the eye by its waxing beauty, whilst the roots remain buried in obscure concealment. The mystery of its origin lies within the mind of man, that unfathomable source from which so many miracles have sprung.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER IV.—*continued.*

ON the morning of the 27th of August, Benjie might have been seen, a little after seven o'clock, driving his cart up the fine beech avenue which led to Glenraden Castle. It was part of his morning round, but hitherto he had left his cart at the lodge-gate, and carried his fish on foot to the house; wherefore he had some slight argument with the lodge-keeper before he was permitted to enter. He drove circumspectly to the back regions, left his fish at the kitchen

door, and then proceeded to the cottage of the stalker, one Macpherson, which stood by itself in the clump of firs. There he waited for some time till Mrs Macpherson came out to feed her hens. A string of haddocks changed hands, and Benjie was bidden indoors, where he was given a cup of tea, while old Macpherson smoked his early pipe and asked questions. Half-an-hour later Benjie left, with every sign of amity, and drove very slowly down the woodland road

towards the haugh where the Raden, sweeping from the narrows of the glen, spreads into broad pools and shining shallows. There he left the cart and squatted modestly in the heather in a place which commanded a prospect of the home woods. From his observations he was aware that one of the young ladies regularly took her morning walk in this quarter.

Meantime, in the pleasant upstairs dining-room of the Castle, breakfast had begun. Colonel Alastair Raden, having read prayers to a row of servants from a chair in the window—there was a family tradition that he once broke off in a petition to call excitedly his Maker's attention to a capercailzie on the lawn—and having finished his porridge, which he ate standing, with bulletins interjected about the weather, was doing good work on bacon and eggs. Breakfast, he used to declare, should consist of no kickshaws like kidneys and omelettes; only bacon and eggs, and plenty of 'em. The master of the house was a lean old gentleman, dressed in an ancient loud-patterned tweed jacket and a very faded kilt. Still erect as a post, he had a barrack-square voice of immense power and compass, a high-boned aquiline face, and a kindly but irritable blue eye. His daughters were devoting what time was left to them from attending to the breakfasts of three terriers to an animated discussion of a letter which lay before them: The morning meal at Glenraden was rarely interrupted by correspondence, for the post did not arrive till the evening, but this missive had been delivered by hand.

'He can't come,' the younger cried. 'He says he's seedy again. It may really be smallpox this time.'

'Who can't come, and who has smallpox?' her father demanded.

'Sir Archibald Roylance. I told you I met him and asked him to lunch here to-day. We really ought to get to know our nearest neighbour.'

'I think he is hiding a dark secret,' said the elder Miss Raden. 'Nobody who calls there ever finds him in—except Lady Claybody, and then he told her he had smallpox. Old Mr Bandicott said he went up the long hill to Crask yesterday, and found nobody at home, though he was perfectly certain he saw one figure slinking into the wood, and another moving away from a window. I wonder if Sir Archibald is really all right. We don't know anything about him, do we?'

'Of course he's all right—bound to be—dashed gallant, sporting fellow. Sorry he's not coming to luncheon—I want to meet him. He's probably afraid of Nettie, and I don't blame him, for she's a brazen hussy, and he does well to be scared of old Bandicott. I'm scared to death by the fellow myself.'

'You know you've promised to let him dig in the Piper's Ring, papa.'

'I know I have, and I would have promised to let him dig up my lawn to keep him quiet. Never met a man with such a flow of incomprehensible talk. He had the impertinence to tell me that I was no more Highland than he was, but sprung from some blackguard Norse raiders a thousand years back. Judging by the sketch he gave me of their habits, I'd sooner the Radens were descended from Polish Jews.'

'I thought him a darling,' said his elder daughter, 'and with such a beautiful face.'

'He may be a darling, for all I know, but his head is stuffed with maggots. If you admired him so much, why didn't you take him off my hands? I liked the look of the young fellow and wanted to have a word with him. More by token——' the colonel was hunting about for the marmalade—'what were you two plotting with him in the corner after dinner?'

'We were talking about John Macnab.'

The colonel's face became wrathful. 'Then I call it confoundedly unfilial conduct of you not to have brought me in. There was I, deafened with the old man's chatter—all about a fellow called Harald Bottlenose, or some such name, that he swears is buried in my grounds and means to dig up—when I might have been having a really fruitful conversation. What was young Bandicott's notion of John Macnab?'

'Mr Junius thinks he is a lunatic,' said the elder Miss Raden. She was in every way her sister's opposite, dark of hair and eye, where Janet was fair, tall where Janet was little, slow and quiet of voice where Janet was quick and gusty.

'I entirely differ from him. I think John Macnab is perfectly sane, and probably a good fellow, though a dashed insolent one. What's Bandicott doing about his river?'

'Patrolling it day and night between the 1st and 3rd of September. He says he's taking no chances; though he'd bet Wall Street to a nickel that the poor poop hasn't the frozenest outside.'

'Nettie, he said nothing of the kind.' Miss Agatha was indignant. 'He talks beautiful English with no trace of an accent—all Bostonians do, he told me.'

'Anyhow, he asked what steps we were taking, and advised us to get busy. We come before him, you know. . . . Heavens, papa, it begins the day after to-morrow! Oh, and I did so want to consult Sir Archibald. I'm sure he could help.'

Colonel Raden, having made a satisfactory breakfast, was lighting a pipe. 'You need not worry, my dear. I'm an old campaigner, and have planned out the thing thoroughly. I've been in frequent consultation with Macpherson, and yesterday we had Alan and James Macrae in, and they thoroughly agreed.'

He produced from his pocket a sheet of foolscap on which had been roughly drawn a map of the estate.

'Now, listen to me. We must assume this fellow Macnab to be in possession of his senses, and to have more or less reconnoitred the ground—though I don't know how the devil he can have managed it, for the gillies have kept their eyes open, and nobody's been seen near the place. Well, here are the three beats. Unless young Bandicott is right and the man's a lunatic, he won't try the Home beat, for the simple reason that a shot there would be heard by twenty people, and he could not move a beast twenty yards without being caught. There remain Carnmore and Carnbeg. Macpherson was clear that he would try Carnmore as being farthest away from the house. But I, with my old campaigning experience—here Colonel Raden looked remarkably cunning—'pointed out at once that such reasoning was rudimentary. I said, "He'll bluff us; and just because he thinks that *we* think he'll try Carnmore, he'll try Carnbeg." Therefore, since we can only afford to watch one beat thoroughly, we'll watch Carnbeg. What do you think of that, my dears?'

'I think you're very clever, papa,' said Agatha. 'I'm sure you're right.'

'And you, Nettie?'

Janet was wrinkling her brows and looking thoughtful. 'I'm . . . not . . . so . . . sure. You see, we must assume that John Macnab is very ingenious. He probably made his fortune in the Colonies by every kind of dodge. He's sure to be very clever.'

'Well, but, my dear,' said her father, 'it's just that cleverness that I propose to match.'

'But do you think you have quite matched it? You have tried to imagine what John Macnab would be thinking, and he will have done just the same by you. Why shouldn't he have guessed the conclusion you have reached and be deciding to go one better?'

'How do you mean, Nettie?' asked her puzzled parent. He was inclined to be annoyed, but experience had taught him that his younger daughter's wits were not to be lightly disregarded.

Nettie took the estate map from his hand, and found a stump of pencil in the pocket of her jumper. 'Please look at this, papa. Here are A and B. B offers a better chance, so Macpherson says John Macnab will take B. You say, acutely, that John Macnab is not a fool, and will try to bluff us by taking A. I say that John Macnab will have anticipated your acumen.'

'Yes, yes,' said her father impatiently; 'and then?'

'And will take B after all.'

The colonel stood rapt in unpleasant meditation for the space of five seconds. 'God bless

my soul!' he cried. 'I see what you mean. Confound it, of course he'll go for Carnmore. Lord, this is a puzzle. I must see Macpherson at once. Are you sure you're right, Nettie?'

'I'm not in the least sure. We've only a choice of uncertainties, and must gamble. But as far as I see, if we must plump for one we should plump for Carnmore.'

Colonel Raden departed for his study, after summoning Macpherson to that shrine of the higher thought, and Janet Raden, after one or two brief domestic interviews, collected two terriers and set out for her morning walk. The morning was as fresh and bright as April, rain in the night had set every burn singing, and the thickets and lawns were still damp where the sun had not penetrated. Her morning walk was wont to be a scamper, a thing of hops, skips, and jumps, rather than a sedate progress, but on this occasion, though two dogs and the whole earth invited to hilarity, she walked slowly and thoughtfully. The mossy broken tops of Carnbeg showed above a wood of young firs, and to the right rose the high, blue peaks of the Carnmore ground. On which of these would John Macnab begin his depredations? He had two days for his exploit; probably he would make his effort on the second day, and devote the first to confusing the minds of the defence. That meant that the problem would have to be thought out anew each day, for the alert intelligence of John Macnab—she now pictured him as a sort of Sherlock Holmes in knickerbockers—would not stand still. The prospect exhilarated, but it also alarmed her. The desire to win a new hunter was now a fixed resolution; but she wished she had a colleague. Agatha was no use, and her father, while admirable in tactics, was weak in strategy; she longed more than ever for the help of that frail vessel, Sir Archie.

Her road led her by a brawling torrent through the famous Glenraden beechwood, to the spongy meadows of the haugh, beyond which could be seen the shining tides of the Raden sweeping to the high-backed bridge across which ran the road to Carnmore. The haugh was all bog-myrtle and heather and bracken, sprinkled with great boulders, which the river during the ages had brought down from the hills. Half a mile up it stood the odd tumulus called the Piper's Ring, crowned with an ancient gnarled fir, where reposed, according to the elder Bandicott, the dust of that dark progenitor, Harald Blacktooth. If Mr Bandicott proposed to excavate there he had his work cut out; the place was encumbered with giant stones, a thousand floods having washed its sides since it first received the dead Viking. Great birch woods from both sides of the valley descended to the stream, thereby making the excellence of the Home beat, for the woodland stag is a heavier beast than his brother of the high tops.

Close to the road in a small hollow, where one of the rivulets from the woods cut its way through the haugh, she came on an ancient cart resting on its shafts, an ancient horse grazing on a patch of turf among the peat, and a small boy diligently whittling his way through a pile of heather roots. The urchin sprang to his feet and saluted like a soldier. 'Please, lady,' he explained in a high falsetto whine, 'I've gotten permission from Mr Macpherson to make heather besoms on this muir. He's aye been awfu' kind to me, lady.'

'You're the boy who sells fish. I've seen you on the road.'

'Ay, lady, I'm Fish Benjie. I sell my fish in the mornin's and the evenin's, and I've a' the day for other jobs. I've aye wanted to come here, for it's the graundest heather i' the country-side, and Mr Macpherson, he kens I'll dae nae harm, and I've promised no' to kindle a fire.'

The child with the beggar's voice looked at her with such sage and solemn eyes that Janet, who had a hopeless weakness for small boys, sat down on a sun-warmed hillock and stared at him, while he turned resolutely to business.

'If you're hungry, Benjie,' she said, 'and they won't let you make a fire, you can come up to the castle and get tea from Mrs Fraser. Tell her I sent you.'

'Thank you, lady; but if *you* please, I was gaun to my tea at Mrs Macpherson's. She's fell fond o' my haddies, and she tell't me to tak

a look in when I stoppit work. I'm ettlin' to be here for a guid while.'

'Will you come every day?'

'Ay, every day about eight o'clock, and bide till maybe five in the afternoon, when I go down to the cobbles at Inverlarrig.'

'Now, look here, Benjie. When you're sitting quietly working here, I want you to keep your eyes open, and if you see any strange man, tell Mr Macpherson. By strange men I mean somebody who doesn't belong to the place. We're rather troubled by poachers just now.'

Benjie raised a ruminant eye from his besoms. 'Ay, lady. I seen a queer man already this mornin'. He came up the road and syne started off ower the bog. He was sweatin' sore, and there was twa men from Strathlarrig wi' him carryin' picks and shovels. . . . Losh, there he is comin' back.'

Following Benjie's pointing finger Janet saw approaching her from the direction of the Piper's Ring a solitary figure which laboured heavily among the peat-bogs. Presently it was revealed as an elderly man wearing a broad gray wide-awake and a suit of flannel knickerbockers. His enormous horn spectacles clearly did not help his eyesight, for he had almost fallen over the shafts of the fish-cart before he perceived Janet Raden. He removed his hat, bowed with an antique courtesy, and asked permission to recover his breath.

THE CASE OF GOVERNOR EYRE.

By HORACE WYNDHAM.

I.

IT is very seldom that a man holding, or who has held, the important position of governor of a British colony, with all the pomp and circumstance thereby involved, finds himself standing in the dock of a criminal court. Yet it has happened twice within the last hundred and twenty years. The first case was that of Governor Wall, who went from a prison cell to the public gallows; and the second was that of a distinguished ex-civil servant who died so recently as 1901. As he was acquitted of the charges brought against him, the authorities had to award him a pension, which he lived to enjoy for thirty years.

The man who thus triumphantly vindicated his honour, and stepped from the Old Bailey (via Bow Street) back to freedom, was Edward John Eyre, ex-governor and commander-in-chief of Jamaica. His trial, which was held in 1868, caused tremendous public interest, and its echoes lasted for many years afterwards.

To trace the various happenings that brought

this distinguished public official from the pomp of Government House in a British colony to the grim shadow of Newgate, it is necessary to go back to the year 1865. Mr Eyre, who was then just turned fifty, had served in New Zealand, first as a magistrate, and afterwards as lieutenant-governor under Sir George Grey. As a reward for his good work, he was appointed successively governor of the islands of St Vincent and Antigua. Proving himself an able administrator, he was regarded with favour by the powers in Whitehall and earmarked for early promotion. In 1862 an opportunity occurred, and he was specially selected as captain-general of Jamaica. A couple of years later, when Sir Charles Darling resigned, he was advanced to the more important position of governor and commander-in-chief.

All promised well. The new official discharged his responsible duties in an efficient fashion, and was looked upon as a coming man, with a still better appointment and a peerage awaiting him in the fullness of time.

II.

But the governorship of Jamaica was fraught with peculiar difficulties. A spirit of unrest brooded over the island, and something very like what would now be termed 'Bolshevism' was afoot. The 'coloured gentlemen,' who formed the vast majority of the population, had, under the easy régime of Sir Charles Darling, begun to get out of hand. They were distinctly 'uppish,' and inclined to consider themselves just as good as—if not, indeed, better than—anybody else.

Eyre saw the storm that was brewing and, not being the man to stand any nonsense, dealt vigorously with cases of misconduct and disloyalty. Angry mutterings and threats to petition for his recall left him quite undisturbed. In October 1865 affairs came to a head. The negro element at Kingston, objecting to the arrest of one of their number, adopted a threatening attitude towards the forces of law and order. A firebrand among them voiced their alleged 'grievances,' and demanded that his comrades should follow him and set up a 'black republic.' Inflamed with drink, armed with razors attached to poles, and egged on by the windy promises of mob orators, they rushed through the town, resisting the police. The next thing they did was, at a preconcerted signal, to break out into open rebellion and embark upon a campaign of bloodshed and riot and pillage. Since the 'coloured gentlemen' outnumbered the Europeans by nearly thirty to one, and committed shocking excesses, the situation soon became very serious. The white troops in the garrison amounted only to a handful; and women and children were in grave peril.

The governor was not the man to shirk responsibility. Proclaiming martial law, he assembled a small but trustworthy force, and warned the mob that any of them refusing to disperse would be dealt with in severe fashion. The rioters laughed at what they regarded as an empty threat, and went on burning and looting. The threat, however, was no empty one. Eyre meant what he said and a bit more. Before they quite realised what was happening, a number of those captured red-handed found themselves behind bolts and bars.

The next act in the drama was the holding of a series of courts-martial. These resulted in certain ringleaders being brought out to face firing-parties at dawn, and others dangling from public scaffolds. The cat-o'-nine-tails also whistled vigorously over six hundred dusky backs, and long terms of imprisonment were awarded to various others whose guilt was fully proved.

Howls and lamentations filled the balmy air of Jamaica. Some of them were even wafted to distant England. A body of sympathisers with razor-slashing rebels formed themselves into

a 'Jamaica Committee,' and lustily clamoured for Eyre's recall. Thereupon, a Royal Commission, presided over by Sir Henry Storks, went out to the island, and held an inquiry there which lasted from January to March. After taking a considerable amount of evidence, they reported that, while Eyre had undoubtedly stopped serious rioting, he had 'subsequently acted with unnecessary rigour.' The result was, he was deprived of his governorship and relieved by Sir John Grant.

According to the evidence, it appears that, although animated by nothing but good intentions, Eyre certainly did in one instance act from an excess of zeal. He had a notorious rebel, who was captured at Kingston (where martial law had not then been set up), tried at Morant Bay. On conviction for high treason, this man was well and truly hanged. This prisoner, a mulatto called George William Gordon, happened to be a member of the Legislative Assembly, and a prominent Baptist. As a result, there were lots of people to take his part, and public opinion in England ran very high. It operated, however, in both directions. Thus, while Eyre was burned in effigy by his detractors, he was given a series of banquets by his supporters.

III.

The official decision to deprive Eyre of his appointment was not enough for the 'Jamaica Committee,' of which body, by the way, John Stuart Mill was chairman, and Professor Huxley and Herbert Spencer were members. Accordingly, they pulled fresh strings, and when Eyre came home, they instituted proceedings against him for 'murder.' They also included in their attentions Lieutenant Brand, R.N., and Colonel Nelson, who had conducted a court-martial. The case of the two subordinates was taken first. After a preliminary appearance before a magistrate, they were committed to the Old Bailey. The Grand Jury, however, showed what they thought of the prosecution by throwing out the bill.

But if Eyre had enemies, he also had friends, who considered that upholding the prestige of the white man (together with that of white women and children) was more important than protecting the delicate susceptibilities of a riotous mob of negroes. Accordingly, an 'Eyre Defence Fund,' amounting to £1600, was speedily organised. Among the subscribers were such well-known public men as Thomas Carlyle, Charles Kingsley, Ruskin, Tennyson, and Lord Cardigan; and the counsel briefed by them included a future lord chancellor and a judge, in Hardinge Giffard (afterwards Lord Halsbury) and Fitzjames Stephen. Eyre appeared at Bow Street (where the 'murder' charge was softened into one of 'misdemeanour') and committed for trial at the Old Bailey in

June 1868. Much to the annoyance of the John Stuart Mill party (whom Carlyle dubbed a 'pack of nigger philanthropists'), the Grand Jury declined to return a true bill.

The 'Jamaica Committee,' however, seemed remarkably vindictive. Accordingly in 1869 they took fresh proceedings on behalf of a mulatto named Phillips, who wrung their ultra-sympathetic hearts by declaring that he had been improperly punished by Eyre for his share in the *émeute*. This time they launched a civil action and claimed heavy damages for 'false imprisonment.' Once more, however, their luck was out, as Eyre had been granted a bill of indemnity by the local legislature.

As a result, the Crown had to pay him his costs, and also to grant him the pension to which he was entitled for his past services. This he lived to draw until his death in 1901.

After this interval, it is difficult to decide the rights and wrongs of the 'Governor Eyre Case,' or to appreciate the tremendous public interest it aroused. Still, considering the issues involved, the general verdict will probably be that of Carlyle, who declared Edward John Eyre to be 'a just, humane, and valiant man, faithful to his trusts everywhere, and with no ordinary faculty for executing them.'

PETER WAS SINGLE.

PART III.

X.

BEFORE Thursday evening came, Peter was destined to visit once again the private office. Judged by ordinary standards, however, the interview was quite a pleasant one. Mr Reginald was almost effusive. He waved Peter to the chair on the opposite side of the desk, and said that he had splendid reports about the progress of the hosiery department; he had also seen things for himself. The great thing was, of course, that this highly satisfactory standard set by Peter should be maintained and improved upon if possible. Mr Reginald expected the new standard to be maintained. Did Golding think he could keep it up?

The question rather alarmed Peter. He knew perfectly well, and Mr Reginald must know perfectly well, that with all the will in the world the staff could not go on breaking records indefinitely. He now had sufficient confidence in himself to feel capable of keeping the work of his department up to a very high level of efficiency, so wisely he remained silent.

'Our arrangement was that you should have a month's trial,' Mr Reginald reminded him. Then he added in an impressive voice, 'Now, look here, Golding, if you'll guarantee to keep the present high standard, I'll come to an agreement with you *now*. I am convinced that you will suit me; moreover, I like you personally—I liked you from the first. You will, of course, receive a substantial increase of salary. You may ask anything you like within reason—we are not mean with money.' (This was perfectly true). 'Now, what do you say, Golding?'

Peter shook his head. 'I think it will be better to let the present arrangement stand a little longer, Mr Reginald. You see, I have been trying new methods, and although their immediate result has been so satisfactory, the

success may not be permanent; it's rather early to decide.'

Mr Reginald shrugged his shoulders. 'Just as you like, my dear Golding, just as you like. We will leave the agreement until the end of the month, but I have every confidence in you—complete confidence.'

As he closed the door of the private office, Peter shivered slightly. 'The man actually fawned on me,' he thought. 'He is fabulously rich; he has more money than he could spend if he lived to be a hundred, yet just because he thinks I can squeeze a little extra work out of the staff, he actually called me his dear Golding. Disgusting!' In this, at least, Peter did not do Mr Reginald justice; before everything, the latter was a business man. He loved the intrigues and the little dishonesties, of which even businesses of the highest standing are not quite guiltless, as much for their own sake as for the great wealth that his business capacity brought him. Because the hosiery department had broken a record which even he, with all his knowledge and foresight, had deemed intact, he extended to Peter exactly the same homage which the latter would have felt only for a great artist. The fact that Mr Reginald had given so obviously inexperienced a young man as Peter a chance in the first place proved that he liked him, and although Peter did not realise it, he in turn rather liked Mr Reginald.

They liked each other because each, in his way, was an artist.

XI.

On Thursday evening Miss Slade and Peter met in the dark little street which runs alongside the warehouse, and proceeded to the cinema, where the latter had already booked seats. The girl was silent, and her escort far too self-conscious and embarrassed to attempt the light conversation the occasion seemed to demand.

The occasional glimpses he was able to catch of her profile from the corners of his eyes showed her expression to be troubled, and he felt miserably that she regretted having promised to spend the evening with him. He had almost decided to offer to release her while there was still time, when she spoke.

'I shall always remember this evening,' she said, and the sincerity of her gentle voice thrilled him so that he was unable to answer. 'Always,' she repeated in a voice so low that he only just caught the word. He was glad now that speech eluded him; there was nothing ungracious in silence, for the girl had spoken to herself rather than to him.

There was a gorgeous café attached to the cinema, and Peter led the way to a small table in a quiet corner far away from the orchestra. From the deferential waiter who approached them with the air of one who had worked all his life in preparation for that moment, Peter, with the assistance of his companion, ordered a light meal. The girl's sad demeanour underwent a complete transformation, and she abandoned herself to a mood of gentle gaiety. Her blue eyes began to sparkle, and her colouring, always high, now became so brilliant that a stranger seeing her for the first time might have been excused for suspecting a too liberal use of cosmetics. But Peter knew there was nothing artificial about those pink cheeks and that red mouth, dimpling and curving with mirth! It seemed to him that he could actually see the colour deepening, and this evening he understood for the first time that his companion possessed a keen sense of humour, which was entirely free from malice. She was not brilliant, and probably said nothing worth remembering, but her manner in uttering a simple little jest, and her quick, bubbling laugh delighted him; yet, beneath it all he felt that she was terribly unhappy—there was the shadow of tragedy behind her sparkling eyes, and her gentle laughter sometimes ended in a little sigh.

'It's as if she's doing something for the last time,' he thought; 'as if . . . she is saying good-bye. . . . Ah, if only I could help—if only I could reach out and comfort her . . . if only I had the right.'

XII.

The cinema entertainment concluded with a seven-reel drama which proved conclusively that virtue, in America at all events, invariably triumphs in the end. And then, leaving the beautiful and expensive heroine safe in the arms of the handsome and only slightly less expensive hero, Peter escorted his companion to the station. There they discovered that her train, which was already in, would not depart for nearly ten minutes, and they strolled the full length of the platform in silence.

'Perhaps you would prefer to leave me and—

and wait in the train?' suggested the diffident Peter.

She dismissed the suggestion with a quick shake of her head, and then said, 'Unless you are anxious to get home? You, too, have a train to catch, haven't you?'

'Oh, they run every few minutes on our line,' he answered eagerly and, for all he knew to the contrary, truthfully.

There was another silence, and then the girl spoke again. 'It is over, our evening together,' she said with a sigh. 'Thank you so much; I shall never forget.' Her lips trembled oddly with the last word, and it was with unshed tears that her eyes were bright now. Her emotion was so much stronger than the occasion seemed to warrant, that the young man was quite startled for the moment. He soon recovered the use of his tongue again.

'But you will come with me again—soon!' he urged in a low voice. 'Say that you will!' Greatly daring, he took one of her hands. She did not answer, but made no attempt to release her hand. Many shy people have the rare quality of being able to face life's greatest crises squarely and steadily; the blundering, boyish Peter was one of them. He drew the girl a little closer to him.

'Listen, dear,' he said quietly; 'they are satisfied with me down at Clawson's, and want me to stay on. Mr Reginald has asked me to sign an agreement, and offered terms which will—will make many things possible in the future. My—or—prospects are really rather good, you see. . . . I have heard them say, down at the warehouse, that you are alone in the world. Well, I am alone in the world, too. If, in time, you find that you—you—' For the first time Peter's voice faltered. 'I mean to say that loneliness is a beastly thing, and if ever you came to like me about a hundredth part as much as I like you—'

The girl uttered a low cry of pain. 'Oh, Peter, you must not say such things to me! You must not! Ah, what have I done? What have I done?'

Peter sighed. 'Please forgive me for distressing you like this,' he said simply. 'I was a fool for ever daring to think—'

Her hands fluttered against his for a moment. 'Don't think that, Peter. It isn't true. I ought to let you keep on thinking that I—I am indifferent, but—I haven't the courage.'

Peter, sorely perplexed, tried to take her hands again, but the girl eluded him. She was crying frankly now. 'Oh, what have I done?' came from her again.

'If you're not altogether indifferent, give me an answer now,' urged the young man. 'At least tell me that I may keep on hoping.'

She stood irresolute for a moment, and then said quickly, 'A train leaves this platform at 7.30 on Sunday evening. No matter what the

weather is like, I shall be waiting at the other end, and if you are on the train, I will give you my answer. Good-night, Peter, and—and God bless you.'

She was gone.

Peter remained motionless, oppressed by a nameless dread. Soon the train began to draw slowly out of the station, but he made no attempt to approach, feeling instinctively that she desired to be alone. There was something so poignant and childlike about her last simple blessing that the memory of it made his heart swell. Helen Slade was of that frank, steadfast

type of girl that never quite loses certain traits of its childhood; there were fleeting moments when her sixth year was as eloquent in her eyes and the curves of her mouth as her twentieth. Peter carried away from the station with him a mental picture, not of the girl with whom he had spent the evening, but of a little child in a long white nightdress, a child of six, with big blue eyes and a grave mouth, standing on tip-toe and reaching out loving arms to some one unseen and saying, 'Good-night, mummy, and God bless you. . . .'

(Continued on page 116.)

A VENDETTA.

I.

ON the morning of 25th March 1809 the news spread like wildfire in the peaceful commune of lower Rostino (Corsica) that the famous bandit Orlanducci had just been captured by the gendarmes. The adventure took place one night in thick *maquis*¹ situated above the village of Frasso.

Nothing could have been more surprising, because Orlanducci was the most ingenious bandit in the whole of Corsica. For the last three years he had evaded justice, and the gendarmes had not been able to track him. He was a bandit it seemed impossible to capture. People were asking how the gendarmes happened to be there so opportunely that very night.

The word treason was whispered. No other explanation was possible. Orlanducci had been betrayed by some one who knew exactly his habits and his place of refuge. People racked their brains over the matter.

But soon the event passed by; and except at Grâté, Orlanducci's birthplace, this bandit, who after all was not so attractive, was forgotten. Like most of his kind, his history had begun with a murder committed for the sake of vengeance. He took refuge in the *maquis* to escape justice, and as a matter of course had not hesitated to exchange shots with the gendarmes. He had killed a *brigadier* and wounded two or three men, quite enough for a price to have been put on his head. The bait must have tempted some traitor.

Orlanducci was tried some time after, condemned to death, and executed. To all appearances the matter ended there, because no one was specially interested in his fate. He had no near relation except a young sister of fifteen or sixteen, a very weak and timid creature, absolutely incapable of pursuing the murderer with

vengeance. Soon the affair of Orlanducci was ancient history.

II.

But suddenly in April 1810 other news spread. A man of some importance in the village, who did duty as *notaire* in Morosaglia, was found assassinated in a chestnut wood not far from the village—a peaceful man, esteemed by all, and thought to be without enemies. The wonder was, whose hand had struck him? Doubt was, however, soon removed. When the authorities arrived, and were about to remove the body, a paper was found pinned to the back of the coat. On this paper, in very clear handwriting, were these words: 'This man sold Orlanducci. He accepted the sum of five hundred francs. To-day he is paying the price of his betrayal.'

Naturally the general stupefaction was great. Although the bait of money explains many things, no one would ever have thought of suggesting that a man of his position would commit such an action. Many people refused to believe it. But what above all excited the curiosity of the public was the mystery which shrouded this crime—who was the murderer?

Thoughts were turned towards Orlanducci's sister, but that seemed quite impossible. In addition to the fact that she was a weak creature, everybody knew she could neither read nor write. Now, the note found on the victim was correctly composed in the most perfect French. Besides, the two fatal wounds—a bullet in the heart and one in the forehead—were not the work of a woman's hand: they spoke of a strong and steady aim.

The mystery became still more absorbing when the sudden disappearance of Orlanducci's sister was reported. She had left her village the day before the crime, and, since then, had never been seen; she was evidently mixed up in the affair. The gendarmes received orders to look for and arrest her. But the days passed by,

¹ Brushwood of lentisk, arbutus, cistus, juniper trees.

and the girl was not to be found. Most extraordinary stories were told about her. Every now and then some one was supposed to have seen her. At first in the chestnut wood, on the mountain-side, where she was dressed like a man, and carried a gun on her shoulder; next, hiding in the *maquis*. She looked quite mad, and she had asked for bread. Others said that she was travelling disguised as a beggar, and more and more was reported on these lines. The very diversity of these stories proved them alike untrue.

In fact, nobody knew anything for certain. Sensible people thought that the young girl had left the country with the accomplice who had helped her to carry out her design.

As to the victim, he was much less pitied when it was known that he had really received a draft for five hundred francs at the *greffier's* office at Bastia a little while after Orlanducci's arrest.

III.

Two months passed thus, and these events were being forgotten, when suddenly all the excitement was again aroused and renewed. A new complication arose, which drew forth general curiosity more than ever. Nothing more strange had ever been heard of.

It was the end of June 1810. Two poor inhabitants of Graté, named Bernardi, man and wife, were coming back quietly from the mill on the Golo, where they had carried their corn to be ground. They were coming with difficulty up the path which led to their village, when, arrived at a deserted spot, they encountered two individuals. It was nearly dusk. One of the two new-comers, a young, robust man, placed himself across the path, and barred the passage to Bernardi, saying, 'It's you, Bernardi of Graté, isn't it?'

Bernardi having replied in the affirmative, the young man added in a calm voice, 'Then prepare to die!' And before the very eyes of the terrified wife the bandit¹ fired a shot, striking Bernardi in the temple. Making quite sure that the unfortunate man was dead, the stranger went towards the wife and said to her, 'Bernardi received thirty francs from the *notaire* for taking the gendarmes to Orlanducci's hiding-place. To-day he is paying the price!' At the end of these fatal words he departed, followed by his companion, who was no other than Orlanducci's sister, disguised as a man. Bernardi's wife had recognised her most distinctly.

When the inhabitants of Graté came to carry away the body, they found a paper pinned to the clothes of the deceased. On it the following words could be read: 'Another man besides Bernardi has received thirty francs to deliver

Orlanducci up to justice; whatever he does, he will have the same fate.'

IV.

It is unnecessary to describe the emotion this event caused in the whole district. The most appalling uneasiness was aroused, and anxiety was increased by the prospect of yet another murder.

Who was the terrible man, Orlanducci's avenger? This cultured assassin who wrote in such correct style on the body of his victims? Certainly murderers were not scarce in Corsica, but such sang-froid, such audacity, such presumption had never been seen before.

What excited the people more were the stories told by Bernardi's widow. Summoned to give evidence before the Court of Justice, she related most extraordinary things. First came the description of the girl dressed as a man, with hair hanging in plaits on her shoulders. Secondly, the description of the assassin, a handsome youth, with a brown moustache—a real Hercules—wearing, strange to say, a uniform quite unknown in the country: breeches and long coat, with facings on the sleeves and on the chest. All this was very extraordinary, and the repeated assertions of the only witness were necessary to convince the public of these facts.

Stories got about. It was said that the girl Orlanducci, who was rather pretty, had married a great Turkish lord, who, for love of her, had become her brother's avenger. People spoke of nothing else; the women particularly had no other subject of conversation. The matter was taken up seriously. A very minute inquiry was made, which resulted in the discovery that the bandit Orlanducci possessed a half-brother, who had left the country when very young. Nothing more had been heard of him, and most people thought that he was dead. The authorities took the matter in hand; and as the description of the assassin answered to that of a deserter, investigation was made in that direction. Information was sought in Paris from the Minister of War, and here is a copy of the notice received some time after:

'Orlanducci, Jacques, volunteer—4th July 1796, in the 24th Light Infantry Brigade, became (in 1804) non-commissioned officer in the 113th line, served in Italy, Russia, and Austria. Appointed sergeant-major in the 9th Company on 1st March 1809, has been reported "missing" since the battle of Wagram.'

It was probably our man. The battle of Wagram took place on 6th July 1809, and the disappearance of Orlanducci fitted in with these events. Informed by his sister or some other person, he had left the army to return to the island. The thing astonished people a little, happening after so many years' absence, but family unity—so marked in every Corsican

¹ *Brigands* and *bandits* are not to be confounded. In this country the former kill for money or valuables, and are very rare; the latter kill to avenge the murder of a member of their own family, or for honour!

—has produced similar miracles, and many of them. Justice had no longer any doubts. The notes written in such regular writing on the victims could now be explained. Everbody knows that a sergeant-major has the pen of a ready writer. This one had brought his talent to the depth of the *maquis*, and made good use of it.

The idea of the great Turkish lord was given up, and ever after Orlanducci's avenger was known as the 'Sergeant-major.'

V.

There was a man, meanwhile, who would have given all he possessed to see the avenger captured. He was a certain Rognoni of Graté, who knew very well in his secret heart that he, as well as Bernardi, had once taken thirty francs to deliver the bandit Orlanducci to the gendarmes. One can understand that this man was not at his ease. The first few days he pretended to be ill, so as not to have to go out. Then, anxiety getting the better of him, he ended by owning to his wife what danger he was in. The latter, overcome with fear, advised him to go to Bastia to put himself under the protection of the 'Procureur Impérial.' Rognoni did this, and having stated his case to the authorities, he entered the prison as a voluntary prisoner. It is said that he still trembled behind the walls of his cell.

At the same time, the authorities made great efforts to find the whereabouts of the avenger. A price was put on Jacques Orlanducci's head, and in addition, several brigades of gendarmes started for Rostino in order to search the *maquis*. Much was expected from this. Nothing whatever came of it, and the gendarmes soon returned to their homes, without even having had a glimpse of the man. Some time after, another attempt was made, but it was equally unsuccessful.

The *brigadier* at Morsiglia had received an anonymous note which informed him that Jacques Orlanducci had his usual hiding-place in an old ruined hut, the situation of which was very accurately described. It was in the middle of the Bois de Roscamone. Attracted by the sum of five hundred francs, the courageous *brigadier* decided to undertake the adventure.

Having let his men into the secret, he chose a moonless night, favourable to an ambush, and directed his steps towards the spot indicated. An agreeable surprise awaited him. He perceived, as he approached the ruined hut, that a small light, coming from a lighted fire, was visible through the apertures of the stones. No doubt that he had been correctly informed; Orlanducci was really there! With the greatest precaution the *brigadier* placed six men round the hut, and when all was ready, at a given signal, the attack was made. But Orlanducci was not there. The hut was completely empty.

A little oil-lamp was burning on the ground in the middle of the shelter, and under the lamp, a paper folded in four was found. It was opened; and this was what the discomfited gendarmes read:

'Brave soldiers, you thought to kill Orlanducci. Orlanducci, on the contrary, had you under fire, whilst you were traversing the Bois de Roscamone, a minute ago. He could have killed you; but Orlanducci respects your uniform. Go back to your barracks, brave soldiers, and never meddle again with Orlanducci's affairs.'

VI.

The man from Graté, during this time, led the life of a voluntary prisoner in the Bastia prison. Although he had the right to go out, he never did so, and one can understand why. He lived in his cell, and contented himself with the ordinary prison fare. His wife, however, taking advantage of any opportunity that offered, occasionally sent him some little luxuries. That is how, on a certain day in October, Rognoni received, in his prison, a basket of victuals which arrived from Graté. A traveller had brought it with him in the coach, and on his arrival had had it taken to Rognoni by a boy from the street. Delighted with the windfall, Rognoni generously gave him some sous, then opened the basket. It contained a Bologna sausage, two old cheeses, and a bottle of excellent Corsican brandy, which would have revived a dead man if he had been able to taste it. Deprived for a long time of good living, Rognoni set to work at once. He ate and drank copiously, but shortly after, shivering from head to foot, he was seized with most violent pains, his face being livid. The poor man quickly succumbed, and the body was found soon after, perfectly black and swollen. At the inquest it was discovered that the bottle of brandy contained a large proportion of the terribly poisonous juice of monk's-hood (aconite). Orlanducci had sent the bottle to the prisoner.

The next day the governor of the prison received the following letter: 'Rognoni has paid for the thirty francs he received for delivering Orlanducci to the gendarmes.'

It was after these events that the Procureur Impérial, absolutely furious, swore he would obtain Orlanducci's head at all costs. Justice demanded it, because the audacity of this bandit, in whom the whole of Corsica was interested, was a very pernicious example. It was clearly necessary for the law to have the last word.

A most rigorous search was made. Two companies of Light Infantry arrived at Ponte Nuovo, flanked by twelve brigades of Gendarmerie. Not a corner of the territory of Rostino had been overlooked. Arrests were made in suspected houses. All the inhabitants were under strict surveillance. For eight whole days the country was in a state of upheaval. All this

trouble was ineffective, and had no other results beyond the capture of a number of beggars, vagabonds, and bad characters. No trace of Orlanducci was to be found.

VII.

But whilst he was thus being vainly pursued in the district of Rostino, an extraordinary thing happened, quite near, which showed to everybody Orlanducci's true character. On 14th November, in broad daylight, a little troupe of armed men suddenly made an appearance in the village square of Quercitello, situated at about two hours' distance from the place where the gendarmes were searching. These men, numbering eleven, were sitting quietly on the stone seat which adorned the square, and the few inhabitants who were there at the time noticed with surprise that there was a woman amongst the band. Although she was dressed as a man, she was recognised by her two plaits of hair. In a minute the whole village was on the spot, and pronounced the name of Orlanducci. It was he, in fact. Very tall, distinguished-looking, he was standing up in the midst of the others. As the woman of Graté had said, he was wearing knee-breeches and a long coat of Royal blue, on which traces of stripes could be seen. He was very calm and collected. When a fairly large circle was formed around him, he raised his hat slightly and, addressing the nearest, said :

'The bandit Orlanducci made up his mind to pay a visit to your village. I know you are all honest folk and will not think of giving information to the gendarmes.' As no one replied, he added in a bantering tone, 'In any case, the gendarmes are not here. They are looking for me on the other side of the mountains.' He stopped, and then, pointing to a rather fine house, he asked, 'Whose house is that?' He was told it belonged to the Paolacci family, important people in the district. 'Then,' said Orlanducci, 'it wouldn't cost them much to offer us a glass of wine!' At these words, he made a sign to his men and they all trooped in.

Mr Paolacci could not do less than receive them, and when they were all seated, he hastened to serve them. Orlanducci begged him to drink a toast, and then made the following speech :

'These honourable gentlemen are brave bandits of the neighbourhood, who, attracted by the fame of my name, came to keep me company. When the gendarmes come to question you, you can tell them that we are not in want of anything.'

'I shall not forget to tell them,' replied Mr Paolacci, smiling.

'This wandering life has its charms,' continued Orlanducci ; 'in many ways it resembles war, which I like immensely.'

'But,' observed Mr Paolacci, 'I see there is a young woman with you ; this life cannot be good for her.'

'She is brave, and she wished it,' replied the

bandit gently. 'All the same, you are right ; it is not a life for a woman,' he concluded in a calm tone, looking at her affectionately. 'I am thinking seriously of settling down, now that our task is accomplished.' At these words he rose, and making a sign to his companions to rise, said, 'It is time to leave you, Mr Paolacci ; life has taught me that one must not trust everybody. Although the gendarmes are far away, prudence orders me to retire. Adieu, Mr Paolacci !'

He went out, followed by his men, crossed the village square, and was lost to sight in the chestnut wood, leaving the peaceful village in a state of indescribable excitement.

This was Orlanducci's last exploit. From that time no news was heard of him. Months passed away, and he would have been considered dead, had not the Procureur Impérial at Bastia received a letter. This letter was dated from Leghorn in Italy. It was in Orlanducci's own handwriting, and said :

'MONSIEUR LE PROCUREUR,—I have the honour to let you know that I have definitely left Corsica. The fact that my task was ended, and that my sister needed a more quiet life, forced me to seek a peaceful retreat. I am only travelling through Italy, and my footsteps are directed to far distant climes. I hope to live there as a good citizen. At the bottom of my heart, I never had any personal taste for the violent adventures which have just marked my life. I was a brave servant of my country, and I have always done my duty loyally. But circumstances have intervened ; blood had been shed in my family, and I was appealed to. The cowardly betrayers of my brother were pointed out to me peacefully enjoying the price of their guilt.

'My sense of justice was outraged, and the Corsican blood which runs in my veins began to boil, for my fourteen years of absence had not been enough to calm it.

'I started ; arrived in Corsica. A few months sufficed to accomplish my task. Now I sleep peacefully, and shall be able to lead a quiet life. Do not trouble any further about me, and do not let the gendarmes waste their time looking for me. Such brave men deserve to be considered. As for you, Monsieur le Procureur, I wish you well. You have not been good to me, but you were only doing your duty, and I do not bear you any malice. I bequeath to you our house at Graté ; do what you like with it, and accept my greetings. ORLANDUCCI.'

This was the last that was heard of Orlanducci. But his name was remembered for a long time, and his exploits were related at night by the village firesides.¹

¹ The facts of this story were found in a booklet entitled *Les causes judiciaires les plus célèbres de la Corse*.

THE RIVALS OF THE CRAGS.

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals, Tracks and Tracking, &c.*

L

'KRAWK!'

And across the craggy quietude the answer came like an echo—'Krawk!'

The ravens sat about eighty yards apart, each on a rocky pinnacle 400 feet up from the blue pine-wood and the blue loch nestling amidst it. For over an hour they had sat thus, croaking to each other at regular intervals, ticking it off like a funeral bell, till the men in the fishing-punt out on the loch had ceased to pay heed to the sound; or rather they heard it as they heard the persistent piping of the redshanks, the bubbling of the curlews, the drumming of the snipe, and the hundred other voices of spring-time in the hills. But to one of the men at any rate these sounds were full of melody.

Then something happened. One of the ravens fell head over heels from its perch, and tumbled twenty feet or more down the crag face, where it clung to the edge of a shelf, flapping wildly and croaking noisily. At the same instant there was a swish and a sound as of the beating of two strips of pasteboard together, and both men looked up to see—what they saw.

'Gee!' muttered the man with the oars, who last year had served an American gentleman. 'Yon was a close call!' and he grinned broadly.

The other, whose rod had become idle, knew not for what to look, and so had failed as yet to take in the situation. He saw the raven falling. He saw another bird flash past it into space, descending almost to the foot of the crags ere it could check the speed of its headlong stoop; then it rose vertically into clear relief against the sky.

'That,' said the fisherman quickly, 'is a peregrine falcon; isn't it, Sandy?' He had never seen one before.

The boatman removed his pipe and nodded. 'Scrapping with the ravens,' said he. Then, shading his eyes, he added, 'Watch ye the noo!'

For the second raven had descended from its perch, and was taking a short cut to meet the falcon as it rose. Taking a short cut, I say, yet when it got there, the falcon, mounting vertically, was a hundred feet above. Then the falcon

closed its wings and down it came like a stone, straight at its would-be aggressor.

The raven turned in the air to meet the assault claws upwards, his bayonet-bill presented, falling all the time, and both men saw that the peregrine checked his stoop within a yard. One could hear the terrific swish of his wings as he back-watered and shot off at a tangent, too wise to impale himself, even though in so doing he would most certainly have dislocated the neck of his opponent.

The first raven had recovered by now, and as the falcon swept across the crag face it went for him, and again there was a clatter of wings, while simultaneously a second falcon dropped sheer from the clouds and attempted to make a cannon. Both ravens flung themselves belly upwards, croaking wildly, as she swept from one to the next.

Truly now the stunt-flying had begun, and for five minutes or more the air rang with the clatter and swish of wings, though so far as one could judge there were no collisions in mid-air. Eventually each raven returned to its original look-out post, from which it refused to budge, merely ducking and presenting its bill when a falcon came swishing round. And so at length the peregrines, tiring of it, settled lightly as thistle-seeds on a gigantic outcrop midway between the two black-coated ruffians.

The angler remarked that he had never seen such flying in all his life. 'Nor did I know that a raven would stand up to a peregrine,' he added.

The boatman grunted. 'Yon impudent birds will stand up tae onything!' he muttered darkly. 'Even an eagle won't scare thae!'

'It was a very pretty match at any rate,' said the fisherman. 'What would have happened if the first raven hadn't seen the peregrine coming?'

The gillie smiled a wise and wizened smile. 'There's no' muckle a raven doesna see,' he remarked. 'But weel, if she hadna seen him, he'd have sent her heid spinnin' aff her shoulders!'

The fisherman smiled. 'I expect they both want the crag for nesting purposes,' he observed; 'and if one or the other is to have it, I hope it

will be the peregrines. One can see ravens, or rather their equivalent, any day in Rotten Row, but there are precious few falcons about.'

'An' if I had my way, sirr,' put in the boatman, 'there'd be fewer still! O' a' the destructive birds on a grouse-moor, yon are the worst. I've nae particular quarrel wi' the ravens; but peregrines——!' And he spat into the water.

The fisherman's face was a trifle disapproving. It was his first year as tenant of the big Highland estate, and though he had much to learn, he at any rate possessed the virtue of being anxious to learn it.

'Well, see here, Sandy,' said he. 'Neither the peregrines nor the ravens are to be disturbed, so you can hand those orders on to the gillies and all the other boys. I'll be interested to see what comes out of this.'

Sandy gave a surly nod. 'I'll no' need tae tell anyone,' said he. 'Thae falcons and thae ravens are as safe as the Bank o' Scotland up there. No one can get within gun-shot o' them.'

There was a pause; then, as nothing happened, the tenant pursued, 'Who do you reckon will get the crag, Sandy—the ravens or the peregrines?'

'The twae o' them, sirr,' replied Sandy unhesitatingly. 'Every spring since I was a wean thae falcons and thae ravens have nested in thae rocks. Every year they've fought for it like we've jist seen, and every year there's been a guid hatchin' o' both the varmint. Wait till the shootin' season, sirr, and ye'll no' hae muckle good to say aboot thae falcons!'

'Perhaps not,' the tenant agreed; 'but I'm quite prepared to forgo a few brace of grouse and wild duck in order to see such exhibitions of stunt-flying as we have seen to-day. If the nesting affairs of those birds are interfered with, Sandy, there'll be the very dickens of a row!'

II.

So the word went forth that the new tenant was one of those sentimentalists who cannot leave the preservation of his moor to those whom he pays to undertake it. Now, though Sandy was right in saying that the crag was inaccessible, he had omitted to mention the fact that he and his colleagues were in the habit of shooting and trapping the young falcons soon after they could fly. That kind of vandalism was to be stayed this year, and meantime the tenant, fishing the loch daily, often rested his rod to watch a fresh outburst of the feud, while Sandy regaled him with stories of the falcon's destructiveness, and of the sinful wastage of allowing such birds to remain on the hill.

'But, Sandy,' the tenant pointed out, 'they are at any rate protected by the law of the land.'

At which Sandy waxed eloquent as concerned the fools who frame the law.

As time passed it seemed to the fisherman that the stoops of the falcons and the stabs of the ravens lost much of their venom. In that first encounter he had witnessed each was clearly intent on shattering the other lifeless, but now it seemed that they were coming to regard each other in a different light, and their assaults were more by way of friendly buffetings.

The ravens had repaired their ancestral eyrie, and the peregrines had scraped out a hollow in the peat under the great overhang of rock, where the hen bird was busy with her own affairs, for one saw little of her. The tercel, who was smaller and more beautiful than his mate, was always on guard, sitting bolt upright on his look-out tower, while forty or fifty yards away, croaking occasionally, sat the male raven. Whenever the raven rose a-wing, the falcon would rise to buffet him; but, as the fisherman remarked, it seemed to have become a bachelor joke more than anything else.

One day Sandy and the tenant were out on the moor taking stock of the young birds, when they saw a thing which gave the old gillie the chance for which he had waited. A particularly strong covey of young grouse rose from the heather at their feet and went rattling down the slope, when—swish!—Milord in blue came down from the clouds in one headlong nose-dive. The covey split up like the bursting of a hand grenade, but so terrific was the speed of the falcon that they seemed to be motionless in the air. He overhauled them as a greyhound might overhaul a herd of swine, and before the very eyes of the onlookers, four young grouse were sent spinning into the heather in the twinkling of an eye. Then the falcon volplaned and cork-screwed back into the clouds, screaming savagely the while, but never even looking round to see what he had done.

'There ye are, sirr!' cried Sandy. 'What did I tell ye, sirr?' He was red to the roots of his red hair, his sandy moustache bristling like a tooth-brush; but now to his bewilderment he saw a look of rapt admiration and silent joy on the face of his employer.

'Grand!' the tenant muttered softly. 'Sandy, I never saw anything so neatly done in all my life, and if we do not kill a single bird this season, I have already had my money's worth out of the moor.'

Sandy glared. He simply did not understand. Such a spirit was beyond the comprehension of his materialistic mind. He thought over it solemnly and deeply for ten minutes or more, then eventually he said, 'Weel, if that's what ye pay your money for, sirr, it's no affair o' mine. But why rent a grouse moor tae see it? Why no' save your money and go for a walk in the deer forests where peregrines can dae what they like? It seems tae me an unco' wastage o' guid money.'

For this the tenant had no answer. Money

did not concern him greatly, but this he knew—that every day he was getting his money's worth, whether or not he was following what some might consider the orthodox rules. He knew also that Sandy was a good keeper, and he liked the man none the less for his abrupt speech and for his enthusiasm for the cause. 'Some day,' he said, 'we shall be seeing eye to eye, and I shall have you, Sandy, regarding the peregrines as every bit as sacred as your own sacred red birds.'

Sandy stubbornly shook his red head. 'Niver!' said he. 'Niver sae long as I live will ye find me preserving thae varmint!' And for the rest of the way he chose to walk twelve paces behind his master.

III.

The nesting season was well advanced when the two men, from their usual outlook across the water, saw one of the strangest little dramas of wild nature that man has been favoured to look upon. The young ravens and the young peregrines were hatched now, and on still days the men could distinctly hear the down-covered falcon chicks squealing to their parents when food was brought them.

Watching through the glasses, the new tenant spent many a fascinating hour observing the home affairs of these people of the crags, and the ways of the falcons were specially pretty. Suddenly the tercel would appear over the brow of the cliff, carrying something in his talons, and as he hung a moment like some beautiful silver thing suspended from the clouds, his wild and yet not unmusical note would ring out. Then the head and shoulders of his mate would appear from under the crag far below, and, wheeling in his flight, the tercel would toss to her the thing he carried. Down it would drop, a mere heap of crumpled feathers, till the hen bird shot forth from the eyrie and caught it lightly in mid-descent. Sometimes too the falcons, buffeting each other as they flew, would mount to the topmost heavens, there to wheel and glide, the merest specks amidst the infinite, till one, then the other, would close its wings and fall—down, down, larger yet larger, till it seemed assuredly that they would pulp themselves among the crags. Truly they were very lovely things, and their mastery of the air was a manifold wonder to behold. Even Sandy's eyes brightened at times when he watched them, and he would mutter reluctantly, 'Eh, that's bonny flyin', very bonny!'

But one soft, sunlit evening, I say, a strange thing happened. On hearing the familiar 'kree,' the sepulchral croak, and the clatter of wings, both men looked up, expecting to see the birds which had never yet satisfactorily settled the true ownership of the crag going at each other hammer and tongs, in the hope of arriving at a belated conclusion. But at first they were

mystified. Certainly the four birds seemed to be mixed up together, but they kept to one portion of the crag—to a narrowing of the shelf within a few feet of the peregrines' eyrie. Were the ravens striving to reach the young falcons? Surely not! One rule both parties had strictly observed throughout—that neither ventured within a certain prescribed line of the nest of the other.

'It seems tae me they're mobbing something,' Sandy remarked. And next moment it became clear that this indeed was the case, for both men saw some large animal detach itself from the *mêlée* and go bounding from shelf to shelf in a frantic effort to reach easier travelling; but the peregrines closed at once, and hard behind them, backing them up, the ravens.

'Got your glasses on her, sirr?' demanded Sandy with unusual animation.

'Yes. Here, take them. It's a wild cat, a pukka wild cat, big as a panther!'

Next moment Sandy had the glasses adjusted, and pronounced that conclusion to be correct. They watched, breathless, to see the finish of the fight, if there was to be a finish. The cat had evidently heard the young falcons screaming, and had taken her life in her hands in deciding to attempt to rob the eyrie. Now she had brought a veritable hornets' nest about her ears, for the ravens had joined the peregrines, and were just as intent on teaching that wild cat what she was up against.

Yes, side by side at length, the world-old feud at last forgotten, the ravens and the falcons confronted a common foe, and as the men watched they heard a hissing scream, they saw the wild cat clutch wildly at the edge of the shelf, then at a stab from one of the ravens she lost her hold and fell. So they saw her strike and spin, then down into the purple shadows, with both falcons in close attendance, as though to see that she landed safely, she hurtled.

On a boulder, nearer than the men had ever seen them before, within twenty feet of the pine needles, the peregrines alighted, to be joined by the ravens, and there, in the slanting evening light, they spread their wings and seemed to converse with one another, as though each was congratulating the rest on the valuable part they had played. The men could distinctly see the royal blue of the tercel, touched with kingly ermine, the softer but no less lovely shades of his mate, and the wonderful purple and green of the ravens' garb. Amidst that rugged setting, with the blue sky above and the feathery pines around, it presented a picture such as few men have looked upon, and on the tenant's face there was an expression of quiet wonderment. 'Wild Nature as God made it!' he muttered almost reverently.

The gillie nodded. 'One might live a long, long time, sirr,' said he, 'and never again witness the like o' that.'

Later, when the falcons and the ravens had returned to their family affairs, both men ascended the rocky slope to see if they could find the wild cat. They found her all right. She lay quite dead at the foot of the cliff, and as well for her too, for had she escaped from the crag she would have gone her way sightless.

IV.

A little while later the tenant was indisposed, and after some days had elapsed he sent for the head gillie. 'Sandy,' said he, 'the doctors sent me here because they thought it would set me right among the pine forests.' And he patted his chest significantly.

Sandy nodded, and for once the gray eyes were sympathetic under their shaggy brows. 'I guessed as much, sirr,' he said quietly.

'Well,' the tenant pursued, 'that scheme has failed, and now they are sending me a few thousand miles away on another wild-geese-chase. I don't suppose I shall come back, Sandy, but I have learnt to love this place with its torrents and its crags, so I have bought it all for my boy. He is too young yet to handle a gun, but I want him to learn. You will teach him, Sandy, and I want you to teach him well. I want you to teach him to love

every wild thing as God made it, and I want this to be an unspoilt range. I want the crags to be bird sanctuaries just as they were a thousand years ago, so that my boy can learn wild nature as the Creator made it, before man stepped in to upset the balance. That is what I have loved, Sandy, and believe me, it is the only kind of preservation worth while. I know in my heart that you will keep good faith.'

Sandy's eyes were downcast. 'If that's your wish, sirr,' said he, 'I'll devote my life to it.'

The tenant stretched out his hand, and for a moment they looked into each other's eyes, the one with his face still towards the day, the other with his face towards the sunset.

'That is all, Sandy,' said the tenant. 'You will like my boy when you see him. He's what you would call a "braw wee laddie."'

Old Sandy took the hand. His own was trembling, and his vision was dim. 'Knowing his father,' said he, 'I'll like him weel, aye weel.' And Sandy went his heavy-hearted, heavy-footed way.

So there came into existence one of Scotland's few bird sanctuaries, and the grizzled keeper of the gate keeps his hand upon the key.

PETER WAS SINGLE.

PART IV.

XIII.

PETER was all expectation, and the chill atmosphere of the compartment of which he was the only occupant troubled him but little. Indeed, the single feature about the train which succeeded in impressing itself upon his consciousness with any emphasis was its sluggishness of movement. For the twentieth time during what was really a very short journey, he rose impatiently and crossed to the other window, and then sat down again. The compartment had not been constructed to meet the requirements of nervous passengers who desired to perambulate. The journey, he knew, was supposed to take a little more than thirty minutes to complete, and if the train was running to schedule the moment he had been living for ever since Thursday was close at hand.

Miss Slade had not put in an appearance at the warehouse since that fateful Wednesday, and although it was nothing new for her to be away for two or three days at a time, the imaginative Peter tortured himself with all sorts of fantastic fears and doubts. Suppose something really terrible had happened to her? Suppose she were seriously ill and unable to keep her appointment, how was he to find her? During the previous day he had attempted,

in a painfully casual manner, to discover if any of his staff knew Miss Slade's address, but no one had any but the vaguest idea as to her exact whereabouts. He had even considered the advisability of going boldly down to the private office and asking for her address, but such an action would be sure to cause comment, and he shrank from doing anything which would be likely to cause her unpleasantness in the slightest degree. She was, he knew, extremely sensitive; also beneath his fears and doubts was a certain conviction that she would be waiting for him.

'Anyhow,' muttered Peter grimly, 'I sha'n't return until I've seen her.' The very thought of not seeing her was unbearable.

There now came that change in the rhythm of the grinding wheels beneath him which always precedes a stop, and Peter perceived that the train was drawing into a little station. His heart bounded into his throat as a sign-board, almost as big as the station itself it seemed, bearing in great white letters on a black ground the name of his destination, flashed past. He sprang eagerly to the window, lowered it, and gazed out along the platform.

She was waiting for him—a slim, dark, lonely figure. Peter finished the rest of his journey on the footboard, dropping off immediately he drew level with her.

'So you came,' she said softly; 'you came to me.'

His emotion was so deep that Peter was unable to answer. Without another word she linked a confiding arm in his, and they made their way from the station.

It was a cold, sharp evening, made palely luminous by a wintry moon which gave familiar objects a strange air of unreality and flung gigantic shadows across their path. From the station they turned into a lonely suburban road, which at first ran between rows of imposing semi-detached villas; soon these dark, silent buildings became less frequent, until, finally, there were fields on either side of them and fields in front of them. The road had now become a wide, unpaved lane. Peter's sense of unreality increased. He had an odd feeling that, at every next step, he would waken to find himself back in the warehouse. Peter did not want to waken.

'How different from the warehouse,' murmured his companion softly.

Peter nodded and sighed.

'I love the country, only——'

'Yes?'

'Only I miss the birds—how I would have liked to hear the birds twittering this night.'

The moonlight became stronger and clearer; their feet rang on the hard path which ran like a ribbon through lonely fields, over which the keen hoar frost was spreading a magic mantle of jewelled white. On and on they went, saying but little, completely happy to be near each other. Peter's sense of unreality deepened with every step they took. The girl at his side seemed not to be of this world, and he felt that he must soon lose her. When she looked up at him, as she did often and strangely, the bright moonlight touched her face with an ethereal beauty. She led the way along all manner of queer little paths and over all manner of queer little stiles and fences. Peter soon discovered that there was a method in her apparently aimless rambling. From her little whispered comments it became quite obvious that childhood memories made these places dear to her.

They must have been walking for more than an hour when Peter decided that the time had come to broach the subject nearest his heart. The path sloped gently downward into a shallow valley where, less than half a mile away, he saw, clearly, the dark outline of a lonely little church. . . . He spoke in a whisper.

She answered in a whisper. 'I will give you my answer when we reach the church.'

XIV.

The church was in complete darkness, and there was no outward indication to show that anyone had remained behind after the service. The building was ancient and, judging from the

condition of the low wall which surrounded it, badly in need of repair. They turned in at the open gateway and passed down a moss-grown path, at each side of which crumbling grave-stones rose in the moonlight like silent sentinels. Passing into the dark shadow of the building, the girl led the way to a secluded corner of the graveyard, and at one of the graves she stopped with bowed head. 'Peter,' she whispered, 'my mother lies here. She would have liked you.'

Peter removed his hat and, looking down, saw at his feet a mass of simple flowers, still fresh, and evidently placed here by the girl earlier in the day.

She sank to her knees. 'Oh, mother, I am near you now, very near.'

Suddenly she buried her face in her hands and fell forward, sobbing, across the mound. Throwing his hat down, Peter raised the girl to her feet with an ease which surprised him, for she was nearly as tall as he.

A silence fell between them, and then at last the girl spoke. 'My mother was consumptive,' she said at last, mastering her emotion with a great effort, 'but she was very happy until my father died. I was very young then and do not remember him. My mother was obliged to work in the city; you see she had to provide for me, and it killed her. I—I——' She ceased and looked at him appealingly. Peter drew a deep breath; he knew what was coming now. 'Oh, Peter, I have inherited her disease. There is no doubt, almost no hope. The specialist I went to see the day after our evening together was quite honest with me. Try to forgive me for keeping silent so long. I did so hope that I might be mistaken. You—you meant so much to me, and I could not bring myself to tell you until I knew there was no hope. You do not blame me for not telling you; do you, dear? Say that you forgive me!'

He took her gently by the shoulders. 'I am still waiting for your answer,' he said steadily. 'Will you marry me at once and give me the privilege of taking care of you?'

She drew away from him with a cry of pain. 'But, my dear, you—you don't understand. They are coming for me shortly—taking me away. I shall never go to the warehouse again; this is the last time we shall ever see each other—the very last time.'

Peter shook his head stubbornly. 'It is not true—it can't be true,' he answered; 'while there's life there's hope. At least I can come and see you every week.'

She shook her head, and the moonlight fell full on her face, washing away the deceptive colour and touching her features with a strange ethereal beauty, not, it seemed to Peter, of this world. Even in her own great misery she thought of him rather than herself.

'You cannot, dear. They are taking me too far away for that, and it is better so. You have

your life to live, and you must forget me as soon as possible, or at least only remember me as one whose sad life was made happier by touching yours for a moment. . . . They say that in this life we are watched over by the

spirits of those who loved us. . . . Well, if in the years to come you should pass this way again, think of one who loved you and who is watching over you always. . . .

(Continued on page 139.)

VENETIAN PALACES.

By E. BERESFORD CHANCELLOR.

I.

WHEN Philippe de Comines was in Venice, on a diplomatic mission, in the year 1494, he was specially struck by the palaces, 'very high and of good stone; the ancient ones all painted,' which he observed as he was carried along the Grand Canal on his entrance to 'the most triumphant city' he confesses ever to have seen. To-day the visitor cannot but be equally impressed by the long series of famous and beautiful houses which line Venice's chief water-way, and form so many links in the chain of her historic past. The annals of Venice may be read in the bricks and stones of her *palazzi* as clearly as in her written records. Their picturesque names recall the great families who have directed the destinies of her arms and commerce.

As we pass up and down the Grand Canal on which so many of them look—and seem to look so wistfully—we cannot but be moved by the air of past grandeur which they exhibit as they stand, the memorials of a by-gone age and a long-dead convention. Something of this effect is produced by the great châteaux of France, whose significance passed with the mighty upheaval of a down-trodden people. But in that case the desolation wrought was produced by a sudden mighty uprising, although its seed had been sown through many a generation. Here in Venice the result has been produced by a gradual, an almost imperceptible, development. Time and changed conditions have alike eaten out the core of these once princely and noble abodes. No sudden outburst of popular fury has defaced their façades or played havoc with their splendid decorations. They have merely outlived their uses and significance, and where once abode a powerful noble is now a collocation of rather dilapidated tenements; where once some resplendent Doge dwelt is, to-day, the establishment of an antique-furniture dealer whose name, as it exhibits itself on a be-coroneted front, ill accords with the once proud annals of the family which formerly possessed it. But one thing time and change have been unable altogether to destroy. The architectural features which the fourteenth, fifteenth, and sixteenth centuries lavished on these buildings still remain

more or less intact. Indeed, from an artistic point of view, time has helped to soften and mature so much that it may almost be forgiven if, in other cases, it has laid its destroying hand too roughly on a frescoed front, or has shorn away the initial sharpness of some delicate tracery, some decoration wrought in a stout lace-work very lovely to an appreciative eye.

II.

There must be not fewer than sixty or seventy of these palaces on the Grand Canal alone. Their façades help to make this serpentine water-way, with its glorious curves and almost theatrical effect, the most fascinating of all existing streets. Those who stay in Venice beyond the few days which many tourists seem to think sufficient time in which to master the intricacies, and sate themselves with the wonders of the place, come to know these landmarks, which no familiarity can make other than ever more and more alluring.

As your gondola carries you slowly past these homes of dead hopes and ambitions, the gondolier will draw your attention to this or that palace, and will call out historic names with which famous names of our own day are intermingled: here a Contarini lived, or a Grimani; there stayed Richard Wagner, and there died Robert Browning.

It is all slightly bewildering; but after all it is the essential and marked characteristic—this mixture of the old and new—of Venice. For just as the great poet and musician come into intimate contact with the protagonists of a past time, so do the *vaporetti* and motor launches stir up the waters on which the gondolas and *sandolos* ride lightly as they rode when Loredano and Foscari were Doges; while cinemas penetrate into *calle* and *campi* through which the members of the Council of Ten must often have passed, their robes of Tyrian hue reflecting the sun's rays as do, to-day, the dresses of the young American and English girls who feed the pigeons in the Piazza, or eat ices at Florian's.

III.

In old days the Venetian did not call his home a palace, as has since become the custom. With him it was *Cà*, a shortened form of *Casa*, and there exists one of the loveliest of these old

buildings bearing the original name—I mean the Cà d'Oro. There is no doubt that this is the most exquisite of all the buildings on the Grand Canal—perhaps, one might say, in all Venice. It is known to have been built, between the years 1424 and 1430, for the Contarini family, who seem to have possessed many other palaces (there are at least four more on the Grand Canal known by their name), although none that could compare with this architectural gem. It was called d'Oro, because its front was originally richly gilded, and not, as has sometimes been stated, from the Doro family, with whom it had no connection. The contracts for its elaborate stone-work and for its decoration in gold and vermilion are still in existence. Ruskin has waxed eloquent, as well he might, over the delicate beauty of its façade, which once seen can never wholly be forgotten. In its chapel is one of Mantegna's last pictures—a St Sebastian, and once the place was inhabited by Taglioni; but its essential beauty is such that it requires not even the pencil of the great painter or the pirouetting of the great dancer to give it interest or add to its charm.

Another beautiful frontage is that belonging to the Palazzo Loredan, the home once of the famous Doge, whose portrait, by Giovanni Bellini, is one of the treasures of the National Gallery, and who became head of the State in 1501, and ruled ably for twenty years. It stands near the Rialto Bridge, and, indeed, stood there before the present stone structure was erected; for it was built during the twelfth century, probably about the time when the first wooden bridge took the place of a bridge of boats at this spot. Although it has been restored, once at least in Gothic times, and once in the days of the Renaissance, it preserves the form its Byzantine builders gave it. The arms over some of its windows are those of Peter V., King of Cyprus, who once stayed here as the guest of Federigo Corner Piscopia; and in one of its rooms the child who was to become the learned Elena Cornara Piscopia was born.

IV.

To give in any detail the history of Venice palaces would mean the writing, not of an article, but of a volume; properly to consider their architectural features would entail another. As one passes down the Grand Canal from the Dogana, one can but point out those which, from their associations or the beauty of their façades, or from both, are best worth noting.

The first that will thus strike the eye is the Palazzo Dario. This is situated on our left, and is noticeable on account of the discs of porphyry and serpentine which decorate its front. It was erected during the middle of the fifteenth century, and is a good example of the Lombardi style of architecture, looking much as it must have done when De Comines saw it.

A little farther on is the Palazzo Manzoni, of about the same, or a very slightly later, date, and also the work of one of the Lombardi, that noted family to whom are due so many of Venice's lovely buildings. Beyond the Accademia stand the twin Palazzi Contarini degli Scignini, one of which is Gothic of the fifteenth century; the other later, probably from the hand of Scamozzi, a notable contemporary of the more widely-known Palladio. Degli Scignini signifies 'of the money chests'; and the addition is said to have been popularly applied to those palaces on account of the wealth of the powerful Contarini family which once possessed them, and which gave no fewer than eight Doges to Venice. Slightly farther on we come to a very different kind of palace, one whose fame is rather with its nineteenth-century resident than with the family for whom it was erected. This is the Palazzo Rezzonico, where Robert Browning spent some of his later years, and where, on 12th December 1889, he died. A tablet on the side of the building commemorates the fact; below being the poet's lines:

Open my heart, and you will see
Graved inside of it, 'Italy.'

The world knows the Palazzo Rezzonico better from this fact than because it was originally built (in 1680) for the Rezzonico family by Longhena, the architect of S. Maria della Salute, or because Joseph II. of Austria was once sumptuously entertained within its walls. It is an immense structure in the rather heavy decorated style which characterised Longhena's work; and had not Browning's one-time presence hallowed it, we should, perhaps, have given it but a passing glance. For next to it come three far lovelier façades belonging to what was once the great home of the Giustiniani family; they date from the fifteenth century, and one of them is called 'dei Vescovi' from the patriarch saint who was a member of this clan. The third of these palaces was purchased, in 1437, by Francesco Foscari (he was Doge from 1423 to 1457), and goes by his name. The pathetic story of Doge Foscari, known to so many through Byron's play, is indissolubly associated with this beautiful structure; for it must have been in it that he suddenly burst a blood-vessel on learning the decision of the Council of Ten that the tears wrung from him by his son's fate were regarded as indicative of his imbecility and inability to carry on his functions as Doge. You may see the old man's bust, 'looking as if he were alive,' in the ducal palace, and can almost imagine yourself present at the scene when Loredano carried the cruel message to his enemy.

Farther on is the Palazzo Balbi, whence Napoleon once watched a regatta organised in his honour in 1807; and close by is the Palazzo

Grimani, dating from 1475-85, with its remarkable column-capitals. But the Palazzo Pisani beyond will attract our notice chiefly, at this point, because of the beauty of its fifteenth-century transitional architecture, and also because it once contained Veronese's 'Family of Darius,' which, before the Pacca Law prevented such things, was carried away and sold to our National Gallery for £13,500 in the year 1857. A neighbouring palace, that of Cappello-Layard, has also a connection with art, in our minds, for here lived for many years Sir Henry Layard, whose remarkable gallery contained, among so many riches, the famous portrait of the Sultan Mahomet II. which Gentile Bellini painted during his sojourn in Constantinople.

v.

Passing by two palaces to which Ruskin in his *Stones of Venice* gives the names of 'The Braided House' and 'The Terraced House,' and which deserve careful study, although we cannot give it them here, we come to the Rialto Bridge, and close by it the Palazzo dei Camerlenghi, otherwise the offices of the three Lords of the Treasury, erected in 1525 by Guglielmo Bergamasco, and once decorated with pictures by that somewhat illusive and mysterious painter, Bonifazio. This palace, unlike those already mentioned, has always possessed a public rather than a private character. The Palazzo Corner della Regina, to-day the municipal pawn office—Venice's *mont-de-piété*—takes its name from the fact that it is built on ground once occupied by the palace allotted to Caterina Cornaro, Queen of Cyprus, on her abdication. She left it by will to the Pope, by whom it was given to the Counts of Cavanis. The present building was designed by Giacomo Rossi, and was erected in 1724.

On the western side of the canal only two other palaces need be noticed, not because of the charm, but rather of the bulk, of their design. They were both the work of the heavy-handed Longhena—a sort of Venetian Vanbrugh. The first is the Palazzo Pesaro, built in 1679. Ruskin describes it as 'the most impressive in effect of all the palaces of the grotesque Renaissance'; but Fergusson is full of praise for its general outlines, although he confesses that slight irregularities of detail are present. The fact is, these large, heavy erections, excellent as they often are in fulfilling architectural requirements, yet strike an alien note when seen in juxtaposition to the charm of the Gothic and earlier Renaissance buildings which stand near them. This is markedly the case with another of Longhena's huge buildings, the Palazzo Battaglia, whose façade is spoilt by two obelisks rising at each corner, and which appears vulgar and commonplace beside the lonely Cà d'Oro, whose traceried beauty rises close by.

vi.

Our return on the other side of the Canal may well be commenced at this charming and lovely palace to which I have already referred. Passing it, we see another Gothic building, though on far less elaborate lines, the Palazzo Sagredo, now the Rava College, which dates from the thirteenth century, but which has undergone many subsequent alterations. Farther on, just beyond the Rialto Bridge, is the Palazzo Manin, a work of Sansovino, which reminds us of Venice's last Doge, a member of the family from whom the structure takes its name; and near by, after passing the fifteenth-century Palazzo Bembo, is the small relic of what was once the home of a much earlier and far more notable Doge—Enrico Dandolo. It dates from the twelfth century, as does the beautiful Palazzo Loredan already referred to.

Although the Palazzo Dandolo is associated with the Doge who ruled the destinies of Venice with such conspicuous success from 1193 to 1205, an inscription on another residence, now used as the *Municipio*, and known as the Palazzo Faretto, tells us that that building was originally erected by Enrico Dandolo in the year 1203. There is an added interest associated with this palace, because here was established the academy in which Canova learned the rudiments of his art, and it still contains evidences of his skill in some carvings on the great staircase.

For a very different reason the Palazzo Grimani will attract attention, for it is one of Sanmicheli's great achievements in this style of domestic architecture, and forms a link between the earlier work exhibited in the Dandolo and Loredan palaces (the Palazzo Corner-Spinelli close by, designed by Pietro Lombardi, is more or less contemporaneous) and the Palazzo Mocenigo, whose rich and elaborate frontage soon arrests the eye. Here the Duke of Savoy stayed in 1574, and here Giordano Bruno was denounced as a heretic in 1592, with the result that that famous philosopher perished at the stake, in Rome, some years later. It was here, too, that Byron stayed during his residence in Venice, and here he wrote portions of *Don Juan*, *Marino Faliero*, and *Beppo*. Many of the weird and exaggerated stories set afloat concerning the poet had for their *milieu* this old and attractive palace.

Before we emerge into the basin of S. Marco, where to-day war-ships and giant liners ride at anchor, and gondolas and motor-boats mark the extremes of Venice's water-power, there are various palaces, all of which possess some appealing note. For instance, that of Contarini delle Figure, with its shield and trophy decorations, which report says is haunted, mysterious knockings being heard and doors being seen to open by themselves, as a result of its one-time

owner having gambled away not only all his worldly possessions, but at last even his wife; the Palazzo Cavalli, of the fifteenth century, once belonging to the Comte de Chambord; the Palazzo Corner della Cà Grande, built by Sansovino; and the earlier Palazzo Contarini-Fasan, with its charming little front, popularly supposed to have been the home of Desdemona. Coryat, in 1608, specially mentions its 'pretty little turned pillars of marble,' and Ruskin regarded it as 'the richest work of the fifteenth-century domestic Gothic in Venice.'

Nothing, I think, can equal the catholic beauty of these Venetian palaces. All architectural tastes can be satisfied in their progress

up and down the Grand Canal. The rounded arched windows of the Byzantine convention, the glorious traceried work of the Gothic and earlier Renaissance, the imposing richness of the later period, and the massive solidity which marked the Baroque, are all represented. And, withal, a background of history and romance: memories of great Doges, illustrious princes, and famous men and women who have succumbed to the fascination of Venice, and who, like Byron and Browning, George Sand and George Eliot, Chopin and Wagner, have passed some of their time inhaling its influence and in perpetuating something of its incommunicable charm in the terms of their various arts.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER IV.—*continued.*

'I WAS on my way to see your father,' said Mr Bandicott at length. 'This morning I have prospected the barrow of Harald Blacktooth, and it is clear to me that I can make no progress unless I have Colonel Raden's permission to use explosives. Only the very slightest use, I promise you. I have located, I think, the ceremonial entrance, but it is blocked with boulders which it would take a gang of navvies to raise with crowbars. A discreet application of dynamite would do the work in half-an-hour. I cannot think that Colonel Raden would object to my using it when I encounter such obstacles. I assure you it will not spoil the look of the barrow.'

'I'm sure papa will be delighted. You're certain the noise won't frighten the deer? You know the Piper's Ring is in the forest.'

'Not in the least, my dear young lady. The report will be very slight, scarcely louder than a rifle shot. I ought to tell you that I am an old hand at explosives, for in my young days I mined in Colorado, and recently I have employed them in my Alaskan researches—'

'If we go home now,' said Janet, rising, 'we'll just catch papa before he goes out. You're very warm, Mr Bandicott, and I think you would be the better for a rest and a drink.'

'I certainly should, my dear. I was so eager to begin that I bolted my breakfast, and started off before Junius was ready. He proposes to meet me here.'

Benjie, left alone, wrought diligently at his heather roots, whistling softly to himself, and every now and then raising his head to scan the haugh and the lower glen. Presently a tall young man appeared, who was identified as the younger American, and who was duly directed to follow his father to the Castle. The two returned in a little, accompanied by Agatha Raden, and while the elder Mr Bandicott hastened to the Piper's Ring, the young people

sauntered to the Raden bridge and appeared to be deep in converse. 'Thae twa's weel agreed,' was Benjie's comment. A little before one o'clock the party adjourned to the Castle, presumably for luncheon, and Benjie, whose noon-tide meal was always sparing, nibbled a crust of bread and a rind of cheese. In the afternoon Macpherson and one of the gillies strolled past, and the head-stalker proved wonderfully gracious, and adjured him, as Janet had done, to keep his eyes open and report the presence of any stranger. 'There'll be the three folk from Strathlarrig howkin' awa' there, but if you see anybody else, away up to the house and tell the wife. They'll no' be here for any good.' Benjie promised fervently. 'I've graund een, Mr Macpherson, sir, and though they was to be crawlin' like a serpent I'd be on them.' The head-stalker observed that he was a 'gleg one,' and went his ways.

Despite his industry Benjie was remarkably observant that day, but he was not looking for poachers. He had suddenly developed an acute interest in the deer. His unaided eyes were as good as the ordinary man's telescope, and he kept a keen watch on the fringes of the great birch woods. The excavation at the Piper's Ring kept away any beasts from the east side of the haugh, but on the west bank of the stream he saw two lots of hinds grazing, with one or two young stags among them, and even on the east bank, close in to the edge of the river, he saw hinds with calves. He concluded that on the fringes of the Raden the feeding must be extra good, and as a steady west wind was blowing, the deer there would not be alarmed by Mr Bandicott's quest. Just after he had finished his bread and cheese Benjie was rewarded with the spectacle of a hummel, a great fellow of fully twenty stone, who rolled in a peat-hole and then stood blowing in the shallow water, as unconcerned as if he had been on the

top of Carnmore. Later in the afternoon he saw a good ten-pointer in the same place, and a little later an eight-pointer with a damaged horn. He concluded that that particular hag was a favourite mud-bath for stags, and that with the wind in the west it was no way interfered with by the activities at the Piper's Ring.

About four o'clock Benjie backed the old horse into the shafts, and jogged up the beech-avenue to Mrs Macpherson's, where he was stayed with tea and scones. There was a gathering outside the door of Macpherson himself and the two gillies, and a strange excitement seemed to have fallen on that stolid community. Benjie could not avoid—indeed I am not sure that he tried to avoid—hearing scraps of their talk. 'I've been a'round Carnmore,' said Alan, 'and I seen some fine beasts. They're mostly in a howe atween the two tops, and a man at the Gray Beallach could keep an eye on all the good ground.' 'Ay, but there's the Carn Moss, and the burnheads—there will be beasts there too,' said James Macrae. 'There will have to be a man there, for him at the Gray Beallach wouldna ken what was happening.' 'And what about Corrie Gall?' asked Macpherson fiercely. 'Ye canna post men on Carnmore—they will have to keep moving, it is that awful broken ground.' 'Well, there's you and me and James,' said Alan, 'and there's himself.' 'And that's the lot of us, and every man wanted,' said Macpherson. 'It's what I was always saying—ye will need every man for Carnmore, and must let Carnbeg alone, or ye can watch Carnbeg and not go near Carnmore. We're far ower few.' 'I wass thinking,' said James Macrae, 'that the youngest leddy might be watching Carnbeg.' 'Ay, James'—this satirically from Macpherson—'and how would the young leddy be keeping a wild man from killing a stag and getting him away?' 'Deed, I don't know,' said the puzzled James, 'without she took a gun with her and had a shot at him.'

Benjie drove quietly to Inverlarrig for his supply of fish, and did not return to his headquarters in the Wood of Larrigmore till nearly seven o'clock. At eight, having cooked and eaten his supper, he made a simple toilet, which consisted in washing the fish-scales and the stains of peat from his hands, holding his head in the river, parting his damp hair with a broken comb, and putting over his shoulders a waterproof cape, which had dropped from some passing conveyance and had been found by him on the road. Thus accoutred, he crossed the river and by devious paths ascended to Crask.

He ensconced himself in the stable, where he was greeted sourly by the Bluidy Mackenzie, who was tied up in one of the stalls. There he occupied himself in whistling strathspeys, and stuffing a foul clay pipe with the stump of a cigar which he had picked up in the yard. Benjie smoked not for pleasure, but from a

sense of duty, and a few whiffs were all he could manage with comfort. The gloaming had fallen before he heard his name called, and Wattie Lithgow appeared. 'Ye're there, ye monkey! The gentlemen are askin' for ye. Quick and follow me. They're in an awfu' ill key the nicht, and maunna be keepit waitin'.'

There certainly seemed trouble in the smoking-room when Benjie was ushered in. Lamancha was standing on the hearth-rug with a letter crumpled in his hand, and Sir Archie, waving another missive, was excitedly confronting him. The other two sat in arm-chairs with an air of protest and dejection. 'I forgot all about the infernal thing till I got Montgomery's letter. The 4th of September! Hang it, my assault on old Claybody is timed to start on the 5th. How on earth can I get to Muirtown and back, and deliver a speech, and be ready for the 5th? Besides, it betrays my presence in this part of the world. It simply can't be done . . . and yet I don't know how on earth to get out of it? Apparently the thing was arranged months ago.'

'You're for it all right, my son,' cried Sir Archie, 'and so am I. Here's the beastly announcement. "*A Great Conservative Gathering will be held in the Town Hall, Muirtown, on Thursday, 4th September, to be addressed by the Right Hon. Lord Lamancha, M.P., His Majesty's Secretary of State for the Dominions. The Chair will be taken at 8 p.m. by His Grace the Duke of Angus, K.G. Among the speakers will be Col. Wavertree, M.P., the Hon. W. J. Murdoch, ex-Premier of Nova Caledonia, and Captain Sir Archibald Roycastle, Bart., D.S.O., prospective Conservative Candidate for Wester Ross.*" Oh, will he? Not by a long chalk! Catch me goin' to such a fiasco, with Charles hidin' here, and the show left to the tender mercies of two rotten bad speakers and a half-witted chairman.'

'Did you forget about it too?' Leithen asked.

'Course I did,' said Sir Archie wildly. 'How could I think of anything with you fellows turnin' my house into a den of thieves? I forgot it just as completely as Charles, only it doesn't matter about me, and it matters a devil of a lot about him. I don't stand an earthly chance of winnin' the seat, if first of all I mustn't canvass because of smallpox, and, second, my big meeting, on which all my fellows counted, is wrecked by Charles playin' the fool.'

Lamancha's dark face broke into a smile. 'Don't worry, old chap. I won't let you down. But it looks as if I must let down John Macnab, and just when I was getting keen about him. . . . Hang it, no! There must be a way. I'm not going to be beaten either by Claybody or this damned Tory rally. Ned, you slacker, what's your advice?'

'Have a try at the double event,' Leithen drawled. 'You'll probably make a mess of both, but it's a sporting proposition.'

Archie's face brightened. 'You don't realise how sportin' a proposition it is. The Claybodies will be there, and they'll be all over you—brother nobleman, you know, and you goin' to poach their stags next day! Hang it, why shouldn't you turn the affair into camouflage? "Out of my stony griefs Bethels I'll raise," says the hymn. . . . We'll have to think the thing out very carefully. Anyway, Charles, you've got to help me with my speech. I don't mind so much lyin' doggo here if I can put in a bit of good work on the 5th. . . . Now, Benjie, my lad, for your report.'

Benjie, not without a certain shyness, cleared his throat and began. He narrated how, following his instructions, he had secured Macpherson's permission to cut heather for besoms on the Raden haugh. He had duly taken up his post there, had remained till four o'clock, and had seen such and such people, and heard this and that talk. He recounted what he could remember of the speeches of Macpherson and the gillies.

'They've got accustomed to the sight of you, I suppose,' Palliser-Yeates said at length.

'Ay, they're accustomed right enough. Both

the young leddy and Macpherson was tellin' me to keep a look-out for poachers.' Benjie chuckled.

'Then to-morrow you begin to move up to the high ground by the Carnmore peat-road. Still keep busy at your besoms. You understand what I want you for, Benjie? If I kill a stag I have to get it off Glenraden land, and your old fish-cart won't be suspected.'

'Ay, I see that fine. But I've been thinkin' that there's maybe a better way.'

'Go ahead, and let's have it.'

Benjie began his speech nervously, but he soon warmed to it, and borrowed a cigar box and the fire-irons to explain his case. The interest of his hearers kindled, until all four men were hanging on his words. When he concluded, and had answered sundry questions, Sir Archie drew a deep breath and laughed excitedly.

'I suppose there's nothing in that that isn't quite cricket. . . . I thought I knew something about bluff, but this—this absolutely vanquishes the band. Benjie, I'm goin' to have you taught poker. You've the right kind of mind for it.'

(Continued on page 133)

THE TRAVELLING CINEMA IN CUBA.

DOWN on the East Coast of Cuba, a few miles from the sea, where the sun shines brazenly on the fields of sugar-cane, and mosquitoes approach the size of June Bugs, the travelling cinema show is a unique and picturesque institution. Even in the large cities it is comparatively rare to find the splendidly-equipped theatres with their symphony orchestras and latest offerings from Film Land that are common in Britain and America. In the rural districts, the natives are far too poor to afford any elaborate amusements, and except for an occasional 'Fiesta,' they have to supply their own brand of entertainment. Cuba is striving mightily to be modern in all things, and the portable cinema is one of her efforts to bring the outlying sugar districts into a little closer touch with civilisation.

The isolation of the people who work on these cane plantations is complete, for they are miles away from the nearest town. They live in communities that are nothing more than straggling lines of board-shacks, three or four saloons, and a company store. Stretching across the level country as far as the eye can see are the green acres of sugar-cane, merging toward the coast with tangled jungle and swamp lands.

If you should take a peep into one of the Cuban drinking places that forms the centre of attraction for the conglomerate population who gain their livelihood in the fields, you would see a sight that would make one of William S.

Hart's western film-settings seem tame in comparison. Crowded about the bar are Cuban planters and sugar men, each with an American-made six-shooter at his hip, who drink generously of Bocardi rum and while away the long evenings with animated discussions or occasional Spanish songs. On the fringe of the crowd are strapping Barbados negroes, there on contract as cane-cutters, with their sheathed cane-knives dangling about their legs.

Farther off in a corner a little group of Chinese coolies chatter away over their beer. They have been imported as cheap labour to tend the molasses pots in the nearby mill, and seem contented with their jobs.

Up from the loading-docks come a crowd of Cuban stevedores—small, wiry fellows of dark complexion, who drift up to the bar for their nightly round of drinks. A close inspection will reveal the handle of a knife sticking from under the broad leather belt each one wears. Weapons of all kinds are popular with the natives, and a fire-arm with the stamp 'Made in U.S.A.' is highly prized.

It is into such a community as this that the itinerant cinema manager makes his entrance. The merest rumour that a travelling show is in the vicinity is received with joyous exclamations and a call for more liquor. The man who makes the rounds of these obscure and unheard-of settlements is a resourceful and versatile fellow. He performs the duties of operator, advertising

man, ticket-taker, and manager with equal facility. With the help of a mulatto boy, he transports the heavy apparatus from place to place over the wide sugar-cane areas. Not possessing an advance agent to spread the glad tidings of his intended arrival, he formally announces the presence of his cinema show in the village by a long flowery speech from atop the bar of the principal drinking-place. The news travels fast, and soon the entire population, including the so-called police force, is crowded into the building, while the silver-tongued orator describes the merits of his films. The good people, whose imaginations are kindled by the glowing descriptions thus presented, are only too anxious for the performance to begin.

The first thing the travelling-cinema magnate seeks is a suitable building for the showing of his films. Rural Cuba does not afford the barn-storming facilities of America, and he must needs use the largest saloon in the village for his theatre. Usually this structure, although somewhat flimsy, is spacious enough for the purpose, and after much 'dickering' with the proprietor as to the rental, he proceeds to assemble the machine.

Sometimes it happens that the village does not boast of a place of sufficient proportions, but this does not 'feeze' the moving-cinema man. Selecting the broadest side of a shack, he tacks up his sheet and starts business under the stars. During the fall months the outdoor show is a rather risky undertaking, for tropical showers are frequent. No rain checks are given out, however, and when the downpour starts, the disappointed audience scurries to shelter, usually at the moment when the villain was just about to commit an especially dastardly deed.

The type of projecting machine used is reminiscent of the days of the 'Nickelodian,' when Indian thrillers were in vogue and the 'Just-a-minute-please' motto flashed on the screen as the reel was changed. Any parts of the apparatus that happen to be lost or stolen are replaced by the local blacksmith, and the result looks like a grotesque scissors-grinder rather than a motion-picture machine. Yet it always works under the experienced fingers of the manager-operator, and its assembly is the wonder and admiration of the mechanically inclined natives, who crowd around and bombard the nervous little man with questions. The absence of electricity worries him but little, for his light is supplied by a carbide gas generator which forms part of his travelling outfit.

No chances are taken about losing any of his prospective audience, and by means of a novel advertising scheme he endeavours to gather in those living outside the village. Beneath a bright light at the entrance to the improvised theatre is a poster of large dimensions, stating in glaring red letters the nature of the cinema to be shown. Below is a marvellous picture,

probably painted by some native futurist genius, representing the terrific fight of the film hero against half-a-dozen villainous-looking bandits. Most noticeable of all is the statement of the admission price, forty centavos. A good hour before the performance, the manager and his *aide* seat themselves beneath their startling advertisement, and proceed to issue their call to all and sundry with drum and bell. The former is more like the African tom-tom in appearance, and is played with the palms of the hands with the same rhythm as is employed by the voodoo worshippers of Hayti. Across the darkened fields of cane rolls the monotonous throbbing of the tom-tom and the sharp clanging of the bell. Sometimes this primitive orchestra is supplemented by a couple of native volunteers, one of whom shakes a pair of gourd rattles, while the other whines out a high-pitched Spanish ballad with the aid of a battered mandoline.

Such clamour is not long in rounding up every man, woman, and dog within a radius of two or three miles, and quickly changing from the rôle of musician to that of ticket-seller, our cinema magnate gathers in the silver. All is now set for the beginning of the show, and silencing the excited mob with some difficulty, he proceeds to deliver a short lecture on what is to come, emphasising the happy privilege of the audience in viewing such marvellous pictures. And truly they are marvellous! There are about six reels in all, three comedies and three dramas, not one being of a later date than 1913. The comedies are of the kind that came out when the moving-picture industry was in its infancy—French slapstick affairs, dealing with the amusing pranks of children. As for the dramas, they range from the Western thriller to the archaic 'costume drama.' In the latter, the old reliable story is presented of the beautiful maiden being rescued from the cruel clutches of the robber baron by her gallant mail-clad lover. This is the kind of picture that especially appeals to the emotional Cuban cinema 'fans.' They weep with the heroine when she is in trouble, and yell with delight when the naughty villain gets his inevitable share of punishment.

Western pictures of Indian massacres or cowboy hold-ups are something of a bore to the natives, because they themselves are prone to stage insurrections or young revolutions so often, that seeing such things in the movies isn't half as interesting as in real life. If, however, some innovation in the way of murder or banditry is shown on the screen, the chances are that some of the male members of the audience will try it out for themselves the next day—usually with disastrous results!

The last number on the programme, according to the manager, is the 'feature.' If we were to view it, we should probably be quite

disappointed, for it is nothing more than one of the episodes of those hair-raising serial thrillers that used to be the rage ten years ago. Yet the unsophisticated Cuban audience gasp with amazement at the daring deeds of the 'Americanos,' and sit on the edges of their chairs during the whole film. It is imperative that these good people possess good eyesight, for often it is hard to distinguish the characters from the streaks and specks on the screen.

When the last scene has flickered away, the

manager announces in a loud voice that the next instalment of the amazing serial will be shown on his next visit, which may be three or four months away, depending on the success of his trip. For many a day the pictures are the subject of animated conversation in the torrid cane-fields or on the loading-docks. The natives of eastern Cuba to-day are going through the same experiences that we did when the cinema was still a novelty, and they're enjoying it immensely.

MY WIFE AND I.

PART II.

VI.

I SOON found that my uncle and Sir Lewis were setting about arranging the desired match in a stolid, lumbering way that was in reality all too slow for me. I pretended to hang back, whilst all the time I went a great deal the faster. I was invited to dine at Long Edge; I refused. Sir Lewis met me, and talked graciously about his shooting; I thanked him, but said the Earlesharte coverts were good enough, and that my favourite sport was fishing. Uncle Richard suggested my returning the Cunninghams' hospitality, and I put up as many excuses as I might pheasants in October.

In the meanwhile, Kitty and I had encountered each other in the Long Edge woods, and I had filled her lap with hyacinths while she sat under a tree and tied them into bunches, looking like a little dryad in her summer gown. Later, we tossed hay together in Sir Lewis's farthest fields, the workers smiling at us.

At last I took her little hand, as we walked in the avenue one evening—I had ridden over to see Sir Lewis on some pretext or other—and told her that she must be mine, and that we would be playmates and partners for the rest of our lives. And she looked up at me with those brown eyes of hers, and said, 'Yes, Dick.' And I kissed her on the lips, and the brown eyes filled of a sudden with tears, that fell down betwixt trembling smiles, like April rain.

VII.

I announced my betrothal in a hang-dog manner to Uncle Richard. He took my grim way of conveying the news as the sign of a reluctance not yet wholly overcome, and ascribed the engagement entirely to his own powers of management and to my respect for his superior judgment. He made it plain that he anticipated some difficulty about bringing me to the actual point of the wedding, but that he had no doubt of achieving it, giving me time.

'There'll be a good many things to arrange, you know, Dick. There's plenty of time . . .

plenty of time. We shall have to see Mr Hutchinson, and all that.'

I hung my head to conceal the smile that I could not restrain, and laughed like a madman when I was out of hearing again, betwixt joy and triumph. For the game was not played out yet: far from it. 'This is *my* affair,' I told myself, 'and I mean to manage it my own way.'

Because Kitty was mine. And what right had any lawyer, or uncle, or cold baronet of them all, to come between us and carry out this binding of our hearts as though it were any common kind of business?

VIII.

Uncle Richard and I dined at Long Edge a day or two afterwards, in due course, and I bore the Cunninghams' congratulations, and his satisfaction, as well as I could. After dinner Kitty and I were allowed to slip away together, leaving our elders to talk about settlements in the drawing-room.

'Twas necessary to explain how matters stood to my little betrothed. As we wandered along the terrace in the moonlight I began. 'Darling, you know what they are talking about in there, don't you?'

Kitty dropped her pretty head, and did not answer.

'Well, now,' I continued, 'if we let them arrange it their own way, and have a big wedding, with all the county looking at us'—Kitty shuddered—'and lawyers, and coaches with four horses, and what not: if we let them do all this, Kitty, you won't be marrying *me*'—I paused dramatically—'you'll be marrying Uncle Richard.'

'I *shan't*, Dick!' cried my darling, standing still and lifting up her small face quite ablaze.

I had to reassure her. 'I don't mean, sweetheart,' I said, 'that Uncle Richard will put the ring on your blessed finger, and all that. But what I mean is——' And I went on to explain the situation to her. It took a considerable time, for Kitty was still rather frightened by what I had said.

When at length she did understand, she was ready to agree with me. 'You see,' I concluded, 'what I mean is, that we will just be married quietly, as we please, Kitty; and afterwards we will come and tell them that it is done. That will save a great deal of bother, and there will be no need for any one to be vexed, because they want us to marry; and we shall save them a vast deal of expense, besides.'

'Yes,' returned Kitty eagerly, 'that will be a good thing.' From which I gathered that Sir Lewis was inclined to economy, as, indeed, he had the reputation of being.

'But mamma will be buying all my clothes,' she hesitated, after a moment. 'My wedding-gown . . . she will be sure to buy a very fine one . . . you know, Dick——!'

'You will want all the other clothes, darling. And as for the wedding-gown, we will be married before she has ordered it.'

'O Dick!' cried Kitty.

'What! Don't you want to marry me, Kitty?' said I reproachfully; and Kitty begged my pardon, and promised to do all that I wished.

IX.

So we walked across the green together one morning, Kitty and I, when the dew was still bright on the grass, and the hot August sun had risen but a short way above the trees of Long Edge. I had taken the vicar into my counsel, almost upon command, the living being in the gift of Earlesharte. I brought the crackling license out of my pocket, and the little gold circlet that had been my mother's wedding-ring from my watch-fob, where I had placed it with I know not how proud a thrill. My man, Camp, and Kitty's old nurse were attending us as witnesses, somewhere in the chancel; but I scarcely saw them. The sunlight poured through the east window upon us twain as we stood up before the vicar, while he began to read. I heard the words in a dream, until he bade us join hands, and then each sentence fell on my ears like a hammer-stroke. Kitty's little hand lay in mine . . . my soul was in my fingers as I held it. . . . We spoke the vows, my voice sounding oddly hoarse and deep. . . . I slipped the ring over the slender member whose vein, they say, communicates direct with the heart—we were wed!

I led my bride home to Long Edge, and kissed her under the elms. 'Soon I shall come and bring you to Earlesharte, darling,' I said. 'But you will want some breakfast first, and nothing will be ready for you, love, till I have told Mrs Allison to prepare your rooms.'

I have it on her own confession that Kitty went straight to bed when she got in, to avoid seeing her parents, who were not yet come down to breakfast.

For myself, I rode back to Earlesharte in a fever of joy, and wonder, and triumph. My

revolution was fairly accomplished. It only remained to inform Uncle Richard of the expiration of his office. Now that I had made the plunge into independence I felt ready to dare any lengths, though my mind misgave me a trifle when I thought of Cotterell and the various problems that I had hitherto escaped. But I dismissed these drawbacks, and kept my courage high with thoughts of Kitty as I made my way to Uncle Richard in the library. I believe at that moment I even entertained visions of him as ending his days in his own apartments, like a superannuated minister. If I did, I was quite wrong, for he is 'practising' now, as one may say; only, he understands that his authority is limited to the estate, and that Kitty and I do not allow any one to manage the royal household but ourselves.

X.

I found him sitting in his big chair, looking as magisterial and overwhelming as ever. 'Uncle,' said I, copying his own manner as well as I could, and speaking with portentous solemnity, 'I'm worse than you thought me.'

'H'm, Dick?' responded my uncle, looking up, and preparing to treat me with a proper mixture of severity and indulgence.

'Far worse,' said I, sitting down, and slapping my riding-boots all up and down with my crop. I do not know precisely what I wished him to do or to say, except that I wanted him somehow to abjure my marriage.

'What is it now, Dick? . . . Debts again, eh? Debts?'

I shook my head. I suppose my silence and the shaking of my head gave an appearance of despondency. At any rate, Uncle Richard inclined to the side of clemency (to judge by his voice, for I dared not glance at him) as he proceeded. 'Come, Dick, what is it? You've been gaming—hum?'

I shook my head.

'Well, what *have* you done?' asked my uncle, rather impatiently.

'I'm married,' said I.

He fairly leaped from his chair. I had not thought him so nimble. 'What, sir?'

'I'm married, sir.'

He stared at me for a few seconds as though he did not credit his senses. 'But you're engaged to Miss Cunningham, sir!'

'No,' said I, 'I'm not.'

'But I say that you *are*, sir!' roared Uncle Richard.

'I can show you my marriage lines,' I returned. 'Twas wonderful how cool I kept. I marvelled at it myself.'

Uncle Richard began to walk up and down the room. If I had looked at him, which I could not, I believe I should have seen that he was really upset to an extent that might have moved me to contrition. At that moment his

world must have been whirling about him; it had hitherto gone round so orderly, and at such a regular and regulated pace, that he was perfectly nonplussed. 'You're *not* engaged to Miss Cunningham?' repeated he, stopping.

'No,' said I. For, of course, we were married, and there was no longer such a person as 'Miss Cunningham.' The occasion when he had first broken the news of his negotiations with Sir Lewis, and my feelings then, recurred forcibly to my memory. My wrongs spurred me on. What might he not have led me into? 'I would have been all the same. 'Look here, sir,' I said, 'you will remember that 'twas you who started that business; I never began it. You dragged me into it, willy-nilly. You said things to Sir Lewis Cunningham that fairly compromised me . . . for, of course, any ordinary person would suppose that I was acting for myself, at my age—'

I saw a slight expression of surprise cross his face in the midst of his anger, as though the idea were actually new to him. He interrupted, in a tone that I confess did shame me somewhat. 'If I had known what a young blackleg you were, Dick, nothing would have induced me to involve that innocent young lady, and her respectable parents, in such an alliance.'

I answered sulkily—because I was beginning to repent my usage of him just a trifle—'You see what you've done, however, sir.'

Then, of a sudden, it came upon me that 'twas his own scheme I had completed—that it was he himself who had led me into the offence. I had only, as it were, taken the bit between my teeth and galloped ahead. And a great burst of laughter rose up and threatened to choke me, so that I was obliged to plunge out of the room and give it vent in the garden.

XI.

I went to Mrs Allison, and told her to prepare my wife's rooms immediately.

She said, 'Yes, sir,' complacently.

'By dinner-time,' I added.

Mrs Allison dropped a whole pile of clean clothes that she had in her arms. 'Mr Richard?'

'By dinner-time,' said I firmly.

'The great walnut chamber, and the red boudoir, and the dressing-closet that opens out of it?' said Mrs Allison in a gasping way.

'The walnut chamber, and the red boudoir?' I returned, considering. 'No, my wife shall not have those. She is to have that nice sunny room on the south—'

'Oh, Mr Richard! Only the nursery that was.'

'—And that pretty chamber over the west porch will do much better for her boudoir. It does not smell of stuff curtains, at any rate, and she can see the garden from it.'

I left Mrs Allison wailing about 'a Lady of

Earlesharte,' and 'who had ever heard of such a thing?' But she was too much taken by surprise to resist in proper force, and I gave her no time to recover herself. I daresay she had barely got her breath, and left off putting her hand to the side-seam of her bodice, ere I was riding down the avenue.

XII.

I burst in on Sir Lewis and Lady Cunningham at breakfast. 'I want Kitty,' I said.

They looked astonished. Sir Lewis rose slowly, and leaned towards me, like a courteous vulture hovering over its prey. Lady Cunningham sat stiffly erect, with cold eyes.

'Certainly, Richard,' returned my unconscious father-in-law, after a slight pause, 'you have a right to ask for our daughter. My dear, be so good as to ring. Kitty is late in coming down this morning.'

'She will be down directly,' returned Lady Cunningham, still fixing a frigid gaze on me. I daresay I appeared rather wild.

A few minutes passed, while I fidgeted up and down the room, refusing the chair that Sir Lewis offered me at intervals. At heart, I was afraid of them both, yet I was master of the situation, and I was determined to carry it.

'My dear, will you ring?' said the baronet again, after enduring my restlessness with the watchful but rather helpless calm of a keeper in charge of an insubordinate animal.

This time Lady Cunningham complied. They exchanged glances, plainly signalling 'Excited!' Her attitude announced as plainly, 'Anything to get rid of him.'

A footman appeared. 'Call Miss Kitty's woman,' said my lady.

In a few moments Kitty's old nurse was curtseying in the doorway. Her eye sought mine fearfully, then dropped under her mistress's.

'Miss Katherine is late in rising, Beaton?'

'Yes, my lady. Miss Katherine—Miss Katherine is indisposed, my lady.'

'Ill?' cried I, hastily. 'Why, she was all right this m—' Beaton's terrified glance, full of meaning, shot at me once more; and I understood the nature of Kitty's indisposition as being moral, and not physical.

Lady Cunningham turned to me triumphantly. 'I am afraid you cannot see Kitty to-day, Richard. Perhaps if you come to-morrow at a later hour—your call was made rather early—'

'I have come to take Kitty to Earlesharte,' I said distinctly. 'She is not ill. We were married this morning.'

I do not remember if anything happened immediately after I said that. I have a vague impression of the Cunninghams' faces like stone-carved ones, and of Beaton's terror-stricken visage sinking back in flight from the doorway.

XIII.

Suddenly I burst into a great roar of laughter. I could not help it; the position was so comical.

Then Sir Lewis found his voice. 'This is a joke,' he said.

I became grave with an effort. 'Look here,' I responded. I pulled out my marriage certificate, and handed it to him. He read it and passed it silently to Lady Cunningham, then back to me.

I continued, standing in the middle of the floor, 'I have come to fetch my wife. You have no right to stop me. You consented to our engagement, and now we are married. We have done it our own way, instead of yours, that is all.'

Lady Cunningham spoke at last. 'Villain!' she uttered. Doubtless she was thinking of the wedding-gown, the coaches, the cakes, the display. Well, poor woman, we had wronged her in that respect, but 'twas a wrong that might be oftener borne.

Then, to end the scene, Kitty ran into the room in her cloak and hood. Evidently Beaton had fled upstairs and told her what was happening. She came straight to me, and together we stood facing the angry parents, her little hand with the ring upon it clasped in mine.

'Come, darling,' I said, making a movement to go.

'Stop, stop!' cried Lady Cunningham, forgetting her pride in anxiety as to further developments of our madness. 'How are you going?'

Without remorse, I answered by appealing to my bride. 'Kitty, you can ride on a pillion behind me, can't you?'

'Yes, Dick,' assented Kitty.

'A pillion! . . . O Richard — Kitty —!' wailed Lady Cunningham, 'at least have the coach! Do not be seen going through the lanes —'

'The clothes can come in the coach,' I said firmly. 'Kitty and I are man and wife, and we do not care if all the world sees us. I've as much right to carry my wife home behind me as any farmer. Goodbye, Sir Lewis. Goodbye, madam. Kitty is still your daughter, though she is married to me.—Say goodbye to your parents, darling; we must go now.'

The Cunninghams remained stiff under Kitty's penitent embrace, and we went away together.

My bride began to cry as we left the house. 'O Dick, I fear we have done very wrong!'

'Not in the least, darling,' I maintained. 'Tis all a matter of fuss and fripperies. They'll soon forgive us.'

XIV.

As we rode towards Earlesharte, I said, 'Now see, love, you're not to do what Uncle Richard wants. Remember that.' 'Twas a trifle brutal of me; but as it fell out, it did not signify.

I was surprised, as we rode up the avenue, to see Uncle Richard standing on the doorstep. Surprised, and rather abashed at his magnanimity; for of course he did not know whom I was bringing to be the mistress of Earlesharte Hall. It was a sacrifice to his sense of fitness, a concession of his own dignity to that of the family, which softened me and made me feel that his old domination had been based on something better than I had understood. For all he knew, I was about to introduce to him a milkmaid, an innkeeper's daughter—what not! He could not suppose her to be anything better, from my manner of presenting her. Yet there he stood upon the steps.

I saw him give a start as we approached . . . his stately attitude changed perceptibly. He peered forward, as though scarcely believing his eyes. As Kitty's identity became unmistakable a whole pantomime of expressions passed over his form. He tucked his chin in—he threw it up. He took a pace along the terrace and back again, in an agitated way. He patted his waistcoat, and then clenched his fist upon it. He shook his head violently—paused—shook it again. He was still shaking it, but not as though he were angry, to judge by his face, when we reached the foot of the steps.

'Dick, Dick—Dick! Dick!' said he then, just like a clock. Before I could lift my bride down, he had gone forward and taken her two hands.

'And I suppose, my dear,' he said in a voice that was not as firm as usual, 'you can't forgive an old man for trying to make you happy—you and Dick?'

And my bride, with a defiant look at me, threw her arms about his neck, and said, 'But we thank you.'

THE END.

THE SALT BEACHES.

I REMEMBER the wild, salt beaches
Where the limpet-gatherers roam;
Well do I know that sand which reaches
Cold and wet to a line of foam.

Well do I know that rain-dark moorland
(Lowering clouds roll up from the west)
Where the sheep loom large in the heather,
And each little bird sits close on its nest.

Long dark nights in a lonely cavern—
Inky pools by the cliffs o'erhung—
But when I heard the bull-frogs' chorus
I knew where I lived when the world was young.

I was a prince in rich Mycenæ,
Merchants all paid toll to me;
Latticed rooms in the ancient stronghold
Looked on the mountains and the sea.

All are gone, but the memory lingers
Bitter-sweet of the rain and sun;
And I shall seek these pleasant places
When my wanderings are done.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

THE Sultan Abd el Aziz caused a pleasant message to be conveyed to me, that, if the time suited, he would be glad to play golf with me on a certain day at three o'clock in the afternoon. I was then in Tangier, and the Sultan dwells in a palace on what is called 'the Mountain,' some way outside the city. On the plain below, not distant, is a golfcourse of a kind that is the best to be produced in these difficult climatic parts, and it is called the 'Diplomatic' course, because it is the chief playground of the ministers of the various Powers, their friends, and such people as it is proper should be gathered with them in the same social and sporting community. Here occasionally the Sultan Abd el Aziz plays the game. There are few players on this course, and an adequate privacy is assured, but, because he greatly likes the game and desires complete possession of a course, the Sultan, when we met, pointed out to me on the hillside in the distance the lines along which would run the new course of his own which he was having made at that very time, where the starting point would be and where the small pavilion. It was evident that the Sultan, assisted by his golfing adviser, who happens to be an Irish gentleman with an intimate knowledge of the game and all its ramifications in these our islands, was about to be master of the best course to be found at this time in all Morocco. Yet that may be saying little, since the only other course at present in existence is this Diplomatic ground, whereon our international and inter-racial game was duly played and much enjoyed for the real pleasure of the golf. However, the hand and mind of this player are working upon some new schemes for golf in southern Morocco, for there are French interests in the regions of Marrakesh and Fedala that conceive it were well if the most universal game of both social and economical importance, as it is thought to be, were planted there. Only by count of a single item of humanity, I think, does the Sultan Abd el Aziz lose the distinction of being the only Moor at the present time who devotes attention to this curiously fascinating pastime, which apparently attracts all races, creeds, and ranks, and this other is an ex-minister of an old régime who, I am led to

believe, having been a strong man in the days of power, retains some independence of method still, and has a tendency to make laws of his own as the play proceeds, according to the necessities of his case. Thus, and for all reasons, when it comes to a case of golf in Morocco, the Sultan is the man, and worthily.

* * *

Let it be declared that there is no nonsense in this affair, and that we are writing of golf and golfers. Thoroughly does the Sultan know the game, and he is as devoted to it as any of us. Possessing a natural instinct for our British games (strange, but true, and perhaps the only Moor of which such a thing could ever be said), he was led some years ago to make an attempt at golf, and was instructed by French professionals of St Jean de Luz. They taught him the elements of the game, how to stand, and where to put his feet, and how to swing his club, imparting to his style something more of what we may still call an East-coast swing than might have been imagined possible in the circumstances. The chief golfer of St Jean de Luz, Arnaud Massy, acquired his own playing parts and style at a golfing shrine of no less fame and respect than North Berwick. Without hesitation and seriously, as one who in his time has been accustomed to make himself a judge of golfers, I state that the Sultan Abd el Aziz has an excellent style. To continue with the impartial truth, it must now be told that he wallows in the vice with which the greater part of the world of golf has been afflicted more and more since the rubber-cored ball came to be invented, in that he loves to drive the ball very far, has a lust for long driving for its own sake, for the sensuous pleasure of this rhythmical and passionate exercise. And such vice has been nurtured not among other golfers likewise sinning on the links of our own golf-laden land, but in the solitudes of Morocco, proving again that it is inherent in golfers now, conditions and circumstances being what they are, and is not a habit engendered by simple imitation. Indeed, some might argue from the evidence that in comparative solitude all restraining influences are abandoned or discounted, and that the vice—if vice it be, for the moral standards of golf are changing now—may flourish more than

when there are reproachful eyes or, as is more important, holes and matches to be won, for the Sultan is one of the uttermost slaves to long driving that mine eyes have seen. Give to him a full fling from the tee, all in balance and harmony, not a creak or a twitch in the human machine, only a sense of the joy of power silkened and elasticated, the ball sent sweetly from the middle of the club, and he cares not what ensues, truly he does not care. This must be held for a defect in him as a golfer. He will play away tolerably well with irons afterwards, but for putting he has no liking. I have witnessed his taking four putts on a green with a carelessness suggesting he would little mind if it were forty, and he has ceased putting when tired of it, even though the fate of the hole were still undetermined. Something in this is to be excused him, since from the tee the stroke and the ball and its flight are matters of atmosphere, and may be closely governed by some exact if undetermined science. The person who fails in this effort must be held to blame; but on the Moroccan putting-greens there are inevitably grits and hindrances, and when last I played on them in the departed summer there were locusts, too, so that no man here could be master of his game or full gainer by his exerted skill. Yet to show how much the instinct of golfers everywhere is the same, and how this Sultan Abd el Aziz embraces precisely like passions with all British golfers, and can indeed express them in phrases which, translated, are worthy of being established among the permanent and accepted aphorisms of golf, I will repeat an exclamation he made to me. He had made a remarkably good tee-shot, and the ball in its course had assumed the most promising and delightful trajectory. The Sultan has that best of qualities of being a silent golfer, and he did not speak, but showed his pleasure by the light in his eyes and a few twitches of facial expression. Hereupon I ventured comment, and as we strode on after the balls we had driven, I murmured to my opponent, having hinted at the subject once or twice before, that truly he had a passion for long driving, and that—but there he interrupted me, and in tones of ecstasy scarce subdued declared, ‘I don’t know why I like it, but I do!’ Could the strange and potent fascination of this rhythmical exercise have been better suggested by any golfer in the world? I do not think so. This should become a classical phrase. I also do not know why I like it, but truly I do, and in generations to come golfers here at home may drive and say that, as in the celebrated case of the Sultan Abd el Aziz, they do not know why they like it, but they do. No other formula will serve them so effectively for the expression of their sentiments.

* * *

This, my opponent in a very pleasant game, the Sultan Abd el Aziz, is a man of whom

you may hear again in a very different capacity at some future time. He has already made great history; he has a further chance. At this moment the world awakes to the simple truth that Morocco in the piece is not just a half-mysterious land flowing with milk and honey, which is being collected in the casks of the enterprising French, with nothing more to be said or done, as is the vague impression that somehow spreads. Despite the magnificent effort of our friends, and the amazingly effective manner in which they have changed the face of a large part of the land, this Morocco is still largely an intensely backward and almost a savage country. Very eastern in feeling, it is charged with elements of difficulty and resistance to European influence, while it comes within the sympathetic bond of the Moslem ideal. European international jealousies and rivalries make the situation difficult for all, and more difficult will it be in time to come, while the interests of our own country, which have not been well pressed in recent times through deference to France, must become more and more emphasised and increasingly delicate in the maintenance. The case of Abd el Krim and Spanish Morocco opens up new problems; and it must be remembered that while ‘zones’ mark great divisions and indicate separate countries for the occupying Europeans, they mean nothing to the natives, for whom there is only one Morocco, one Maghreb, the land of the setting sun, as the name indicates. All who spend any length of time in Fez, the chief capital, as I did recently, must be deeply impressed with the general disdain of the native people there, high and low, for all Europeans, including the French who exercise their protectorate there. One need not be a pessimist to feel that this is one of the danger-spots of the world. Besides, it is not as a rule sufficiently realised that fighting proceeds in the French zone continuously, and that in the south the natives on the slopes of the Atlas mountains, always hostile at heart, are kept in hand only by the pressure and the influence of their own great chiefs, heavily subsidised by European money. Tranquillity in Morocco, then, is a larger question than has been indicated in the various news of the difficulties of the Spaniards in the northern portion of the country, and, as part of the Mediterranean system, it is of the most vital importance to ourselves. In this Morocco there are various great and powerful figures of whom our people, in the main, seem to know but little. Perhaps they are secreted through subsidies, or they move stealthily in a shadowy background. At home the general knowledge of the native personalities of Morocco was until recently limited to Raisuli, the crafty old brigand turned conqueror and statesman-conspirator; and it came like surprise at the beginning of the winter that there was another, Abd el Krim,

who was clever and successful likewise. Yet these leaders of the hill-tribes of the north are small people compared with others of power whose names are unknown here. There is the great Glaoui of the south, who is one of three chiefs who control and hold in check the warlike tribes that creep about the Atlas mountains, and could, let loose, make European occupation of the lower parts impossible in existing circumstances. His home is a castle in the wild fastnesses of the Atlas, of such a stark, half-barbaric grandeur as, in the contemplation, to set beating in the senses that raw mad music of *Peer Gynt* when the Hall of the Mountain Kings is presented. The chief of the Glaoui has been made, with the most substantial tokens, a friend of France, and his relatives are given remunerative offices under the protectorate. Years ago, but within our time, there was a sultan on the throne of Morocco whose sovereignty was coveted by his brother, who engineered rebellion in the south, and had the Glaoui to assist him; so that victory was to this side, and Mulay Hafid won and became sultan in place of Abd el Aziz—the prince with whom I had been playing golf. That was a tremendous time, and it marked the great change in Morocco. Mulay Hafid caused a *rogz*, or pretender, Bu Hamara, who was making trouble in the country and gaining many adherents, to be carried about and exhibited in an iron cage, not large enough for him to stand erect in, and after weeks of confinement in this receptacle (now exhibited in a museum in Fez—being something like a double-sized parrot's cage with a hole in the wooden bottom), flung him to wild beasts that tore him to pieces. However, Mulay Hafid, evidently a most unpleasant fellow, in due course found himself in difficulties, and the French, being now established in their protectorate, preferred that another brother, Mulay Yusuf, willing to do all that he was told and make no trouble of any kind, should be sultan; so Mulay Hafid had to leave the country, and during the Great War was a considerable nuisance through his assistance of the Germans in their schemes to disturb France in North Africa. For the most part this exiled sultan, after his stormy career, went promenading about and amusing himself in various parts of France and Spain. A large body of attendants was attached to him, and his escapades in various places attracted attention from time to time. His harem was left behind, and living relics of it are still stored in the old palace of Meknes. Mulay Hafid, however, does not seem to count with the native people of Morocco now; he never really did. And assuredly the existing sultan, Mulay Yusuf, does not, for the people make no secret of their contempt of him for his subservience to the invader. None of the three sons—by different wives—of the old sultan, Mulay Hassan, who died in 1894, has his father's great qualities

of ruling strength and determination; perhaps in the new conditions it would make no difference if they had. Mulay Hassan was the last of the great sultans of the old type, and when Morocco, always by the nature of things inclined to lapse to full anarchy, was crumbling, he used to lead expeditions all over the country, by force or by cajolery imposed his authority, and held it in a piece. On such grand excursions he took with him his young and favourite son, Abd el Aziz, who rode on a white horse beside him. Together, with an extensive army accompanying, they made journeys through the plains and over the mountains, the Sultan here and there cajoling, promising, threatening, but pacifying and strengthening always. Strong men might shrink from such arduous expeditions now; and really this one killed the Sultan. They rode over the great Atlas mountains. Mulay Hassan had the ambition to visit distant Tafilet, the source of his family, where the cherifs were of great importance and prestige, and by the Atlas crossing at Kasb-el-Maghzen, he went there and was well received. The cherifs liked the little Abd el Aziz, and that visit had much to do with the circumstance that they favoured his succession to the throne. In due course Mulay Hassan, having lived the strenuous life and patched his empire up, died, and so veritably ended, though it was not then understood, the days of the old and independent Morocco. Reasons of custom and state made it necessary to hold his death secret for a time while his body was carried through the country, only a few being aware that the vital spark had left it. This made it easier for Abd el Aziz to rise to the throne. The proclamation of the new sultan was made at Rabat at the same time as the demise of Mulay Hassan was announced, and the tribes had no opportunity for dissent.

* * *

Somehow the young Sultan Abd el Aziz was not like any of the other sultans of Morocco one had ever heard of. That was largely the cause of the difficulties that led to the rebellion against him and his undoing, while his much less admirable and enlightened brother, Mulay Hafid, came to reign in his stead. In the same way the essential differences between the Sultan Abd el Aziz and other sultans and princes might very conceivably—and more than that—lead to some remarkable recovery on his part. In the mosques of Morocco the faithful pray for the sultan they recognise; and we hear, in such a manner that we know, that the name of Abd el Aziz is mentioned in these days. Mulay Hassan, the father, a strong man, and one of keen discernment, liked this son the best, and believed in him most for sovereignty, and that keen Moor saw that times were changing, and men, even in Morocco, must to some extent change with them. Abd el Aziz differs in appearance from the regular type of eminent Moor of good or

high family, for the type is well marked. He does not possess the same roundness of face and heavy softness of feature, nor eyes of the same degree of somnolence; nor is he even now at middle age corpulent, as is the way with the Moor on whom the years begin to creep. His features are finer—more of the Indian type—his eyes are restless, flashing, and his body is lithe, while his manner indicates that his mind and imagination are catching quickly at the changing scene and incident of existence, and not dreamily turning inwards from them. When first I met him the instant impression was that this prince differed greatly from other men of high Moorish rank. As sultan, this Abd el Aziz did not conduct himself as others had done. He did not accomplish extensive massacres, which is a well-credited method of exhibiting strength. He displayed a curiosity most unusual among Moors concerning the signs and things of progress in the European world. He wanted them himself. He would ride a bicycle, he was interested in photography, and he devoted himself to many innocent pleasures to which the Moorish court was not accustomed. Perhaps he did some unwise things. At the same time his country's finances became weakened, and foreign traders were taking advantage of the Sultan's predilections. Yet his intelligence and enlightenment were conspicuous, and in a settled and more advanced Morocco the possibilities of this sultan might have been enormous. As it was, discontent arose. The Glaoui, who went to Fez with the object of assisting the Sultan against the pretender, Bu Hamara, felt he was not treated with sufficient respect, and returned to his southern headquarters indignant. At Marrakesh, the southern capital, Mulay Hafid, the Sultan's brother, a violent and cruel man, was writhing under an irritating sense of his fraternal inferiority, his comparative penury, and, so far as he could and dared, he was intriguing among the tribes of those parts. When the Glaoui came back, he and Mulay Hafid began to associate more and more closely, a plot was started, and then one day, after a massacre of Europeans at Casablanca that was likely to make difficulties for Morocco, the Glaoui called a general assembly of religious heads and the chiefs of tribes, declaring to them that Abd el Aziz was delivering the country to the Nazarenes, and only Mulay Hafid could save it. The religious heads demurred, but when the Glaoui made a gesture to the chiefs of tribes they turned towards Mulay Hafid, and with one voice acclaimed him sultan. Thereafter the army of Abd el Aziz and that of Mulay Hafid set out towards each other, though it is said facetiously that each did its best to avoid its enemy. One morning an attack was being made by the forces of Abd el Aziz against a section of his rivals, when a body of horsemen that had been sent

forward charging did not return, and it was learned that they had deserted to the enemy. His whole army melted, and he was left with only his French army instructors and a number of black slaves. 'We are betrayed!' he said simply, and he knew his sultanate was ended, and that his life was in the gravest peril. His cloak was already shot through in several places. The slaves closed round him and made a body-guard; they hurried him to a place a couple of hundred yards away where horses waited; and, mounting him, they galloped into the lonely solitudes of the country. Night fell, and they halted. The Sultan sat under a fig-tree, and discoursed upon the strange chances of fate to one of the French officers who held to him. 'This morning,' he murmured, 'I was sultan, and I nominated the kaids. To-night I am just a man like all the rest. It is the will of Allah!' Eventually he retired to the palace he built for himself near Tangier. Such are a few fragments of the history of my opponent on the golfcourse. Propaganda has some delicate and devious ways, and strenuous efforts have been made to discredit Abd el Aziz, especially by the use of belittling nicknames, but they have failed. Of all the princes of Morocco, he is known as the most enlightened.

* * *

At the appointed time the Sultan drove up to the Diplomatic course in his car, and as he descended the native boys went forward to kiss his hand. He wore gray flannel trousers and a pleated golf-jacket, with a fine gray jilaba over all, discarded when the play began. On his head was a white turban; he was shod with ordinary golfing-shoes. For the game he assumed spectacles of tinted glass, and gloves with rubber fingers; and the experts may like to know that he carried six good clubs, kept very clean and nice—three of wood, being a driver, a brassy, and a spoon, with one iron, a mashie, and an aluminium putter. He was a pleasant companion, and it was a beautiful day, with storks floating slowly here and there over the course, and a white marabout or holy place shining out conspicuously on the hillside where his own new course was about to be made. Before beginning, he told me that he was fond of our British games, and had been much addicted to tennis, but for him now there was nothing like golf. 'They tell me,' I said, 'that Your Majesty drives a long ball.' He hesitated a moment, and answered cautiously in the manner of one holding up a reservation, 'Sometimes.' For no golfer ever knows what is about to happen. His style, as I noted it at the first teeing ground, was good. He occupied a square stance, used the overlapping grip, indulged in one waggle of the club of a somewhat flourishing kind, then, rather curiously, a final address about nine inches behind the ball, and a swing which was rather quick. Some-

times he tops and sometimes pulls, but his good ball is very good indeed—fast and low and a willing traveller. On this hard turf his best drives were well beyond two hundred and fifty yards, perhaps over three hundred. And I liked his close regard for the etiquette of the game. He made no ejaculations when a shot went wrong, and talked little during the game. But once we spoke of the possible origin of golf, and he agreed that something like it must have been one of the first things ever done, and he thought it would be popular in Morocco some time, and good for the country. We spoke of Arabic terms, and I took a lesson from him, learning that *hofra* is the proper word for a hole in the ground, like a golf-hole, but that there is another word for such a thing as a button-hole. We played some shots well. At a short hole over a gully both were putting for twos, and at the long eighth, maybe the best hole of the course, the Sultan's ball was delivered close to a stream in front of the green, some four hundred and sixty yards from the tee, with a drive and an iron shot. Here the scene was sweet. Barbary sheep were dallying on the banks of the stream, near by eucalyptus trees were overhanging it, and from the middle distance we could hear the characteristic chirping of a party of native girls in their white

attire as they were busy washing clothes in the running water. It was a pleasant game. The Sultan condoled with me for that, having come to Morocco for other business, I had no clubs of my own with me, and had had to borrow some. He wished to play with me again, and exacted a promise that I would bring my own next time. For a few minutes he fell to something like that mellow mood of satisfaction that golfers often feel near the end of an excellent day. It is against law and custom to photograph a Moor, especially a sultan in his mightiness, but, knowing I had a camera in my possession, he volunteered to pose. 'But Your Majesty is too yielding,' I said; 'you know you do not like it.' 'But as between friends!' he smiled. And later he confided to me that one of his life's desires was to play at St Andrews, Deal, and Sandwich, and that he meant to do so. He drove me back to my quarters in his car. At the moment of starting, something possessed a Moorish child, just a baby, that somehow came suddenly into the scene, to toddle up to the car crying and screaming in the manner peculiar to babies the world over. The Sultan Abd el Aziz took it into his car and petted it, and, having ascertained that its place of residence was some way along the road, transported it there.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER V.—THE ASSAULT ON GLENRADEN.

SHORTLY after midnight on the morning of the 29th day of August, three men gathered at the door of Macpherson's cottage, and after a few words took each a different road into the dark wastes of wood and heather. Macpherson contented himself with a patrol of the low ground in the glen, for his legs were not as nimble as they once were, and his back had a rheumatically stiffness. Alan departed with great strides for the Carnbeg tops, and James Macrae, the youngest and the leanest, set out for Carnmore with the speed of an Indian hunter. . . . Darkness gave place to the translucence of early dawn, the badger trotted home from his wanderings, the hill fox barked in the cairns to summon his household, sleepy pipits awoke, the peregrine who lived above the Gray Beallach drifted down into the glens to look for breakfast, hinds and calves moved up from the hazel shaws to the high fresh pastures, the tiny rustling noises of night disappeared in that hush which precedes the awakening of life, and then came a flood of morning-gold from the back of the dim eastern mountains, and in an instant the earth had wheeled into a new day. A thin spire of smoke rose from Mrs Macpherson's chimney, and presently the three wardens of the marches arrived for breakfast. They reported

that the forest was still unviolated, that no alien foot had as yet entered its sacred confines. Herd-boys, the offspring of Alan Macdonald and James Macrae, had taken up their post at key-points, so that if a human being was seen on the glacis of the fort the fact would at once be reported to the garrison.

'I'm thinkin' he'll no' come to-day,' said Macpherson after his third cup of tea. 'It will be the morn. The day he will be tryin' to confuse our minds, and that will no' be a difficult job wi' you, Alan my son.'

'He'll come in the da-ark,' said Alan crossly.

'And how would he be gettin' a beast in the dark? The laird was sayin' that this man John Macnab was a gra-and sportsman. He will not be shootin' at any little staggie, but takin' a sizeable beast, and it's not a howlet could be tellin' a calf from a stag in these da-ark nights. Na, he will not shoot in the night, but he might be travellin' in the night and gettin' his shot in the early mornin'.'

'What for,' Alan asked, 'should he not be havin' his shot in the gloamin' and gettin' the beast off the ground in the da-ark?'

'Because we will be watchin' all hours of the day. Ye heard what the laird said, Alan Macdonald, and you, James Macrae. This John

Macnab is not to shoot a Glenraden beast at all, at all, but if he shoots one he is not to move it one foot. If it comes to fightin', you are young lads, and must break the head of him. But the laird said, for God's sake you was to have no guns, but to fight like honest folk with your fists, and maybe a wee bit stick. The laird was sayin' the law was on our side, except for shootin'. . . . Now, James Macrae, you will take the outer marches the day, and keep an eye on the peat-roads from Inverlarrig, and you, Alan, will watch Carnbeg, and I will be takin' the woods myself. The laird was sayin' that it would be Carnmore the man Macnab would be tryin', most likely at skreigh o' day the morn, and he would be hidin' the beast, if he got one, in some hag, and waitin' till the da-ark to shift him. So the morn we will all be on Carnmore, and I can tell you the laird has the ground planned out so that a snipe would not be movin' without us seein' him.'

The early morning broadened into day, and the glen slept in the windless heat of late August. Janet Raden, sauntering down from the Castle towards the river about eleven o'clock, thought that she had never seen the place so sabbatically peaceful. To her unquiet soul the calm seemed unnatural, like a thick cloak covering some feverish activity. All the household had been abroad since breakfast—her father on a preliminary reconnaissance of Carnmore, Agatha and Mr Junius Bandicott on a circuit of Carnbeg, while the gillies and their youthful allies sat perched with telescopes on eyries surveying every approach to the forest. The plans seemed perfect, but the dread of John Macnab, that dark conspirator, would not be exorcised. It was she who had devised the campaign, based on her reading of the enemy's mind; but had she fathomed it? she asked herself; might he not even now be preparing some masterstroke which would crumble their crude defences! Disquieting stories which she had read of impersonation and the shifts of desperate characters recurred to her mind. Was John Macnab perhaps old Mr Bandicott disguised as an archæologist? Or was he one of the Strathlarrig workmen?

She walked over the moor to the Piper's Ring, and was greeted by a mild detonation and a shower of earth. Old Mr Bandicott, very warm and stripped to his shirt, was furiously busy and most voluble about his task. There was no impersonation here, nor in the two fiery-faced labourers who were burrowing their way towards the resting-place of Harald Blacktooth. Nevertheless her suspicion was not allayed; she felt herself in the ante-chamber of plotters, and looked any moment to see on the fringes of the wood or on the white ribbon of road a mysterious furtive figure which she would know for a minion of the enemy.

But the minion did not appear. As Janet stood on the rise before the bridge of Raden, with her hat removed to let the faint south-west wind cool her forehead, she looked upon a scene of utter loneliness and peace. The party at the Piper's Ring were hidden, and in all the green amphitheatre nothing stirred but the stream. Even Fish Benjie and his horse had been stricken into carven immobility. He had moved away from the road a few hundred yards into the moor, not far from the waterside, and his little figure, as he whittled at his brooms, appeared from where Janet stood to be as motionless as a boulder, while the old gray pony mused upon three legs as rapt and lifeless as an Elgin marble. The two seemed to have become one with nature, and to be as much part of the sleeping landscape as the clump of birches whose leaves did not even shimmer in that bright silent noontide.

The quiet did something to soothe Janet's restlessness, but after luncheon, which she partook of in solitary state, she found it returning. A kind of *folie de doute* assailed her, not unknown to generals in the bad hours which intervene between the inception and execution of a plan. She had a strong desire to ride up to Crask and have a talk with Sir Archie, and was only restrained by the memory of that young man's last letter, and the hint it contained of grave bodily maladies. She did not know whether to believe in these maladies or not, but clearly she could not thrust her company upon one who had shown a marked distaste for it. . . . Yet she had her pony saddled, and rode slowly in the direction of Strathlarrig, half hoping to see a limping figure on the highway. But not a soul was in sight on the long blinding stretch or at the bridge where the Crask road started up the hill. Janet turned homeward with a feeling that the world had suddenly become dispeopled. She did not look back, and so failed to notice first one figure and then another, which darted across the high-road and disappeared in the thick coverts of the Crask hillside.

At the Castle she found Agatha and Junius Bandicott having tea, and presently her father arrived in a state of heat and exhaustion. Stayed with a whisky and soda, Colonel Raden became communicative. He had been over the high tops of Carnmore, had visited the Carn Moss and Corrie Gall, had penetrated the Gray Beallach, had heard the tales of the gillies and of the herd-boys in their eyries, and his report was 'all clear.' The deer were undisturbed, according to James Macrae, since the morning. Moreover, the peat-road from Inverlarrig had relapsed, owing to recent rains, into primeval bog, which no wheeled vehicle and few ponies could traverse. The main fortress seemed not only unassailed but unassailable, and Colonel Raden viewed the morrow with equanimity.

The Carnbeg party had a different story to tell, or rather the main members of it had no story at all. Agatha and Junius Bandicott appeared to have sauntered easily into the pleasant wilderness of juniper and heather which lay between the mossy summits, to have lunched at leisure by the famous Cailleach's Well, and to have sauntered home again. They reported that it had been divine weather, for a hill breeze had tempered the heat, and that they had observed the Claybodys' yacht far out at the entrance to Loch Larrig. Also Junius had seen his first blue hare, which he called a 'jack rabbit.' But of anything suspicious there had been neither sight nor sound.

But at this moment a maid appeared with the announcement that 'Macpherson was wanting to see the colonel,' and presently the head stalker arrived in what John Bunyan calls a 'pelting heat.' Generally of a pale complexion which never tanned, he was now as red as a peony, and his gray beard made a startling contrast with his flamboyant face. As a rule he was an embarrassed figure inside the Castle, having difficulties in disposing of his arms and legs, but now excitement made him bold.

'I've seen him, Cornel,' he panted. 'Seen him crawlin' like an adder and runnin' like a sta-ag!'

'Seen who? Get your breath, Macpherson.'

'Him—the man—Macnab. I beg your pardon for my pechin', sir, but I came down the hill like I was a rollin' stone. . . . It was up on the backside of Craig Dhu near the old sheep-fauld. I seen a man hunkerin' among the muckle stones, and I got my glass on him, and he was a sma' man that I've never seen afore. I was wild to get a grip of him, and I started runnin', to drive him to the Cailleach's Well, where Miss Agatha and the gentleman was havin' their lunch. He seen me, and he took the road I ettled, and I thought I had him, for, thinks I, the young gentleman is soople and lang in the leg; but he seen the danger and turned off down the burn, and I couldna come near him. It would have been all right if I could have made the young gentleman hear, but though I was roarin' like a stot he was deafer than a tree. Och, it is the great peety.'

'Agatha, what on earth were you doing?' Janet asked severely.

Junius Bandicott blushed hotly. 'I never heard a sound,' he said. 'There must be something funny about the acoustics of that place.'

Colonel Raden, who knew the power of his stalker's lungs, looked in a mystified way from one to the other.

'Didn't you see Macpherson, Agatha?' he asked. 'He must have been in view coming over the shoulder of Craig Dhu.'

It was Agatha's turn to blush, which she did with vigour, and, to Mr Bandicott's eyes, with remarkable grace.

'Ach, I was in view well enough,' went on the tactless Macpherson, 'and I was routin' like a wild beast; but the twa of them was that busy talking they never lifted their eyes, and the man, as I tell you, slippit off down the burn. It is a grea-at peety, whatever.'

'What did you do then?' the colonel demanded.

'I followed him till I lost him in that awful rough corrie. . . . But I seen him again—ay, I seen him again, away over on the Maam above the big wud. Standin', as impident as ye please, on the skyline.'

'How long after you lost him in the corrie?' Janet asked.

'Maybe half-an-hour.'

'Impossible,' she said sharply. 'No living man could cover three miles of that ground in half-an-hour.'

'I was thinkin' the body was the Deevil.'

'You saw a second man. John Macnab has an accomplice.'

Macpherson scratched his shaggy head. 'I wouldn't say but you're right, Miss Janet. Now I think of it, it was a bigger man. He didn't bide a moment after I caught sight of him, but I got my glass on him, and he was a bigger man. Ay, a bigger man, and, maybe, a younger man.'

'This is very disturbing,' said Colonel Raden, walking to the window and twisting his moustache. 'What do you make of it, Nettie?'

'I think the affair is proceeding, as generals say about their battles, according to plan. We didn't know before that John Macnab had a confederate, but, of course, he was bound to have one. There was nothing against it in the terms of the wager.'

'Of course not, of course not. But what the devil was he doing on Carnbeg?—There was no shot, Macpherson?'

'There was no shot, and there will be no shot. There was no beasts the side they were on, and Alan is up there now with one of James's laddies.'

'It's exactly what we expected,' said Janet. 'It proves that we were right in guessing that John Macnab would take Carnmore. He came here to-day to frighten us about Carnbeg—make us think that he was going to try there, and get us to mass our forces. To-morrow he'll be on Carnmore, and then he'll mean business. I hoped this would happen, and I was getting nervous when Agatha and Mr Bandicott came home looking as blank as the Babes in the Wood. But I wish I knew which was really John Macnab—the little one or the tall one.'

'What does that matter?' her parent asked.

'Because I should be happier if he were tall. Little men are far more cunning.'

Junius Bandicott, having recovered his composure, chose to be amused. 'I take that as a personal compliment, Miss Janet. I'm pretty

big, and I can't say I want to be thought cunning.'

'Then John Macnab will get his salmon,' said Janet with decision.

Junius laughed. 'You may bet he won't. I've gotten the place watched like the Rum Fleet at home. A bird can't hardly cough without its being reported to me. My fellows are on to the game, and John Macnab will have to be a mighty clever citizen to come within a mile of the Strathlarrig water. Nobody is allowed to fish it but myself till the 3rd of September is past. I reckon angling just now is the forbidden fruit in this neighbourhood. I've seen but the one fellow fishing in the last three days—on the bit of slack water five hundred yards below the bridge. It belongs to Crask, I think.'

Janet nodded. 'No good, except with a worm after a spate. Crask hasn't any fishing worth the name.'

'I saw him from the automobile early this morning,' Junius continued. 'Strange sight he was, too, dressed in pyjamas and rubbers, flogging away at the most helpless stretch you can imagine—dead calm, not a ripple. He had out about fifty yards of line, and when I passed he made a cast which fell with a flop about his ears. Who do you suppose he was? Somebody from Crask?'

Janet, who was the family's authority on Crask, agreed. 'Probably some English servant who came down before breakfast just to say he had fished for salmon.'

After tea Janet went down into the haugh. She met old Mr Bandicott returning from the Piper's Ring, a very grubby old gentleman, and

a little dashed in spirits, for he had as yet seen no sign of Harald Blacktooth's coffin. 'Another day's work,' he announced, 'and then I win or lose. I thought I had struck it this afternoon, but it was the solid granite. If the fellow is there he's probably in a rift of the rock. That has been known to happen. The Vikings found a natural fissure, stuck their dead chief in it, and heaped earth above to make a barrow. . . .'

Down near the stream she met Benjie, who appeared to have worked late at his besoms, bumping over the moor to the road. He and his old pony made a more idyllic picture than ever in the mellow light of evening—almost too conventionally artistic to be real, she thought, till Benjie's immobile figure woke to life at the sight of her and he pulled his lint-white forelock. 'A grand nicht, lady,' he crooned, and jogged on into the beeches' shade. . . . She sat on the bridge and watched the Raden waters pass from gold to amethyst and from amethyst to purple, and then sauntered back through the sweet-smelling dusk. Visions of John Macnab filled her mind, now a tall bravo with a colonial accent, now a gruarled Caliban of infinite cunning and gnome-like agility. Where in this haunted land was he ensconced—in some hazel covert, or in some clachan but-and-ben, or miles distant in a populous hotel, ready to speed in a swift car to the scene of action? . . . Anyhow in twenty-four hours she would know if she had defeated this insolent challenger. On the eve of battle she had forgotten all about the stakes and her new hunter; it was the honour of Glenraden that was concerned, that little stone castle against the world.

(Continued on page 152.)

LOST IN THE CENTRAL TABLELANDS OF BRAZIL.

By CARLOS HERNAL.

I.

AFTER an unsuccessful expedition of pearl-fishing in the lakes formed by the Araguaya—one of the most beautiful of Brazilian rivers—I paid off my Indian crew and resolved to hunt twenty miles inland on the western banks. On the other side of the Araguaya River begins the 'Wild West,' with immense plains, unknown and mysterious, the home of the untamed Chavante Indians. Two or three huts of cattle herdsmen, forty to fifty miles apart, are the farthest outposts of civilisation.

One such hut I proposed to make a centre of operations, but the cowboy was busy bringing in cattle to form a drove which was to be sent to Goyaz; therefore he could not go with me as a guide, and I was left to myself.

The immense valley of the Araguaya River is nearly all flat. Dark virgin forests indicate the

presence of lakes and lagoons; extensive prairies of evergreen luxuriant grass vary with thin dry woods in ever-changing scenery; changing, and yet so desperately alike as to be extremely dangerous to get lost in.

The next day I started out alone. The cowboys informed me that no jaguar had been noticed in the vicinity, so a gun was sufficient, with the addition of a long bush-knife. The cattle-trails, those unique ways of communication, led through a thin dry wood to a beautiful prairie. Far away a black forest contrasted with the deep blue sky, this place having been indicated to me as the rendezvous of all sorts of birds and game. Following its direction, I had not gone far when I heard a strange noise, faintly at first, increasing when the wind turned, and deafening as I drew near the forest. Cautiously I stole through. A glade opened sharply—thence came the noise; it was the

lagoon. Approaching carefully, I beheld a glorious sight. In the gleaming waters hundreds of snow-white garças and garrettas, rose-coloured spoonbills, Eurypyga helios, gray herons, and other birds—presided over by the big jaburus, close relations of the African marabou—had assembled and were making that strange noise, which could be compared best to that made by half-a-dozen jazz bands all turned crazy at the same time.

Every year at the end of the rainless season the lagoons dry up, and the great quantity of small fry that entered them during the flood become an easy prey to these birds. All the different kinds gather in these lagoons. As soon as one is empty of water and of fish they fly to another, and thus the noisy feast lasts more than a month.

My gun went off, but too high! The birds rose in the air like a large cloud, circling over the lagoon for a while, and then set off for another near by. There I went after them, and succeeded in bringing down two beautiful garrettas, which produced a fine bunch of delicate egrets.

II.

Early next morning I was on the same way, and, getting near, the wild music told me that the feast was on again. This time I brought down six garças and two rose-coloured spoonbills. The lagoon was drying fast and the water formed pools here and there. I waded knee-deep through the bog to secure the birds. Passing one of the pools, I saw what I thought to be the head of a small caiman right at my feet, but, as they are quite harmless, I paid no heed and went on. Having now secured the last bird, I returned the same way and noticed that strange triangular head still on the same spot, below the water. Passing on slowly with the head now behind me, I was trying to make it agree with that of a caiman, when suddenly, like a flashlight, the thought that it must be a sucury (giant water snake) pierced my brain, and in the same fraction of a second I turned round. . . . Only two yards distant was the monster, erect, stalking out of the water, with open mouth and piercing eyes, about to throw itself like a lasso over me—and once in that deadly embrace there would be no escape from being helplessly crushed. Fortunately, the reptile is a perfect coward, and before I was able to get the gun ready it shrank back. I shall never forget the terribly wicked glance it shot at me out of its large black eyes.

The sucury (*Boa anaconda*) is without doubt the largest existing snake. Larger than the python, it attains up to fifteen yards in length, and even more. It lives in the lakes, close to the drinking-places of animals, where it lies awaiting its prey, and woe to the tapir, stag, or peccary that is surprised by this treacherous monster. Like a spring it darts upon its

victim; with its huge jaws well provided with long hooked teeth it seizes the prey, at the same time lassoing and crushing it. The largest of these reptiles will attack successfully even cattle. Several eye-witnesses have described this interesting scene to me. The sucury waits patiently for weeks, even months, its previously chosen victim, and at a favourable moment bites itself into the neck of the unfortunate old cow, or the inexperienced heifer or stirk. The horn-like end of its tail is firmly hooked round the foot or the trunk of a tree. The animal, wild with fear and pain, dashes ahead, but the monstrous reptile dilates, extending with astonishing elasticity, until it becomes as thin as a ship's hawser. The unlucky animal, now half exhausted, is pulled back like a mouse by the formidable strength of its foe. This is repeated until it is completely exhausted, when the reptile, letting go its hold, suddenly encircles its prey and crushes it to death. After having broken all the bones, till the animal forms one hapless mass, the sucury then starts deglutition, the head and horns remaining out of the mouth until they rot and fall off. Repeatedly the ugly monster has been encountered by cowboys in this position and killed. Its scaly skin is of a dirty yellow colour, changing to brown and dotted with large round black spots. This was my first experience with one of these horrid snakes, and a lesson to be more careful in the future.

III.

After a few days I knew the region all round for ten miles, and for a short time was perfectly at ease. One afternoon I resolved to visit two lagoons close together, only two miles from the hut. It was a very agreeable sight—the lagoon bordered by graceful palms, in its centre a flock of white garças and in their midst a stag—but before I could get near, stag and garças were off to the other lagoon. The two lagoons formed a sort of V, and, instead of going where they joined, I went in the opposite direction. After a while I began wondering at the long distance, and finally, growing uneasy, I climbed a tree and saw what I supposed to be the palms of the lagoon at a good distance; but when I got there I saw they were quite different. I realised then that I had lost myself.

Following a westerly direction, I cut through a very extensive thin wood, which gradually gave way to a virgin forest, indicating the vicinity of a lagoon. It began to rain now and soon I was drenched. My boots lost their soles and I had to throw them away, and the thorns tore my wet clothes to rags. A very pleasant situation I was in; wet, without boots, my clothes torn, without a match, lost in a virgin forest, and with only two cartridges left in my gun!

The sun was low when I came to another

lagoon. And what a lagoon! I immediately recognised it by the description I had heard of it as the 'Lagoa do Inferno' (the Lagoon of Hell) about ten miles from the hut. This lagoon fully deserved its name, and would well have illustrated the Valley of the Shadow and its quagmire in Bunyan's *Pilgrim's Progress*, or would have served equally well for Milton's *Paradise Lost*, or Dante's *Inferno*.

The sun was slowly sinking behind the dark forest, and the highest trees cast their long shadows across 'Hell's Lagoon,' all covered with reeds, hiding its black hideous water. A small island in the centre stood out sharply against the creeping darkness, and it was now time to look out for a place where to pass the night. There were a few withered trees near by, and I resolved to climb one of them. It seemed a good idea, inasmuch as a couple of garcas and a wild duck had already chosen a similar lofty abode in an adjoining tree. When I came up they were somewhat upset and, I believe, a little shocked at the strange intruding monkey they saw for the first time in their realm. They looked at each other, and then at me in a reproachful manner, and I expected they would ask me to explain such bold housebreaking conduct, but after a while they subsided and made no more fuss about it.

I did not like this place, because it was impossible to keep away the mosquitoes, and there came also a deep howling from the forest—the howling of wild boars. As these are always followed by the jaguar, I thought of leaving my feathered friends, for that 'cat' is a good climber and I would rather meet him on the ground. Some distance away I saw a grove of high palms that looked like a huge alley. Palms are always a pleasant sight, and, wherever they grow, add to the charm of the scenery, but these immensely high and dense palms formed a dome which the sun could not pierce. Such was the aspect of this grove, which might be fitly termed the peristyle of the 'Lagoa do Inferno.' There I passed the night on a heap of withered palm-leaves, with my gun at my side, and kept awake by the rain and swarms of gentle mosquitoes that were more eager for my blood than the jaguar, of which, fortunately, I neither saw nor heard anything.

IV.

I had ample time to think, and arrived at the conclusion that if ever I was to come out of this situation I should have to go east. As soon as the sun looked over the forest, which encircled this 'Hell' like an immense black wall, I started, having had for breakfast the same as for dinner—a little brackish water. Clouds soon covered the sky. After some hours of walking, I arrived at a lagoon, which I recognised with bitter disappointment as being the very one I had left. I now grew desperate

it seemed to me that this 'Hell' had some magic power to attract its victims, but I was fully determined to get away from it, inasmuch as I had never heard that anybody went to a place with such a name before leaving this world. When the sun pierced the clouds for a moment I started again, and whenever it hid I was careful to hew marks on the trunks of trees pointing in the direction I was to follow. Some hours afterwards the forest grew thinner, and, walking on with sore feet and clothes torn into rags, I came to a very narrow glade, and plunged into the forest again with greater confidence. The sun was low when I hit a trail and noticed the track of a horse. On I tramped till another glade opened, narrow and long, but after a while it closed and the trail disappeared. On my turning back, the glade widened into a prairie and the trail led to a lake. Here I quelled my burning thirst and searched for a passage, but there was none. Then, noticing a forest on my right, I again found the trail, which was leading to a lagoon behind. Drawing near, suddenly I noticed between the reed bunches of the lagoon two yellow bulks. Jaguars! was my first thought, and only one cartridge left! Remaining motionless, I observed them for a good while through the telescope, but strangely enough they did not move; neither could I see their heads. Creeping cautiously nearer, I then noticed brown and black stripes running in zig-zags horizontally across their yellow bulks, but still I could see no head or feet, nor could I notice any movement.

As the sun was setting, it was evident that I should again have to pass the night in the open, for the trail now led on to another forest, which I dared not enter at night. I reflected that it would be better to wait until morning, now I felt confident of being on the right way, and I did not care whether it took me a day longer to get to the hut. I was feeling very tired and my stomach cried indignantly for food, but I could pay no heed to it as the investigation of those enigmatic animals was more important.

A few yards ahead, on the border of the lagoon, which was dry, stood a few trees with low branches. Noiselessly creeping up to them, I climbed one, and then I discovered that the enigma was a sucury, but of such size as I never had seen before. The reed bunches had concealed parts of its body, so it gave the impression of two jaguars from afar. It was a female, of a length impossible to calculate with accuracy, but I estimated it at from 15 to 20 yards, and her thickness at about 25 to 30 inches. Her head was half hidden, and at the end of her tail I saw a kind of tube like a piece of pipe, and noticed distinctly three young snakes, her offspring, entering and coming out again. It was a very strange spectacle.

Several times I rubbed my eyes to make sure I was not dreaming, for I almost seemed at that moment to be living in the prehistoric epoch. This monster was of a kind that has never been described by any naturalist. I was much grieved at not having my Winchester at hand, and dared not approach her with the only shot I had left in my gun.

It was now getting dark and I retired a hundred yards from the lagoon to the prairie. Cutting a few palm-leaves in the forest near by, I brought them there to pass the night, but, tired as I was, I could not sleep owing to the mosquitoes that were after my blood. At dawn I resumed my walk; after crossing the forest I noticed that the tracks increased, and with them grew my hopes. Suddenly I heard a shout far away. My heart leapt with joy, and never in my life have I opened my mouth and shouted so long as I did at that moment. I

was answered, and then I fired my last shot. Soon the men came into view. They were the cowboys, who had been searching for me ever since I had been lost. Their pleasure at my return was as great as my own, for they had given up hopes of finding me. I got on horseback and after a short time reached my destination. They gave me some food and I told them the story.

When I came to the big snake I suggested going back right away, forgetting that I was tired. We mounted, but when we came to the lagoon the reptile had gone, probably to its hiding-place in the lake. We found, however, its track, like a large band on the bog, about 16 inches wide. The cowboys had never seen such a formidable sucury and were much astonished at the extraordinarily large track. We all felt disappointed that we did not get the skin of this 'prehistoric' monster.

PETER WAS SINGLE.

PART V.

XV.

THE famous specialist raised a perfect hand and smiled at Peter in a puzzled fashion. 'But, my dear sir, you are labouring under a very grave misapprehension,' he declared. 'I remember Miss Slade quite well. Undoubtedly her case is serious—something more than serious; but hopeless—that is a word we doctors never use. While there is life there is hope.'

Peter gave a great gasp of relief and dropped his hat on the expensive carpet. 'I—I shall be very grateful if you will tell me exactly what is required—what can be done for her—'

The famous specialist smiled again—rather sadly this time, for he was a busy man. He nodded briefly, and motioned Peter to a chair. 'First and foremost, Miss Slade is not incurable. You can make your mind easy on that score at once. Her own doctor has communicated with me, and I understand that she will be moved to a sanatorium sometime within the next two weeks. Her treatment will, in all probability, cover a period of, roughly, two years. Given the will to live, I believe a complete cure will be effected. It is of course useless to attempt to disguise the fact that money plays an important part in matters of this sort.' He paused significantly.

'You mean,' said Peter, 'that if Miss Slade could afford—'

'Precisely,' interrupted the famous specialist. 'Miss Slade interested me, and I have a certain amount of—ah—influence with a famous private sanatorium. Had Miss Slade's means been less

—er—less limited it would have given me great pleasure to use that influence on her behalf. The place she is going to is a public institution, and while everything possible will be done for her, constant individual attention such as I should have liked her to receive is quite out of the question. However, the chief difficulty will arise when she is discharged in about two years' time, for no matter how complete the cure, I must warn you, as I warned her, that she will never be out of danger while she remains in this country. Immediately she leaves the sanatorium it will be essential for her to make her home in some land with a dry climate. There only will she be safe. It is this fact, probably, that forces her to take so hopeless a view of her own case.'

Peter rose to his feet. 'Thank you, doctor. I shall have to see what can be done.'

The famous specialist also rose and held out his hand. 'Don't forget your hat, Mr Golding,' he murmured, ringing for the maid.

XVI.

A few days later Peter sat at his desk in the warehouse, going through a pile of complaints and ordinary correspondence. Progress was slow, however, for his mind was not on his work. With unseeing eyes he stared at a typewritten letter, noticing subconsciously through his sense of touch that the paper was of excellent quality. He shook his head impatiently, and the artistic heading of the letter between his fingers caught his attention.

'Slater, Potter & Slater of Cape Town,' he said aloud. 'This means we are going to be busy. Cape Town!' he repeated, suddenly

struck with a new thought; 'Cape Town, *South Africa*. The very thing!' He sprang to his feet and went in search of Mr Hughes, and a little later he was tapping at the door of the private office.

Mr Reginald stood with his hands thrust into his pockets, staring out of the window. 'Sit down, Golding,' he said as Peter entered. 'As a matter of fact I was just going to send for you.'

Peter seated himself.

A few moments passed in silence, and then Mr Reginald turned suddenly and faced Peter across the table. 'Look here, Golding, something very terrible has happened. I am more anxious than ever that you should sign that agreement. You are not a good business man, but you have brains, and I'll pay you anything you like in reason—er—business isn't everything, you know.'

Peter stared at him in amazement. 'I'm sorry,' he said, finding his tongue at last, 'but I'm afraid it is impossible. Something has happened to me too; I shall emigrate shortly.'

Mr Reginald, who had remained standing, began to pace nervously about the office. 'I wish you would reconsider this, Golding.'

Peter shook his head, and then a new idea occurred to him. 'I could stay for a few months, even a year—that would give you a chance to find somebody suitable for the position.'

Mr Reginald looked distinctly relieved. 'I'm glad to hear that, Golding, very glad indeed. Are you thinking of going out to one of our colonies?'

'South Africa,' answered Peter promptly. 'I—I was thinking,' he went on a trifle nervously, 'that you might perhaps be able to help me—that's what I came to see you about, really.'

Mr Reginald inclined his head. 'In any way I can, Golding; only too pleased.'

'Well, it's like this: I've heard it said many a time in the warehouse that this firm—our firm, I mean—has a more than ordinary interest in the big Cape Town mail-order house, Slater, Potter & Slater, Ltd. They say that you went to South Africa some years ago to study their special requirements.'

Mr Reginald smiled, and darted a curious look at Peter.

'I thought that if you put a good word in for me they might be prepared to give me a job—any sort of a job.'

'That's a good idea,' Mr Reginald admitted thoughtfully. 'Coming to think of it, you'd probably be very useful to us on the other side; and your letter-writing ability will be very valuable in a mail-order house. Yes, I think I can arrange that for you, Golding.'

'Thank you, Mr Reginald,' said Peter simply, and rose to his feet.

'One moment, Golding—there is this other matter. Miss Slade, as you know, has left us; she will never return. A communication from her doctor caused us to make enquiries, and I was terribly shocked to learn that the poor girl is in a very critical condition. We had not the faintest idea of the truth.' Mr Reginald choked, a spasm of pain contorting his face for the moment; he began to pace restlessly.

Peter watched him with perplexed eyes. His employer's emotion was obviously genuine; he was profoundly moved. Apart from business, Mr Reginald was evidently a human being.

'Of course, Golding, we are in no way responsible for this unfortunate affair. Miss Slade inherited the dreadful disease from her mother, but the doctor thinks that the conditions under which she worked here did not give her a fighting chance, as it were, and—and I think that there may be something in what he says.'

'There undoubtedly is,' said Peter, a flood of resentment thickening his voice.

Mr Reginald nodded. 'That is another reason why I wanted you to remain with us. You are *not* a business man, but you could help to improve conditions without disorganising the whole system. Everything possible is being done for Miss Slade. We have instructed every one concerned that no expense must be spared. Next week she will go into a private sanatorium, which has been recommended to us by a famous specialist. Meanwhile, a trained nurse has taken command.'

'The firm is very generous,' murmured Peter, half in gratitude, half in bitterness.

Mr Reginald looked a trifle uncomfortable. 'This dreadful thing has moved us deeply, Golding, and my wife has interested herself in Miss Slade. To be quite candid, Golding, there are certain phases of the business which my wife has long wanted to see altered—women, you know, do not understand business. She knows that I have practically a free hand in the warehouse, and—well, she insists that certain changes be made without delay—nothing drastic, you understand, Golding; I will not tolerate a complete upheaval, but slight changes in certain directions will, I am convinced, be all to the good. After all, one has to humour one's wife occasionally.'

Peter smiled. 'One has,' he admitted, rising again and moving to the door.

Something in the young man's tone arrested Mr Reginald's attention. He looked up as the door closed behind Peter.

'I'm sure Golding told me he was single!—I wonder—?'

XVII.

They left the church in silence, and by common consent moved away from the thin stream of other worshippers.

'My mother would have loved you, Peter,'

said the girl, when they reached the lonely grave in the quiet corner of the churchyard, but Peter did not hear, for only her heart had spoken. She stooped and began to arrange the flowers. He watched her thin nervous fingers, and saw how loosely the plain gold band hung on one of them. . . .

He raised her gently, and hand in hand they left the churchyard.

It was Sunday, Spring was in the air, and the same thought was in the heart of each.

'Let us not waste to-day, for to-morrow we part.'

Suddenly Peter spoke aloud. 'But not for long,' he said.

She turned a radiant face to him. 'Listen,' she whispered. 'The birds are twittering Spring's song of hope.'

They drew closer together, and side by side went bravely on through the silent fields into the future. . . .

THE END.

THE MONTH: SCIENCE AND ARTS.

PRESERVATIVES AND COLOURING MATTER IN FOODS.

WHETHER preservatives and colouring matter in foods are harmful or harmless is a matter of vital consequence to all. This question has been inquired into at great length for the Ministry of Health by a departmental committee, which has recently issued a final report. It may be stated at once that little evidence is forthcoming that any one has been, or is being, actually poisoned by preservatives or by colouring matter in foods. At the same time it seems probable that a certain amount of dyspepsia is traceable to this cause, while the drugs used may seriously affect infants and invalids. An important point brought out in the report, which will surprise many, is that almost all foods can be kept fresh long enough without preservatives, even when imported from the antipodes. Some preservatives are more harmful than others. Formaldehyde and its derivatives are deemed to be the worst in use, but there appears to be no reason why this drug should be employed. Boron preservatives and salicylic acid and its salts are less harmful, and these, especially the former, are the commonest in use. The least harmful preservatives are benzoic acid, sulphurous acid, and their salts. Preservatives in milk are now illegal, and the committee consider that they should be prohibited in cream after a sufficient period of notice. Most of the butter imported from European countries contains no preservatives. Of that sent to us from New Zealand and Australia, samples taken showed that 20 per cent. and 10 per cent. respectively were free from preservatives, and the proportion is growing. In view of these facts it is considered possible to dispense with preservatives in butter from all countries. No less than 140 grains of boric acid to the pound has been found in butter, against a maximum of 35 grains said to be necessary by trade witnesses. Samples of margarine have been tested which contained 175 grains of boric acid to the pound. Here, again, the committee deem preservatives to be

unnecessary, and recommend their prohibition. In spite of the fact that many sausages are made without preservatives, and that several medical officers advocate prohibiting their use, the committee, in the absence of refrigerator vans for transport and cold chambers in retail shops, recommend that a small amount of preservative be permitted. But they suggest the use of sulphites, as being less harmful than boron and equally effective. No preservative is employed in the curing of bacon, but borax is used in some countries to keep good that exported, being dusted on or packed in the boxes. But this is not considered necessary, even for bacon and ham imported from America and Canada. It is said to be a common practice for butchers to treat meat with preservative preparations, to make it keep longer, or to mask the odour of incipient putrefaction. The committee recommend that the treatment of meat with any preservative substance whatever should be forbidden. Most of us have thought that dried fruits were entirely free from preservatives; but such is by no means the case. Apricots, peaches, prunes, and similar fruits are treated with the fumes of burning sulphur both before and after the drying process, the result being that considerable amounts of sulphur dioxide are absorbed. Neither dried eggs nor frozen eggs contain any preservative, but the yolks of imported eggs are treated with boron preservative in the country of origin, while the whites are dried, the two being reconstituted in this country to produce 'liquid egg.' It is considered that preservation by freezing would meet all demands. The most harmful colouring matter used is sulphate of copper for canned vegetables, especially peas. This is deemed to be quite unnecessary, and is prohibited in Denmark and the United States. Among foods which one would not suspect of being coloured are biscuits, jams, custard-powder, and egg-powder. With regard to the last two, custard-powder may be coloured starch, while egg-powder is frequently ordinary baking-powder with yellow colouring matter. Sausages and fish paste are also often dyed.

A NEW AID TO THE DEAF.

All aids to the deaf that have hitherto been placed on the market have been percussion instruments, in which a vibrating diaphragm communicates its vibrations to the drum of the ear, thus giving rise to the sensation of sound. There is a danger, however, that in some cases, at least, the remedy may eventually accentuate the trouble by the violence of its action, and thus result in the deafness becoming progressively worse. This danger seems to be avoided in a new aid to the deaf which we have recently tested. It operates, not by percussion, but by the almost infinitesimal changes of temperature set up by means of a microphone of special design in a tube small enough to rest quite comfortably and inconspicuously in the ear. Hence the new appliance may be called a thermophone or a pyrophone. Those who have tried the instrument comment favourably upon the absence of accompanying noises, the distinctness of the articulation, and the 'naturalness' of the sounds heard by means of its help, there being an almost entire absence of any 'metallic' effect. The device does not pick up general conversation, as the speaker has to speak into a mouth-piece, but as a means of communication between two people, or for use in churches or other public buildings where the system is installed (in which case the mouth-piece may be placed in any convenient inconspicuous position at a distance of a few feet), it appears to have before it a wide field of usefulness, especially as its price is very moderate.

AN EFFECTIVE WIND-SCREEN WIPER.

There are no half-measures about a wind-screen wiper for cars in wet or snowy weather that has lately been brought out. It wipes the whole of the top panel, moving slowly to and fro from end to end. A wind-screen wiper is now considered almost a necessity for an all-weather car. Until the advent of the type referred to most of these devices have been of the radial description, which clean a semi-circular patch. It is true that at least one operates over a rectangular area, but this only extends to the driver's half of the upper panel. These wind-screen wipers are squeegees, similar in principle to those which are used for cleaning muddy pavements. They are worked by various means—some by the suction of the pistons, others by gear from the road transmission. The new device, which wipes the whole of the top panel, is driven through skew gear by a tiny electric motor. This form of drive has the advantage of giving a constant wiping speed regardless of the speed of the car. The squeegee is carried by a vertical arm, of which the upper end is mounted upon a horizontal spindle extending along the top of the screen. This spindle has two screw threads cut into it—one right-handed, the other left-handed.

It is turned in one direction by the electric motor. When the squeegee reaches either end of the screen, having been moved thither by one screw thread, it is changed over automatically to the other screw thread, which carries it in the opposite direction; and so it continually moves to and fro so long as the motor is running. When not required, the wiper is stopped at one end of its travel. The spindle is protected from the weather by a tube with a slot along its lower side for the squeegee arm. The motor is mounted just inside the screen on the off side, the spindle passing through a hole in the glass. Very little electric current is required, the demand being well under two amperes on a 12-volt circuit.

A NEW FIRELESS COOKER.

Of late years what are known as fireless cookers have come into widespread use. The idea was borrowed from the hay-box, which has long been a popular Norwegian method of cooking food and keeping it hot. These fireless cookers are based on the prevention of radiation by heat insulation. If radiation could be entirely avoided, a boiling food would continue to boil without any source of heat; and this condition is aimed at in the fireless cooker. One device of this description, however, differs from the general run of such contrivances, in that massive heated iron discs are put in with the food and obviate any need for a preliminary heating over a gas ring for from five to ten minutes. The fireless cooker referred to takes the form of a rectangular box with one or more big round holes to receive the cooking utensils. The box is made of galvanised steel, and the spaces between the walls of the box and the linings of the holes are filled with heat-insulating material. The lid of the box is also heat-tight, being in two thicknesses of sheet steel with a layer of insulating material between them. In addition to this provision for preventing the escape of heat there is a circular heat-insulated lid for each hole.

This cooker has the advantage over others in being able to bake and roast as well as to stew. For baking or roasting, the *modus operandi* is as follows: Two of the iron discs are made hot over a coal fire, a pressure oil-stove, or a gas-ring, this operation taking about twenty minutes. The discs are lifted by detachable handles, and one of them is placed at the bottom of the cooking hole. The food to be cooked in its pot is then inserted, followed by another hot disc, which is placed over the lid of the pot. Finally, the insulated lid is put over the top of the heated disc, and the lid of the box shut down. For stewing only the bottom hot disc is used.

These fireless cookers are made in three sizes, the largest having a hole for a cooking pot 10 inches in diameter by 7 inches deep, and

two smaller holes for pots 8 inches in diameter and 6 inches deep. A smaller size has one large and one small hole, and another model is made with only the large hole. The cooking pots are made either of tinned steel or of aluminium. The device can, of course, be used without the heated discs, when the effect is similar to that of the ordinary fireless cooker or hay-box, which continues the cooking after it has been begun over a fire or a gas ring, or keeps the food hot for hours after it is cooked.

FIXED SCREW-JACKS FOR CARS.

One is sometimes tempted to wonder when the approach of motor cars to finality in design and accessories will be indicated by a lessened flow of new devices. At present there is no sign that inventors in this line are suffering from exhaustion. Among the latest novelties is a permanently-fixed jack at each side of a car which raises both wheels clear of the ground at the same time. Attached to the frame of the chassis by a special bracket, each jack is fixed near the middle of the car. The upper portion consists of a steel tube which houses the screw, and terminates at the bottom in a casing for a bevel gear. By the turning of a toothed bevel wheel which forms the nut for the screw, the screw is forced downwards until the swelling pad at the bottom rests on the road, when further turning raises the side of the car. The bevel wheel is turned by a bevel pinion mounted on a horizontal spindle which is carried in a tube clipped to the underside of the running board. To operate the jack a key is inserted into the tube, and this engages with the end of the bevel-pinion spindle, when it is the work of a few seconds to jack up the car. There is no stooping or grovelling, as with a loose jack; and as both wheels are raised, the front and back wheels can be quickly interchanged. Washing is also facilitated; and it is claimed that the raising of one side of a car on its jack is an effective guarantee against theft. The gears are entirely enclosed, and the ends of the operating-spindle tubes are stopped up with rubber plugs when the jacks are out of use. The device is easily fitted to any make of car, modifications and adjustments being provided to suit all conditions.

A NEW AERIAL FOR LISTENING-IN SETS.

Whether the outside aerial in a straight length and mounted at a height will maintain its popularity in the face of competitors is perhaps open to doubt. If it does, a recently-invented form is likely to take the place of the plain wire. This consists of a strip of gauze made from high tensile bronze wire. The makers claim that by using this aerial the signal strength and clearness are increased up to 50 per cent. compared with the results from ordinary wire. That numerous tests have

shown the superiority of the gauze aerial over the plain wire is indicated by a guarantee to refund the purchaser's money if the results are not as represented. These aerials are supplied in lengths of 50 feet, 75 feet, and 100 feet. An end terminal for the down-lead and insulators ready for erecting are included with the two longer lengths. The gauze strip is supplied in widths of $\frac{1}{2}$ inch or $\frac{3}{4}$ inch.

A NEW DEPARTURE IN DOMESTIC TRAYS.

Few domestic appliances have changed less within living memory than trays. Towards the end of last century they acquired handles by which to lift them, but this is the only modification of any consequence which has occurred. Recently the tray has attracted the attention of an inventor who has produced a pattern that constitutes a radical departure from previous types. The new model consists of two trays of the same size which are provided with a jointed aluminium frame that, when collapsed, holds the trays side by side at the same level, making practically one flat tray. By lifting the handle, however, one tray assumes a position vertically above the other. The two trays are connected together at each end by two links, which are vertical when the handle is lifted. These links are pivoted to the trays, and as they are parallel with each other, the moving tray always remains parallel with its confrère below it, and is, therefore, always level. One of the connecting links at each end is extended to a height equal to the distance between the links, and the tops of the long and short links are connected by bars which are pivoted to them at each end. As described so far, these bars would make the frame rigid, so that it could not be folded down to bring the upper tray level with and alongside the lower one. The bars are, therefore, hinged in the middle, so as to fold up as the upper tray is lowered. A handle between the ends of the long links serves to carry the trays with the one above the other, and also as a means of lowering the top one. The trays are made of wood, and are finished with transparent cellulose, which is not marked by hot plates or by any liquid, hot or cold, which may be spilt upon it. Although the 'two-tier' tray has been described, single trays with collapsible handles are likewise made; also three-tier trays. Except the last-named, they are constructed in two or three sizes. These trays are much more easily carried than the ordinary type, for only one hand is required, leaving the other free to open doors or to carry something else.

STROPS FOR SAFETY-RAZOR BLADES.

With the advent of machines for stropping them, blades for safety razors need no longer be thrown away when their edges become dull. In one machine the actual stropping is done

by leather strips wound upon small Duralumin rollers in the form of very coarse, square screw threads. Two rollers are fixed side by side in each half of the device. Tiny gear-wheels at one end, which mesh with each other, compel the rollers to turn in unison, although in opposite directions. The two halves of the machine are hinged together at the gear-wheel ends, while one half is fitted with two pegs which match the holes in the blades, and thereby hold them in position. One roller spindle is extended and provided with a little handle. When a blade is inserted and the upper half of the machine is closed down upon the lower, the edges of the blade are lightly nipped between the upper and lower rollers at each side. Moreover, the gear-wheels of these rollers intermesh. The result is that, when the handle is turned, all four rollers rotate together, and away from the edges of the blade; while the leather strips, being helical in form, travel along the blade edges, and very closely imitate the heel-to-toe stropping action of the professional barber. The roller cases forming each half of the machine are stamped from sheet metal and nickel-plated.

Another device for this purpose which we have thoroughly tested and found very effective is of a quite different kind. Fixed on one side of a rectangular framework is an emery block for honing the blade; on the opposite side is a leather pad for stropping it. The blade to be sharpened is fitted into a holder, which is then dropped into position in a 'carrier' running over the block of emery. The carrier, on being moved backward and forward, automatically brings the four sides of the two cutting edges of the blade into successive contact with the emery at the correct angle. When the backward and forward movement has been repeated a sufficient number of times (say 20), the holder is slipped out of the carrier, and is then inserted into another carrier on the other side, which similarly brings the blade into contact with the leather pad, thus effectively stropping it. The whole process takes but a very short time, and its repetition at suitable intervals prolongs the life of the blade almost indefinitely. A special holder is required for each kind of blade; otherwise the device is adapted to deal with any or every kind of safety-razor blade.

A NEW STAMP PAD.

A new stamp pad which has recently been put on the market has some novel and valuable features. A projecting flange running along the lower edge of the front of the containing box prevents the lid from being pressed down on to the pad and thus becoming soiled; at the same time it ensures that the box shall be easily opened. The hinge of the containing box is so constructed that the lid may be thrown right back, making it lie quite flat when the box is

open. The pad is of such a nature that it holds a very large quantity of ink, every fibre of the several constituents being made to contain its due quota. Below the pad proper is a layer of wood planed to the exact thickness required and coated with a special preparation to prevent absorption of ink. Above this are placed in order (1) a layer of felt; (2) a layer of thick blotting paper (to ensure equal distribution of the ink); (3) another layer of felt; and (4) a covering fabric of long-stapled sea-island cotton binding the whole together, and stretched so tightly that the upper surface of the pad is kept uniformly level. A distinctive feature of the containing box is that it is coloured to correspond with the ink to be used in the pad.

AN IMPROVED PRIMING PLUG FOR MOTORS.

Few will dispute the advantages of priming when it is desired to start a motor in a car on a cold day. It is not every motor that is fitted with compression cocks for the injection of petrol, and in the absence of these, the only course is to remove the sparking plugs. This, however, is obviated by the use of what are known as priming plugs. A recent pattern possesses several improved features. Of these the most important is the enclosing of the cup in a screw-on cap which prevents the entry of dust and the ejection of the petrol on the up-stroke of the piston when the engine is turned over. A terminal has also been provided which fits all regular cable terminals. A spigot in the centre of the cup reaches to the top, and is drilled to take a needle valve situated at the bottom of the hole. The hole is continued in a smaller size half-way down the plug, where it divides into two grooves that discharge the petrol just above the sparking points. Tiny holes are drilled at the root of the spigot, through which the petrol in the cup flows into the central hole and thence to the needle valve. The cap, to which the needle valve is attached, can be removed without loosening the terminal.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

*. * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.

Chambers's Journal

SEVENTH SERIES

MAN—OR BEAST?

By PATRICK RUSHDEN.

CHAPTER I.

I.

ARMINEL LEYTON, married during the War to her Peter, a major in a Gurkha regiment, had only been established as a mem-sahib for three months; but she had taken India to her heart from the first. It wasn't difficult to do at Dehra Doon—acknowledged to be one of the choicest stations in the whole peninsula.

She revelled in the picturesque native aspects of the new life; in the setting of the fertile Doon plain, bordered by both Jumna and Ganges; in the great green parade-grounds and splendid trees, and the riot of flowers in the bungalow gardens. To the north-east rose the mighty ramparts of the Himalayas, alluring, forbidding; while to the west the plain was bounded by the long, low range of the Siwalik hills, their outline here and there like the edge of a giant saw.

To-day, in response to a note from Arminel, Colonel Buxton, I.M.S., an old friend of Peter Leyton's, had come to tea with her. He had made a considerable name for himself in surgery and in X-ray discovery and invention; but his face was more suggestive of the philosopher than the scientist. The forehead was broad and low; the mouth generous, humorous, yet firm, under the clipped gray moustache; a touch of the visionary showed in the dark-gray eyes, which nevertheless could look as if they pierced to the marrow of things.

Buxton found Arminel entertaining a solitary guest, Captain John Leonard. Her husband had been kept late at the battalion office.

The youngster was stiff and shy, and his hostess rather obviously relieved by the colonel's entrance.

'So you've made your curtsy to the Siwaliks, Mrs Peter,' he said, taking the cup she held out. 'You know, don't you, that the name means "The Abode of Shiva"—the Destroyer? Was the great god in a friendly mood?'

'I've been there several times since I saw you,' she told him.—'Won't you smoke, Captain Leonard?'

'Well, what did you think of the Siwaliks?'

Her frank, brown eyes studied the colonel's

No. 741.—VOL. XV.

quizzical expression. 'They're very—queer. Queer from a distance—but much more so when one's in the middle of them.'

'The shapes of the hills?'

'Partly——' She hesitated; then, with the impetus of a long breath, decided on a plunge. Glancing almost deprecatingly at Leonard, she turned to Buxton. 'You'll laugh, but—there's something uncanny about those hills! You remember how keen I was to go? But after the first time I found I was always choosing another way when Peter took me for a run in a car. At last he spotted it, and thought I didn't trust his driving on that tricky road; so after that I used to pretend I was quite willing.' She glanced at Leonard. 'You mustn't tell Peter this!'

'Of course not!' with the first smile since he had come; an understanding smile, thought Arminel, encouraged.

'Of course we won't tell Peter,' endorsed the colonel. 'Peter, bless him, has no use for the uncanny.'

'I'm glad he hasn't!' said Peter's wife, with curious emphasis. Then she shook herself. 'Why should I be solemn about the Siwaliks? They're not nearly so solemn-looking as the Himalayas, but they—they intimidate me! It's the same every time—I feel *there's something there*.' She looked from one man to the other.

'I know,' said Buxton quietly, taking a cake. The other two gazed at him, and he returned Arminel's look humorously.

'You think I'm an imaginative ninny!' she threw at him, her pretty, changeful face alight with challenge.

'I said, "I know,"' remarked the colonel meekly; 'I meant, I feel the same.'

'You! Shake hands!' she cried, and they shook. Leonard smoked in silence but for an appreciative laugh.

II.

'What *is* it?' Arminel pursued; and again, 'What *is* it?'

'I don't know,' mused Buxton. 'Sometimes I think it's only because they're like the enchanted hills in a fairy-tale. They suggest dragons and ogres——'

[All Rights Reserved.]

FEBRUARY 7, 1925.

'I'm sure it isn't that. Three other people besides me feel—uncomfortable in them, and you—that makes four. I'm glad you're a man; all the rest of us are mere women!'

'Me too, please,' said a quiet young voice. Arminel faced round. 'You! Oh no, not you!'

Both men laughed.

'Why not, Mrs Leyton?' The boy was slightly pinker than usual. "'More things in heaven and earth," you know, and all that.'

'I thought——' She hesitated.

'That I thought only about ponies and polo, and that sort of thing? But I've thought about the Siwaliks too. They *make* you think.'

'They do—they do! But most men only think about the shooting in them, and to the women they're just a good place for picnics. How funny—we three! Now I don't mind—I'll tell you everything—it'll do me good. I hope Peter won't be back just yet—I'd have to stop; I should hate him to think I was a nervy idiot. . . . Well, the first time I didn't feel anything but just interest and excitement at the newness till we were through the Mohand tunnel. You know how the shapes of the hills get more weird after that, and the road more twisty. Peter drives awfully well—I wasn't a bit nervous. I loved the shapes of the peaks—those sugar-loaf ones—and the cliffs and the giants' fortresses; and the road winding between them, with sometimes hardly room for it, and sometimes a wide, dry river-bed between it and the hills; and the great flowering aloes and hanging creepers, and the funny trees one didn't know—I loved it all. But soon after the Mohand Pass I began to feel—*something*. Joseph—our "shover"—was in the back of the car, and I was by Peter. We were chatting and seeing interesting things—a peacock, a cheetal doe, and two mongooses. In the midst of it all I suddenly felt . . . It came upon me—I can't put it into words!'

'Have a try,' said the colonel.

' . . . I felt as if *something*, that wasn't man or beast, was there—filling the place with its influence. It seemed as if it was watching us. . . .' She hesitated. 'As if it was—what's the word?—omnipresent. Very nasty the feeling was. I knew the *Something* was aware of us, and *hated* us.' She shivered. 'And there was Peter, as gay as a bird, feeling absolutely nothing. It was so comforting!'

'And that's all?' asked Buxton.

'Not quite. On the way back we stopped at that little mud house with banana trees by it, not far from the tunnel—we wanted water for the car. A boy got some in a brass pot, and while it was being poured in, an old, old man crept down the path from the hut and salaamed to us. Peter spoke to him, and he began talking. I saw that Joseph was listening. He was educated in a mission school, and looks down

on the ordinary native, but he seemed rather intrigued with what the old man was saying. Peter grunted and grinned, and gave him a few annas when we went off. I asked Peter what he'd talked about, and Peter said, "Oh, he was telling me a fairy-tale!" and that's all he'd say. But I got it out of Joseph later.'

III.

'And what was the fairy-tale?' inquired the colonel.

'The thrill of it was, that the old man was in it! He began, Joseph said, by hoping the sahib would get out of the hills before dark. Peter told him there was a government notice near Mohand, warning drivers that they mustn't go through the pass after dark. He said, yes, but sahibs did go through too late, in spite of it, and sometimes their motors and gharries had an accident, and they were obliged to spend a night in the hills. Peter told him he'd spent many nights in the Siwaliks, camping; and the old man said, "The sahib is afraid of nothing, but may I tell him a true tale?" Then he said that when he was a small boy, he and some other boys from a village went one evening to stone down mangoes in a grove not far from a byroad. They hadn't meant to be out late, but it came on to rain hard, and they sheltered under the trees. A terrific thunderstorm broke over the grove, and they daredn't move. They were huddled against a tree-trunk, when, in a lightning flash, they saw "big, hairy men" coming at them from the jungle. They ran as fast as they could, but it was dark, and one little fellow was lame, and he fell. They heard him scream, but they were too terrified to stop till they got to the village. No one would go out that night—not even the lame boy's father. The next morning he and some other men went to the mango-grove. The boy wasn't there, and they thought he'd been carried off by a tiger or a leopard. After a while they found him. All his clothes had been torn off, and were shredded on the ground, but there was no blood, and he wasn't dead—not even wounded. He was "like dead," Joseph said. Some doctor was camping for shooting, not far off; he heard about the boy, and had him carried to his tent. The doctor did all he could to bring him to, but he died. I thought, perhaps, the "hairy men" were bears; but Joseph said there are none in the Siwaliks, and suggested dacoits. I told him there had been no dacoits there for eighty years, and anyway they wouldn't go for small boys; and then we got to the club.'

'I wouldn't put much faith in that yarn,' said the colonel; 'all natives exaggerate in telling you an occurrence. It's possible the boys saw langurs—those big, gray monkeys, and by lightning they looked bigger than they were. Probably the lame boy was delicate, and natives can be killed by sheer fright. I once had a

case of death from snake-bite; the snake wasn't poisonous, but the man believed it was!

'That's a comforting explanation of yours!' sighed Arminel. 'Mrs Penell says that the absolute belief of the natives, through thousands of years, that gods and devils lived in those hills has—I forget how she put it——'

'Made them alive there?' suggested Buxton.

'Something like that. Laid a sort of spell on the place, and conjured up evil things. She says that ages ago hermits and ascetics were the only people who dared to live in the Siwaliks. They intensified the spell by concentrating on devil-spirits and on their horrible gods and goddesses. . . . That those old ascetics had weird powers—black magic. But I don't believe in that sort of thing, or in "thought-forms" of heathen gods. It's the creepy feeling that the whole place—something that pervades it—is waiting to catch you unawares and destroy you. And somehow I know that *if* you're frightened, the danger comes nearer.'

The colonel nodded slowly, but smiled a little.

'You're very contradictory,' said Arminel reproachfully; 'you behave as if you do believe and yet don't!'

'Believe in what—Shiva and Co.?'

'Well, in whatever "It" is!'

'I'm afraid I always want proof before I say "I believe," Mrs Peter. Until then, I'm an agnostic—which means, "It may be so: I don't know."'

'That's all very fine, but at the beginning of this cheery chat you said you felt the same as I do about the uncanniness. You must have some sort of theory——'

'I think I shall call you "Mrs Portia," not "Mrs Peter,"' fenced Buxton, twinkling.

Leyton, tall, alert, and muscular, in khaki uniform, stood smiling between the door-curtains.

'Hullo, Peterkin!' greeted his wife; 'you're dreadfully late! I've been telling them about the things we saw in the Siwaliks, and—no, I forgot about those three lovely langurs in a tree!'

'That was the chief feature of interest, so far as I remember,' commented Leyton dryly.

'Yes, please; some fresh tea. You've an uncommon gift for telling a story, dear—always improves it to leave out the only purple patch.' They laughed in perfect understanding, and Arminel said, 'You're in a horrid temper, Peter, because you want your tea!'

IV.

Buxton gave Leonard a lift to the club when they left the Leytons' bungalow; he fancied the boy had looked at him as though he wanted his private ear.

'Odd—Mrs Leyton hearing that story,' he said as they started. 'As a matter of fact I

believe it's true, in the main. I had it when I was a youngster, from an I.M.S. colonel named Cole, a very senior man, who was in Lahore with me. He was the doctor who was camping in the Siwaliks when the thing happened. The boy was a weakling—epileptic, Cole thought. But there were curious features in the case. The child had unaccountable marks on him when found. I suggested lightning—it does freaky things—strips off clothing sometimes; but there was no trace of singeing. He was in an epileptic coma—had evidently had a fit, and died without becoming conscious. I purposely didn't tell Mrs Leyton I'd heard the story.'

'Of course not, sir; she's jumpy enough already about those beastly hills.'

'Why "beastly"?' asked Buxton, glancing at the lad.

'Well, sir, you'll think me no end of an ass, but I'd like to tell you something I've never told a soul till now.'

'Go ahead,' said the colonel kindly.

'It's . . . some more about this Siwalik business. I'm never nervy, and I'm A1. healthy, but from the first moment I got into those hills, I felt pretty much what Mrs Leyton feels. I go there just the same—I won't be scared off—but I don't like it. I've sat up for tiger there, three times. The first time was with Jenkins of the Piffers, and a thunderstorm came on—it was in the Christmas rains. We both saw . . . something rummy, like . . . well, like very big apes, by the flashes of lightning. Jenks fired both barrels at them—it was as real as that. Poor old Jenks was killed in the last Afghan show, you know.'

'Yes,' said Buxton absently; and added, 'Better not tell any one that yarn. It might get round to Mrs Leyton.'

'Rather not, sir. As I say, I haven't let on to a soul but you, and it happened over three years ago. After a bit I began to believe it was a what-d'you-call-it—hallucination—nerves dicky; though if it was that, it's my one-and-only. And I knew if I told the yarn I'd be ragged out of my life. But it's not only what Jenks and I saw—and the story about the boy. There've been other rummy things.'

'What sort of things?'

'Oh, accidents on the Mohand road that have never been properly accounted for; horses bolting, and so on. But of course that might have been leopards. . . . I've wanted badly to get that yarn of my own off my chest, and somehow, after that talk at tea, I thought you might throw some light on it—X-ray light, sir!' He laughed.

'Well, I can't, Leonard. There are queer enough things on this earth, let alone other regions—and perhaps queerest of all in this India of ours. Better stick to the hallucination theory. See you again later—I'm going to play Bridge.'

'Right, sir—and thanks awfully for not rotting me!' said the boy, with a quick smile.

'Nothing to rot about,' smiled back the colonel; 'even "hallucinations" aren't matter for rotting, you know—except for fools!'

CHAPTER II.

I.

THE Leytons had started for the Mohand Forest bungalow in clear weather, about four in the afternoon. For the last few days there had been heavy thunderstorms, but what promised to be a break in the rains had followed, and Arminel, tired of being cooped in the house, was eager for a change. They had planned to go to Luchiwalla, but had been told that a tree was down across the road, and Leyton had said, 'Let's go to Mohand—it's farther, and the roads are pretty bad now, but it's some view, looking over the plains from the bungalow.'

A couple of miles beyond the Mohand tunnel a terrific thunderstorm burst in the Siwaliks. In a few minutes the car was ploughing through running water, the deluge of rain streaming off the hood, and blowing in on the weather-side. Ear-splitting detonations seemed actually to shake the hills, the reverberations hurled across, bounding and rebounding, like the explosion of

twelve-inch guns in a pent area, and wicked lightning stabbed from the inky sky.

Down the river-like road the car splashed cautiously, for some of the turns were of the hairpin order, and at last drew up on the level, at the steep bank on which the bungalow was perched. Damp but undaunted, Arminel and Leyton climbed up by a short-cut, Joseph and the caretaker carrying the tea-basket.

Tea was a merry meal, the facetious entries in the bungalow visitors' book contributing to its mirth. Before tea was over the storm circled back, and Leyton was for starting in spite of it, but Arminel pleaded to wait until the worst had passed; she wanted to see the panorama of the great plains. They did wait, and she saw the famous view, for the plains were clear; and at about half-past six they started for home.

The storm had worked up the Ganges, and was now travelling along the Himalayas. Distant thunder rumbled at intervals, and lightning throbbed in the northern sky. The car was taking the stiff gradients gallantly, and Leyton was saying that so far he had only twice used second speed, when a pistol-like explosion announced a burst front tire. The Stepney was fixed in ten minutes, and they had gone on for about half a mile, when bang went a back tire, and Leyton used a strong word regarding the state of the roads.

(Continued on page 163.)

THE NEW BALTIC STATES.

IV.—THE FREE CITY OF DANZIG.

By ROBERT MACHRAY.

I.

DANZIG has many claims on our interest. There is, of course, the political question which is associated with it, and is the main subject of this article. Under the style and title of a free city, Danzig, with the territory immediately surrounding it, now takes its place as a sovereign state in the list of the new Baltic States by the side of Esthonia, Latvia, and Lithuania, states of which I have already written at some length in this magazine.¹

But Danzig has other and, in a more broadly human sense, higher claims. It is a city of singular charm, of a magic all its own. From the first it casts a spell over every one who visits it, and the spell, instead of dying away with repetition, grows stronger with each visit. Casts a spell is exactly the right expression for what Danzig does. Probably no other of the world's cities, great or small, at any rate in Europe, has quite the same effect. Parts of

other cities are places of like enchantment, such as the Tower of London and Holyrood in Edinburgh, to mention two familiar instances. In the case of Danzig, however, it is all Danzig that bewitches and delights. Why is this?

Well, the secret of its fascination is an open one; anybody with eyes, illumined ever so slightly by the spirit, can read it for himself. It is that while Danzig is a 'business town,' pure and simple, existing in fact as nothing else and dependent for its existence on its being nothing else, it is a city whose streets and buildings, with their interiors, its canals and quays, not only suggest but preserve the veritable air, the poetry and romance, the 'velvet and bright iron,' to quote Stevenson's flashing phrase, of the Middle Ages. Even its newest houses have been built on the lines beloved by its old architects, and blend harmoniously with the most ancient. The counting-house of the Danzig merchant of to-day has everything of the most modern in its appliances and methods, but the counting-house itself belongs to the fifteenth or sixteenth century. It is this very unusual

¹ See March 1921 issue for Esthonia, May 1921 for Latvia, and October 1923 for Lithuania.

combination everywhere of contrasts—the up-to-date and the medieval—which at once makes and emphasises Danzig's extraordinary appeal.

It is not as if Danzig were a small place; it is no mean city. With nearly 200,000 inhabitants it covers an extensive area of land and water—in its rivers and canals it has so large and so picturesque a feature that it disputes with Stockholm the right to be called the Venice of the North. It is a very considerable commercial centre. For centuries the chief port of the lower Eastern Baltic, it has had a trade which no doubt has fluctuated a good deal with the changing years, but has always been notable for its volume and value. Nor could it well be otherwise. Situated at the mouth, or rather on one of the mouths, of the Vistula, it has as its hinterland the whole vast basin of that magnificent waterway, which is 700 miles in length—a tributary region that includes something like 125,000 square miles of territory, and is larger than that of the Rhine or the Elbe. Of this immense tract Danzig is virtually the sole outlet to the sea, and this tract is Polish—is, in brief, Poland, a fact which is merely noted here, as its political implications will be considered farther on in this article. Grain and timber are Danzig's principal exports, as might be expected from the general character of the hinterland—a well-watered plain of fields and forests. These exports have varied in quantity and quality as conditions have varied.

For some years past, as everybody knows, conditions all over the world have not been favourable, and Danzig, like other cities and ports whose life is trade, has suffered. Yet its prosperity is growing again. During the year 1922–23 a distinct advance was recorded, as compared with the years following the Armistice; upwards of 3000 vessels entered its harbour, their total tonnage being well above one and a half millions. Indeed, strong tides of commerce flow and ebb in Danzig almost as if it were a bustling, hustling Western town, but all that side of it can easily be forgotten when one walks its storied thoroughfares and breathes its romantic atmosphere. Without an effort one steps back three, four, five hundred years, and not just here or there, as in most cities with a past, but at all points. As Baedeker, in his *Northern Germany*, issued shortly before the Great War, somewhat primly phrased it, 'The appearance of the streets, with their narrow, lofty, and richly-decorated gable-facades, is still very antiquated.' Quite true, as a way of putting it. Thank heaven, Danzig remains 'very antiquated,' and is likely to continue long to present that 'appearance,' to the joy of all beholders.

II.

Although often nowadays termed the Danger Spot of Europe, and in a great measure rightly

so termed, Danzig is a place of peace. It has lost its old-time warlike character; for centuries it was always fighting at home or abroad; time was when it was no better, in fact, than a nest of pirates—to be fair, let us remember Bristol and Plymouth.

In the chapel of St Dorothea, in the Marienkirche, which is the dom or cathedral of Danzig, there is to be seen as curious a survival of the period of the freebooters as can be found anywhere on earth. It takes the shape of Memling's famous painting, 'The Last Judgment.' This painting is Danzig's greatest treasure, but how did the city acquire it? By piracy on the high seas. The picture is a large altar-piece with wings; on the outside of the wings are portraits of Angelo Tani, a Florentine, for whom the picture was painted at Bruges, and his wife, their intention being to present the piece to a church in Florence. According to the story, the painting was shipped for Italy from Bruges by way of England, but the vessel, which was laden with much other treasure, was captured by the Danziger pirate, Paul Beneke, commanding the *Peter*, and taken in to Danzig, where it passed into the possession of the ecclesiastical authorities, who no doubt discovered plenty of good reasons for keeping it. All this happened towards the end of the fifteenth century. In 1807 the French carried the painting off to Paris, but it was restored to Danzig after the close of the Napoleonic wars.

Mention of the French in this connection may remind some of my readers that much of Henry Seton Merriman's fine romance, *Barlasch of the Guard*, is staged in Danzig, as it existed during its occupation by Napoleon's troops. The house in the Frauengasse, the quaintest of all the city's quaint streets, in which Barlasch was supposed to live, is pointed out to visitors—in this way Danzig, it may be, has made Merriman immortal. In those days Danzig was a walled town, with several great gates, locally known as Tors; coming down to our own time, it was a fortress city and the headquarters of a German Army Corps, with the Crown Prince at its head. The great Tors still stand, but the walls have disappeared, and Danzig is no longer a fortress, nor do its streets echo the march of armed men. Peace broods over the city, whose pursuits are certainly those of peace, and whose interests, therefore, demand peace above everything else. But is this peace real?

Here we come up against the political question, and the first thing to do by way of clearing the ground, if haply the ground can be cleared, is to consider the history of Danzig, which, fortunately for brevity, falls into well-marked periods. Though of immemorial importance from its situation in the delta of the Vistula, Danzig's recorded history dates from about a thousand years ago, when it was quite definitely and admittedly a Slav settlement—that is, it was

inhabited by some tribe or tribes belonging to that part of the Slav race later identified as Polish. From that date up to 1814 Danzig, through all changes of fortune, was always conscious, sometimes more and sometimes less so, of its Polish origin, connections, and affinities. In the long and bitter struggle between the Slav and the Teuton on the shores of the Baltic, Danzig played a considerable part. In the old Slav days it was called Gdansk, which is the name the Poles still give it. Early in the fourteenth century, after much fighting, in the course of which Danzig had various alien as well as home-grown masters, it passed under Germanic rule, which continued for about a hundred and fifty years, and the city began to be known as Danzig or Dantsic, evidently corruptions of its Slav appellation.

Next comes the Hanseatic period, when Danzig, having shaken off the tyranny of the Teutonic Knights, figures as a Free City, but under the aegis of Poland, on whose second partition, in 1793, it became Prussian. A little later it fell under the sway of Napoleon, but in 1814 it was ceded to Prussia. There can be small doubt that up to that date Danzig was far more Polish than anything else, certainly far more Polish than German. Those interested in this subject will find it very fully discussed in M. Simon Askenazy's book, *Danzig and Poland*, an English version of which was published in London in 1921. Naturally some discount must be made for Polish bias in this volume, but its conclusions may be taken as in the main correct. For more than a century after 1814 Danzig underwent Prussification in its most intensive form. It ranked as the capital of the province of West Prussia, and if part of its natural trade was diverted by German policy to Königsberg on the east and Stettin on the west, it found some compensation in a vastly enlarged ship-building industry, of which the Schichau dock-yard was the most important factor. And German Danzig remained till 1919, when it was made a Free City under the League of Nations.

III.

Is Danzig Polish or German? As its history shows, it has been both. During the Prussification period, 1814-1914, German colonists displaced many Danzigers, and at the time of the Armistice the city was probably more German than it had ever been before, for as the Great War went on, it developed into a centre of munition industries, which were staffed and manned by thousands imported from elsewhere in the German Empire. Up till 1814 the population of Danzig must have been a good deal mixed. Besides Polish and German elements there was an English strain, typified by the beautiful English House, a sixteenth-century building in the Brodbänkengasse; and

there was a much stronger Scottish strain, which gave (and still gives) the names of Old Scotland and New Scotland to two of the city's suburbs. English or Scottish descent can be traced plainly enough in the names of some of Danzig's inhabitants. But to-day one has to be in the town for only a few minutes to be sure that to most intents and purposes the city is German. It speaks German and transacts its business in German. The vast majority of the shops display German names and signs above them. Not one person in twenty talks Polish. At the elections to the Volkstag or Parliament of the Free City held in November, 1923, the Poles were able to poll only 4600 votes out of a total of 165,000 cast, and to secure but 5 seats out of a total of 120.

To be just, I am bound to add that among representative Danzigers I found a dislike of and a certain contempt for the Poles—which may or may not be well-grounded, but seemed to me to be built very largely on the assumption that Poland is an unstable quantity politically, and may even perish as it did before. However that may be, it is quite impossible to ignore the numerous landmarks the Poles have left in Danzig of their former rule and intimate contact with the whole life of the city. For example, the White Eagle of Poland spreads its wings in the Council Chamber of the Rathaus or Town Hall, which has a graceful spire, on whose summit stands a statue of the Polish king, Sigismund Augustus; while on the lower part of the façade of the Artushof, near by, are medallion portraits of Sigismund III. and his son Ladislaus IV. The works of Polish artists, notably of Stryowski, himself a Danziger, hang in the galleries and decorate the public buildings. There is a significance in the fact that these Polish landmarks are taken good care of, as it demonstrates that Danzig in the past had no reason to complain of Polish sovereignty. It undoubtedly is the case that the city attained its golden age when Poland was its suzerain. What fate is in store for Danzig now?

Articles 100 to 108 of the Treaty of Versailles provide that Danzig, with the adjoining territory, shall be a Free City, controlled by a High Commissioner appointed by the League of Nations, and shall have a Constitution guaranteed by the League. The area of the Free City is 745 square miles, and its population about 365,000. Besides Danzig, Zoppot, a gay and fashionable watering place, with some 18,000 residents, is the only town of importance, but there are two or three little towns. The Free City has a seafront of 35 miles, on which there are no fewer than nine or ten bathing resorts—which, in its way, is surely a record! One or two tiny islands are being thrown up in Danzig Bay by the silt from the Vistula, and the Free City has promptly determined to annex them. In 1920 Danzig was proclaimed a Free City, and

a Constitution was drawn up, and approved and guaranteed by the League of Nations.

The charter of Danzig contains, however, certain reservations in favour of Poland, of which, perhaps, the most striking is, that the foreign relations of the Free City are to be conducted by Poland. Danzig is included within the Polish Customs frontiers. Poland is guaranteed the free use of and right to develop and improve all waterways, docks, basins, wharves and other works within the Free City, as well as given specific rights on the Vistula, and over the whole railway system of Danzig. Above all, the Free City is bound by the Treaty to show no unfavourable discrimination with respect to the Poles. Two treaties, or rather conventions, embodying the foregoing points have been negotiated between Danzig and Poland, but there has been considerable friction nevertheless. The Free City has a parliament, consisting of a popular chamber of a hundred and twenty members, and a senate of twenty-two members, of whom one is the President and another is the Vice-President, the former directing the routine of the administration. But the real power is exercised by the High Commissioner, appointed by the League of Nations. He acts as referee or arbiter, and decides disputed matters as between the Danzigers and the Poles; he has had the support of the League in his efforts to hold the scales even, and the feeling is general that he has been strictly impartial. It is worthy of note that all the High Commissioners so far have been British. The port of Danzig is administered by a Harbour Control Commission of five Danzigers and five Poles, with a neutral as chairman—at present a Swiss engineer fills the post.

IV.

Although the arrangements which have been come to since 1920 by the parties concerned work more or less smoothly, they satisfy neither the Danzigers nor the Poles. If the Free City were genuinely independent and absolutely Danziger—neither German nor Polish—a good defence could be offered of the present régime. The trouble is that Danzig, call it sovereign state, Free City, or what you like, remains in its outlook nothing more or less than an outpost of Germany. Its local government is frankly of the Junker type, which is so strong in the neighbouring East Prussia, and the parties in its Volkstag are much the same as those of the Reichstag. Its President is a former German official, and is more than suspected of being in closest touch with Berlin or even with Ludendorff and the Extremists. It would be different if it were under Poland, but as things are Danzig looks to Germany. And it does this despite the great governing fact of the economic situation, though it is by that it will finally stand

or fall. As I have already said, the hinterland of Danzig is Poland, and there is no other. If the Poles will not trade with or through the port Danzig will shrink into a small, moribund place.

Except on the sea the Free City is almost entirely surrounded by Polish territory—the 'Corridor,' the tract of land lying between Germany and East Prussia, which was given back to Poland by the Versailles Treaty. I say given back, for before the partitions this Corridor was in existence, its sole port being Danzig. Under the treaty the Corridor reaches the Baltic, but does not contain a port, for Danzig has been excluded from it. So dissatisfied are the Poles that they have actually begun the construction of an entirely new port at Gdynia, just outside the frontier of the Free City on the north-west. The threat to Danzig is obvious, and needs no elaboration. The new port, which will have to be dug out of the solid ground, just as Libau, Tsarist Russia's naval base in the Baltic, was dug out, will cost many millions, but very strong French iron and steel interests are already engaged in the undertaking. A Polish friend tells me that the intention regarding Gdynia is to complete, not to compete with, Danzig, but I question whether the Danzigers will regard it quite in that way, though they appear at the moment to make light of it.

A few miles higher up the Baltic lies the port of Memel, which presents a certain analogy to Danzig. In the dim past Memel was Lithuanian, but at the time of the Armistice, as for many years previously, it was as German or Germanised a place as Danzig. Immediately around it was a small block of territory, which may conveniently be called Memelland, that in the main retained its Lithuanian character. Naturally that was taken into account, but was not the chief reason why Lithuania was recently given sovereignty over Memel—it was the fact, as stated by the Allied and Associated Powers to the German Delegation at Versailles on 16th June 1919, 'the port of Memel is the only sea outlet for Lithuania.' Memelland, including Memel, has been given autonomy under the Government of Lithuania; it is not a sovereign state. Now, Memel is not only Lithuania's sole outlet to the sea, but it has no hinterland apart from Lithuania.

How similar is the position with regard to Danzig and Poland. Parity of reasoning infallibly suggests a similar political accommodation respecting them. Had Danzig been united to Poland, as Memel to Lithuania, its economic interests, which, as already indicated, are Polish, would have worked in a perfectly natural way for closer and closer union, as, I think, will be the case with Memel and Lithuania. But orienting itself to Germany, Danzig pulls away from Poland, in defiance of its plain economic interests. It is an unfortunate situation, and contains a real menace to peace. Danzig thus continues

to be the Danger Spot of Europe. There is another point on which I merely touch. As a sovereign state Danzig maintains a host of officials, which would not be necessary were it under Poland; consequently, taxation is very heavy and the cost of living proportionately high.

My personal hope is that the Free City, following the example of her prototype in the Middle Ages, will one day voluntarily place herself under the sovereignty of Poland, and for much the same compelling cause—her vital interests. What has she to expect from Germany?

JOHN MACNAB: A COMEDY FOR POACHERS.

By JOHN BUCHAN, Author of *John Burnet of Barns*, *Greenmantle*, &c.

CHAPTER V.—continued.

NIGHT fell, cool and cloudless, and the gillies went on their patrols. Carnmore was their only beat, and they returned one at a time to snatch a few hours' sleep. At dawn they went out again—with the colonel, but without Alan, who was to follow after he had had his ration of sleep. It was arranged that the two girls and Junius Bandicott should spend the day on Carnbeg by way of extra precautions, though if a desperate man made the assault there, it was not likely that Junius, who knew nothing of deer, and had no hillcraft, would be able to stop him.

Janet woke in low spirits, and her depression increased as the morning advanced. She was full of vague forebodings, and of an irritable unrest to which her steady nerves had hitherto been a stranger. She wished she were a man and could be now on Carnmore, for Carnbeg she was convinced was out of danger. Junius, splendid in buckskin breeches and a russet sweater, she regarded with disfavour; he was a striking figure, but out of keeping with the hills, the obvious amateur, and she longed for the halting and guileful Sir Archie. Nor was her temper improved by the conduct of her companions. Agatha and Junius seemed to have an inordinate amount to say to each other, and their conversation was idiotic to the ears of a third party. Their eyes were far more on each other than on the landscape, and their telescopes were never in use. But it mattered little, for Carnbeg slept in a primordial peace. Only pipits broke the silence; only a circling merlin made movement in a spell-bound world. There were some hinds on the west side of Craig Dhu, but no stag showed—as was natural, the girl reflected, for in this weather, and thus early in the season, the stags would be on the high tops of Carnmore. John Macnab had chosen rightly if he wanted a shot, but there were three gillies and her father to prevent him from getting his beast away.

At luncheon, which was eaten by the Cail-leach's Well, Junius took to quoting poetry, and Agatha to telling, very charmingly, the fairy-tales of the glens. To Janet it all seemed wrong; this was not an occasion for literary

philandering, when the credit of Glenraden was at stake. But even she was forced to confess that nothing was astir in the mossy wilderness. She climbed to the top of Craig Dhu, and had a long spy, but, except for more hinds and one small knobber, living thing there was none. As the afternoon drew on, she drifted away from the two, and they, being engrossed with each other, did not notice her departure.

She wandered through the deep heather of the Maam to where the great woods began that dipped to the Raden glen. It was pleasant walking in the cool shade of the pines on turf which was half thyme and milkwort and eye-bright, and presently her spirits rose. Now and then on some knuckle of heath-covered rock which rose above the trees she would halt, and, stretched at full length, would spy the nooks of the Home beat. There was no lack of deer there. She picked up one group and then another in the aisles and clearings of the woods, and there were shootable stags among them.

A report like a rifle shot suddenly startled her. Then she remembered old Mr Bandicott down in the haugh, and, turning her glance in that direction, saw a thin cloud of blue smoke floating away from the Piper's Ring.

Slowly she worked her way downhill, aiming at the haugh about a mile upstream from the excavators. Once a startled hind and calf sprang up from her feet, and once an old fox slipped out of a pile of rocks and revived thoughts of Warwickshire and her problematical hunter. Soon she was not more than three hundred feet above the stream level, and found a bracken-clad hillock where she could lie and watch the scene. There was a roebuck feeding just below her, a roebuck with fine horns, and it amused her to see the beast come nearer and nearer, since the wind was behind him. He got within five yards of the girl, who lay mute as a stone; then some impulse made him look up and meet her eye, and in a second he had streaked into cover.

Amid that delicious weather and in that home of peace Janet began to recapture her usual mirthfulness. She had been right; Carnmore was the place John Macnab would select, unless

his heart had failed him, and on Carnmore he would get a warm reception. There was no need to worry any longer about John Macnab. Her thoughts went back to Agatha. Clearly Junius Bandicott was in love with her, and probably she would soon be in love with Junius Bandicott. No one could call it anything but a most suitable match, but Janet was vaguely unhappy about it, for it meant a break in their tiny household and the end of a long and affectionate, if occasionally tempestuous, comradeship. She would be very lonely at Glenraden without Agatha, and what would Agatha do when transplanted to a foreign shore, Agatha for whom the world was bounded by her native hills? She began to figure to herself what America was like, and as her pictures had no basis of knowledge they soon became fantastic, and merged into dreams. The drowsy afternoon world laid its spell upon the girl and she fell asleep.

She woke half-an-hour later with the sound of a shot in her ear. It set her scrambling to her feet till she remembered the excavators at the Piper's Ring, who were out of the sight of the knoll on which she stood, somewhat on her right rear. Reassured, she lazily scanned the sleeping haugh, with the glittering Raden in the middle distance, and beyond, the wooded slopes of the other side of the glen. She noticed a small troop of deer splashing through the shallows. Had they been scared by Mr Bandicott's explosion? That was odd, for the report had been faint and they were up wind from it.

They were badly startled, since they raced through the river and disappeared in the farther woods. . . . Suddenly a thought made her heart beat wildly, and she raked the ground with her glass.

There was something tawny on a patch of turf in a little hollow near the stream. A moment of anxious spying showed her that it was a dead stag. The report had not come from Mr Bandicott's dynamite, but from a rifle.

Down the hillside like a startled hind went Janet. She was choking with excitement, and had no clear idea in her head except a determination that John Macnab should not lay hand on the stricken beast. If he had pierced their defences, and got his shot, he would at any rate not get the carcass off the ground. No thought of the stakes and her hunter occurred to her—only of Glenraden and its inviolate honour.

Almost at once she lost sight of the place where the stag lay. She was now on the low ground of the haugh, in a wilderness of bogs and hollows and overgrown boulders, with half a mile of rough country between her and her goal. Soon she was panting hard. Presently she had a stitch in her side, her eyes dimmed with fatigue, and her hat flew off and was left behind. It was abominable ground for speed, for there were heather-roots to trip the foot, and mires to

engulf it, and noxious stones over which a runner must go warily or break an ankle. On with bursting heart went Janet, slipping, floundering, more than once taking wild tosses. Her light shoes grew leaden, her thin skirts a vast entangling quilt; her side ached and her legs were fast numbing. . . . Then, from a slight rise, she had a glimpse of the Raden water now very near, and the sight of a moving head. Her speed redoubled, and miraculously her aches ceased—the fire of battle filled her, as it had burned in her progenitors when they descended on their foes through the moonlit passes.

Suddenly she was at the scene of the dark deed. There lay the dead stag, and beside it a tall man with his shirt-sleeves turned up and a knife in his hand. That the miscreant should be calmly proceeding to the gralloch was like a fiery stimulant to Janet's spirit. Gone was every vestige of fatigue, and she descended the last slope like a mænad.

'Stop!' she sobbed. 'Stop, you villain!'

The man started at her voice, and drew himself up. He saw a small dishevelled girl, hatless, her fair locks fast coming down, who, in the attitude of a tragedy queen, stood with uplifted and accusing hand. She saw a tall man, apparently young, with a very ruddy face, a thatch of sandy hair, and ancient disreputable clothes.

'You are beaten, John Macnab,' cried the panting voice. 'I forbid you to touch that stag. I—'

The man seemed to have grasped the situation, for he shut the knife and slipped it back in his pocket. Also he smiled. Also he held both hands above his head. '*Kamerad!*' he said. 'I acknowledge defeat, Miss Raden.'

Then he picked up his rifle and his discarded jacket, and turned and ran for it. She heard him splashing through the river, and in three minutes he was swallowed up in the farther woods.

The victorious Janet sank gasping on the turf. She wanted to cry, but changed her mind and began to laugh hysterically. After that she wanted to sing. She, and she alone, had defeated the marauder, while every man about the place was roosting idly on Carnmore. Now, at last, she remembered that hunter who would carry her in the winter over the soft Warwickshire pastures. That was good, but to have beaten John Macnab was better. . . . And then just a shade of compunction tempered her triumph. She had greatly liked the look of John Macnab. He was a gentleman—his voice bore witness to the fact, and the way he had behaved. *Kamerad!* He must have fought in the War, and had no doubt done well there. Also, he was beyond doubt a sportsman. The stag was just the kind of beast that a sportsman would kill—a switch-horn, going back in condition—and he had picked

him out of a herd of better beasts. The shot was a workmanlike one—through the neck. . . . And the audacity of him! His wits had beaten them all, for he had chosen the Home beat, which every one had dismissed as inviolable. Truly a foeman worthy of her steel, whom like all good fighters after victory she was disposed to love.

Crouched beside the dead stag, she slowly recovered her breath. What was the next move to be? If she left the beast might not John Macnab return and make off with it? No, he wouldn't. He was a gentleman and would not go back on his admission of defeat. But she was anxious to drain the last drops of her cup of triumph, to confront the idle garrison of Carnmore on its return with the tangible proof of her victory. The stag should be lying at the Castle door, and she herself waiting beside it to tell her tale. She might borrow Mr Bandicott's men to move it.

Hastily doing up her hair, she climbed out of the hollow to the little ridge which gave a prospect over the haugh. There before her, not a hundred yards distant, were the old cart and the white pony of Fish Benjie, looking as if they had been part of the landscape since the beginning of time.

Benjie had wormed his way far into the moss, and was more than half a mile from the road. It appeared that he had finished his day's work on the besoms, for his pony was in the shafts, and he himself was busy loading the cart with the fruits of his toil. She called out to him, but got no reply, and it was not till she stood beside him that he looked up from his work.

'Benjie,' she said, 'come at once. I want you to help me. Have you been here long?'

'Since nine this mornin', lady.' Benjie's face was as impassive as a stump of oak.

'Didn't you hear a shot?'

'I heard a gude wheen shots. The auld man up at the Piper's Ring has been blazin' awa'.'

'But close to you? Didn't you see a man—not five minutes ago?'

'Ay. I seen a man. I seen him crossin' the water. I thought he was a gentleman from the Castle. He had a gun wi' him.'

'It was a poacher, Benjie,' said Janet dramatically. 'The poacher I wanted you to look out for. He has killed a stag, too, but I drove him away. You must help me to get the beast home. Can you get your cart over that knowe?'

'Fine, lady.'

Without more words Benjie took the reins and started the old pony. The cart floundered a little in a wet patch, tittuped over the tussocks, and descended with many jolts to the neighbourhood of the stag—Janet dancing in front of it like an Israelitish priest before the Ark of the Covenant.

The late afternoon was very hot, for down in the haugh the wind had died away. The stag

weighed not less than fifteen stone, and before they finished Janet would have called them tons. Yet the great task of transhipment was accomplished. The pony was taken out of the shafts, and the cart tilted, and after some strenuous minutes the carcass was heaved and pushed and levered on to its floor. Janet, hanging on to the shafts, with incredible exertions pulled them down, while Benjie—a tiny Atlas—prevented the beast slipping back by bearing its weight on his shoulders. The back-board was put in its place, the mass of brooms and heather piled on the stag, the pony restored to the shafts, and the cortege was ready for the road. Benjie had his face adorned with a new scratch and a quantity of deer's blood, Janet had nobly torn her jumper and one stocking, but these were trivial casualties for so great an action.

'Drive straight to the Castle, and tell them to leave the beast before the door. You understand, Benjie? Before the door—not in the larder. I'm going to cut home through the woods, for I'm an awful sight.'

'Ye look very bonny, lady,' said the gallant Benjie as he took up the reins.

Janet watched the strange outfit lumber from the hollow and nearly upset over a hidden boulder. It had the appearance of a moving peat-stack, with a solitary horn jutting heavenwards like a withered branch. Once again the girl subsided on the heather and laughed till she ached.

The highway by the Larrig side slept in the golden afternoon. Not a conveyance had disturbed its peace save the baker's cart from Inverlarrig, which had passed about three o'clock. About half-past five a man crossed it, a man who had descended from the hill, and who had used the stepping-stones where Sir Archibald Roy-lance had come to grief. He was a tall man with a rifle, hatless, untidy, and very warm, and he seemed to desire to be unobserved, for he made certain that the road was clear before he ventured on it. Once across, he found shelter in a clump of broom, whence he could command a long stretch of the highway, almost from Glenraden gates to the bridge of Larrig.

Mr Palliser-Yeates, having reached sanctuary—for behind him now lay the broken hill-sides of Crask—mopped his brow and lit a pipe. He did not seem to be greatly distressed at the result of the afternoon. Indeed he laughed—not wildly like Janet, but quietly, and with philosophy. 'A very neat hold-up,' he reflected. 'Gad, she came on like a small destroying-angel. . . . That's the girl Archie's been talking about. . . . A very good girl. She looked as if she'd have taken on an army corps. . . . I suppose that was the right way for the thing to end. . . . Jolly romantic ending—might have come out of a novel. Only it should have been Archie, and a prospect of wedding bells—

what? . . . Anyhow we'd have won out all right but for the girl, and I don't mind being beaten by her——'

His meditations were interrupted by the sound of furious wheels on the lone highway, and he cautiously raised his head to see an old horse and an older cart being urged towards him at a canter. The charioteer was a small boy, and above the cart sides projected a stag's horn.

Forgetting all precautions, he stood up, and at the sight of him Benjie, not without difficulty, checked the ardour of his much-belaboured beast, and stopped before him.

'I've gotten it,' Benjie whispered hoarsely; 'the stag's in the cairt. The lassie and me histed him in, and she tell't me to drive to the Castle; but when I was out o' sight o' her, I took the auld road through the wud, and here I am. We've gotten the stag off Glenraden ground, and we can hide him up at Crask, and I'll slip down i' the cairt afore mornin' and leave him ootby the Castle wi' a letter from John Macnab. Fegs, it was a near thing.'

Benjie's voice rose into a shrill pean, his disreputable face shining with unholy joy. And then something in Palliser-Yeates's eyes cut short his triumph.

'Benjie, you little fool, right about turn at once. I'm much obliged to you, but it can't be done. It isn't the game, you know. I chucked up the sponge when Miss Raden challenged me, and I can't go back on that. Off you go to Glenraden and hand over the stag. Quick,

before you're missed . . . And look here—you're a first-class fellow, and I'm enormously grateful to you. Here is something for your trouble.'

Benjie's face grew very red as he swung his equipage round. 'I see,' he said. 'If ye like to be beat by a lassie, dinna blame me. I'm no' wantin' your money.'

The next moment the fish-cart was clattering in the other direction.

To a mystified and anxious girl, pacing the gravel in front of the Castle, entered the fish-cart. The old horse seemed in the last stages of exhaustion, and the boy who drove it was a dejected and sparrow-like figure.

'Where in the world have you been?' Janet demanded.

'I was run awa' wi', lady,' Benjie whined. 'The auld powny didna like the smell o' the stag. He bolted in the wud, and I didna get him stoppit till verra near the Larrig brig.'

'Poor little Benjie! Now you're going to Mrs Fraser to have the best tea you ever had in your life, and you shall also have ten shillings.'

'Thank you kindly, lady, but I canna stop for tea. I maun awa' down to Inverlarrig for my fish.' But his hand closed readily on the note, for he had no compunction in taking money from one who had made him to bear the bitterness of incomprehensible defeat.

(Continued on page 173.)

THE LOST ATLANTIS.

FRESH LIGHT ON THE PROBLEM.

By LEWIS SPENCE, Author of *The Problem of Atlantis*.

I.

RECENT volcanic disturbances in the bed of the Atlantic Ocean have caused submarine upheavals so widespread and so profound that the more conservative school of geologists, who once airily dismissed the arguments of those who believed in the destruction of the lost Atlantis by similar agencies, may now be hard put to it to maintain their attitude of indifference. In August 1923 a vessel belonging to the Western Union Telegraph Company was searching for a lost cable which had been laid twenty-five years before, and the responsible officers found to their amazement, on taking soundings at the exact spot where it had been laid down, that the surface of the ocean-bed there had risen during that time by nearly two and a quarter miles.

The bed of the Atlantic is, indeed, the most unstable portion of the earth's surface. Its eastern region, says M. Pierre Termier, Director

of Science of the Geological Chart of France, is a great volcanic zone. In its European-African depression sea-volcanoes and insular volcanoes are abundant. Its islands are largely formed of lava. The same formation occurs in its American or western region. The bed of the Atlantic, says M. Termier, is still in movement in the extreme eastern zone for a space of about 1875 miles in breadth, which embraces Iceland, the Azores, the Canaries, Madeira and the Cape Verde Islands. In any part of this area unrecorded submarine cataclysms may be taking place at any time.

M. Termier is only one of a growing band of geologists who devoutly believe that a great Atlantean continent formerly existed. With the gradual collection of new evidence relative to the geology and the biology of the Atlantic region the theory concerning the existence of such a land-mass has taken on an entirely new complexion. The evidence in question does not depend upon the misty surmises of visionaries

or the dogmatic assertions of that type of antiquary who twists tradition and philology into the semblance of testimony, but on considerations the most rational and credible. That an Atlantean continent once occupied the present oceanic gulf between Europe and America is a scientific truth now accepted by geologists of all shades of opinion, and the only question of debate which still remains has reference to the precise period in geological history at which this continent flourished.

M. Termier believes that 'a North Atlantic continent comprising Russia, Scandinavia, Great Britain, Greenland, and Canada, to which was added later a southern band made up of a large part of Central and Western Europe and an immense portion of the United States,' formerly existed. 'There was also,' he says, 'a South Atlantic, or African-Brazilian, continent, extending northward to the southern border of the Atlas, eastward to the Persian Gulf and Mozambique Channel, westward to the eastern border of the Andes and to the sierras of Colombia and Venezuela. Between the two continents passed the Mediterranean depression, that ancient maritime furrow which has formed an escarp about the earth since the beginning of geologic time, and which we see so deeply marked in the present Mediterranean, the Caribbean Sea, and the Sunda or Flores Sea. A chain of mountains broader than the chain of the Alps, and perhaps in some parts as high as the majestic Himalayas, once lifted itself on the land-enclosed shore of the North Atlantic continent, embracing the Vosges, the Central Plateau of France, Brittany, the south of England and of Ireland, and also Newfoundland, Nova Scotia, and, in the United States, all the Appalachian region.'

The end of this continental era, thinks M. Termier, came during the Tertiary Period, when the mass, bounded on the south by a chain of mountains, was submerged long before the collapse of those volcanic lands of which the Azores are the last vestiges. The South Atlantic ocean was likewise occupied for many thousands of centuries by a great continent now engulfed beneath the sea. These movements of depression probably occurred at several periods. In the Europe of the Tertiary era the movement was developing which gave rise to the Alpine mountain chain. How far did this chain extend into the Atlantic region? Did some fragments of it rise high enough to lift themselves for some centuries above the waters? This question M. Termier answers in the affirmative.

He believes that the geology of the whole Atlantic region has singularly changed in the course of the later periods of the earth's history. During the Secondary Period there were numerous depressions, the Tertiary Period saw the annihilation of the continental areas, and subsequently there appeared a new design,

the general direction of which was north and south. Near the African continent, he holds, there have certainly been important movements during Quaternary times, when other changes undoubtedly took place in the true oceanic region. 'Geologically speaking,' he says, 'Plato's theory of Atlantis is highly probable. . . . It is entirely reasonable to believe that long after the opening of the Strait of Gibraltar certain of these emerged lands still existed, and among them a marvellous island, separated from the African continent by a chain of other smaller islands. One thing alone remains to be proved—that the cataclysm which caused this island to disappear was subsequent to the appearance of man in Western Europe. The cataclysm is undoubted. Did men then live who could withstand the reaction and transmit the memory of it? That is the whole question. I do not believe it at all insoluble, though it seems to me that neither geology nor zoology will solve it. These two sciences appear to have told all they can tell, and it is from anthropology, from ethnography, and, lastly, from oceanography that I am now awaiting the final answer.'

II.

Professor R. F. Scharff of Dublin, who has perhaps contributed more valuable data to the literature of Atlantean research than any other living scientist, concludes that Madeira and the Azores were connected with Portugal in Miocene times, when man had already appeared in Europe, and that from Morocco to the Canary Islands and thence to South America stretched a vast land which extended southward as far as St Helena. This great continent, he believes, began to subside before the Miocene or late Tertiary Period. But he holds that its northern portions persisted until the Azores and Madeira became isolated from Europe. 'I believe,' he says, 'that they were still connected in early Pleistocene (Ice Age) times with the continents of Europe and Africa, at a time when man had already made his appearance in Western Europe, and was able to reach the islands by land.'

Among those modern geologists who uphold the Atlantean theory is Professor Edward Hull, whose investigations have led him to conclude that the Azores are the peaks of a submerged continent which flourished in the Pleistocene period. 'The flora and fauna of the two hemispheres,' says Professor Hull, 'support the geological theory that there was a common centre in the Atlantic where life began, and that during and prior to the glacial epoch great land-bridges north and south spanned the Atlantic Ocean.' He adds: 'I have made this deduction by a careful study of the soundings as recorded on the Admiralty charts.' Dr Hull also holds the view that at the time this Atlantic continent existed there was also a great Antillean continent or ridge shutting off the

Caribbean Sea and the Gulf of Mexico from what is called the Gulf Stream.

These considerations would appear to sustain the contention of modern geologists that the bed of the Atlantic has undergone constant change, and that, indeed, it may have risen and sunk many times since the period of the last Ice Age, as Sir William Dawson believed. In the summer of 1898, a ship employed for the laying of the cable from Brest to Cape Cod was trying to fish up a broken strand at a point about 500 miles north of the Azores, and at a depth of about 1700 fathoms. The grappling-irons drew up soil and broken pieces of rock, which established the fact that the bottom of the sea at this latitude presents the characteristics of a mountainous country with high summits, steep slopes and deep valleys. They were evidently being caught on hard rocks, and drew up coarse striæ and small mineral splinters, fragments of an actual outcropping, sharp and irregular, a vitreous lava or tachylite, now preserved at the Musée de l'Ecole des Mines, at Paris. This species of lava, as is well known, can solidify into such a condition only under atmospheric pressure. If formed under 3000 metres of water it would have become crystallised, as has been proved by the researches of Lacroix, who examined the lava of Mont Pelée in Martinique, which was vitreous when it congealed in the open air, but became crystallised when cooled under a mass of previously solidified rocks. The inference is that the bottom of the Atlantic 562 miles north of the Azores was, therefore, covered with lava which was once above water, and the ruggedness of this shows that the sinking of the land to 3000 metres below the sea followed suddenly upon the emission of lava. Otherwise atmospheric erosion would have levelled inequalities and planed down the entire surface. This region is set in the zone of Atlantic instability, therefore it is a fair conclusion that it was recently submerged, probably during the epoch which the geologists call the present, says Termier, because it is so recent.

From such an array of geological evidence it may be conceded that we are justified in concluding that the hypothesis of a formerly existing land-mass in the Atlantic Ocean is by no means based on mere surmise. The fact that geologists of distinction have risked their reputations by testifying in no uncertain manner to the reality of a former Atlantean continent should surely give pause to those who impatiently refuse even to examine the probabilities of the arguments so ably upheld. But the most significant consideration which emerges is that this expert evidence is almost entirely in favour of the existence of a comparatively recent land-mass or masses in the Atlantic, and if we take into consideration the whole of the evidence, and the nature of its sources, it does not seem beyond the bounds

of human credence that at a period probably no earlier than that mentioned by Plato in his *Critias*, viz. 9600 B.C., this ancient continent was still in partial existence, but in process of disintegration—that an island of considerable size, the remnant, perhaps, of the African 'shelf,' still lay opposite the entrance to the Mediterranean, and that lesser islands connected it with Europe, Africa, and, perhaps, with our own shores.

III.

But we have even more valuable evidence from other sources than from geology alone. The evidence afforded from biological research is even more remarkable. Professor Scharff has made it clear that the larger mammalia of the Atlantic islands were not imported, and states that his endeavours to trace 'the history of their origin on the islands point rather to some of them, at any rate, having reached the latter in the normal way, which is by a land-connection with Europe.'

In the case of the rabbit, for instance, the presence of large hawks or buzzards observed by the discoverers of the Azores in 1439 led to the islands receiving the name of Açores, or Hawk Islands. Such birds usually live on mice, rats, and young rabbits. Indeed, it seems to be substantiated that the existence of the Azores had already been known to earlier navigators, for in a book published in 1345 by a Spanish friar the Azores are referred to, and the names of the several islands given. On an atlas dated 1385, and published at Venice, some of the islands are indicated by name, as Capraria, or Isle of Goats, now San Miguel; Columbia, or Isle of Doves, now Pico; Li Congi, Rabbit Island, now Flores; and Corvi Marini, or Isle of Sea Crows, now Corvo. Drouet has directed attention to the goat of San Miguel, with its antelope-like horns. This nomenclature given prior to the discovery—the 'official' discovery of the islands, that is—seems to justify the assumption that mammals such as the wild goat and the rabbit flourished there at that period, and reached the islands from Europe by a land-connection.

Certain zoologists recognise a distinct division of the marine area of the globe as consisting of the middle portion of the Atlantic, which they called 'Mesatlantic.' Two genera of mammals are assigned as characteristic of this region—the Monachus, or Monk Seal, and the Sirenian Manatus. Neither of these animals frequents the open ocean. Their several species inhabit the Mediterranean, the West Indies, and the coasts and estuaries of the West African and East South American sea-boards. The range of these marine animals seems to many zoologists to imply that their ancestors have spread along some coast-line which formerly united the Old World and the New at no very distant period.

The reptilian fauna of the Atlantic islands is almost entirely European in character. Among

the lizards, a North African and a Chilian form are allied. The large family of the burrowing *Amphisbænidae* is absolutely confined to America, Africa, and the Mediterranean region. In his monograph of the mollusca of the Atlantic islands, Mr T. V. Wollaston drew attention to the fact that the Mediterranean element is much more traceable in the Canaries than in the other groups of islands. He believes that the Atlantic islands have originated from the breaking-up of a land which was once more or less continuous, and which had been inter-colonised along ridges and tracts now lost beneath the ocean.

Professor Simroth, writing on the similarity between the slugs of Spain, Portugal, North Africa, and the Canaries, concluded that there was probably a broad land-connection between these four countries, and that it must have persisted until comparatively recent times. Dr W. Kobelt, who formerly ridiculed the Atlantean theory, later altered his views. Comparing the European with the West Indian and Central American faunas, he points out that the land shells on the two opposite sides of the Atlantic certainly imply an ancient connection between the Old World and the New, which became ruptured only toward the close of the latter part of the Tertiary Period. Dr von Ihering lays stress on the fact that no malacologist nowadays could explain the presence of these continental molluscs on the Atlantic islands in any other way but by their progression on land. He is also strongly in favour of the theory of a former connection between Brazil and Africa on biological grounds.

Sixty per cent. of the butterflies and moths found in the Canaries are of Mediterranean origin, and twenty per cent. of these are to be found in America. Some crustaceans afford excellent proof of the justice of the Atlantean hypothesis. The genus *Platyarthrus* is represented by three species in Western Europe and North Africa, one in the Canaries and one in Venezuela. 'There is,' says Scharff, 'another group of crustacea which yields such decisive indications of the former land-connection between Africa and South America that scarcely

anything else is needed to put that theory on a firm basis. The group referred to is that of the fresh-water decapods, the species on both sides of the Atlantic showing a most remarkable affinity.'

The occurrence of earth-worms is a peculiarly reliable datum in fixing the former geographical relationship of any given region. The ocean is an insuperable barrier to earth-worms, and when it is found that those of the Atlantic islands are identical with European and North African forms, little more remains to be said as regards a former land-connection.

Experiments have shown that certain snails cannot withstand prolonged immersion in sea-water. Yet these species are found alike in Europe, America, and the Canary Islands. It is therefore manifest that they must have progressed thence by land. Many similar parallels could be drawn from plant life, if space permitted.

And what of the presence of man on the lost Atlantis? The greatest caution is, of course, necessary in dealing with this particular phase of the Atlantean theory. But it is by no means impossible that the Guanches of the Canary Islands, when discovered by the Spaniards, represented the last vestiges of Atlantean man. The origin of the Crô-Magnon race, which entered Europe by way of the Biscay region about 25,000 years ago, is unknown, and good reasons have been advanced to show that this people, who possessed a very high degree of art and civilisation, may have been immigrants from the land-mass of Atlantis, then in a condition of slow disintegration, and that they reached Europe by way of a still existing land-bridge. However that may be, the Guanches of the Canaries were classed by the late Lord Abercromby, René Verneau and others as undoubted Crô-Magnons, similar to those whose remains are found in early Pleistocene deposits in France and Spain. It is out of the question that they could have drifted to the Canaries from Europe, and it seems much more probable that, like the animals and plants of the islands they inhabited, they were marooned on the island-peaks of the drowned continent.

A TALE OF THE ESKIMO.

By CAPTAIN H. T. MUNN.

TRAGEDIES sometimes happen amongst the laughing, forgetful denizens of the Arctic, and sometimes murders are committed, which are none the less murders because they are unproven and unprovable. But all these things are soon forgotten by the Eskimo, unless a boy comes to manhood and has been taught how and by

whom his mother was done to death. Perhaps he does not care. Perhaps, on the other hand, he exacts the full blood penalty; but if so, stealthily, quietly, and alone—the others may suspect, but they say nothing.

'Tabow-eetay' (good-bye), said the trader, as the whale-boat pushed off from the landing;

'and remember, I want to get fox-skins for those rifles, the ammunition, tobacco, and supplies; foxes and plenty of them, or there will be trouble.'

Old Koik-shadu nodded. 'We will try,' he said—'we will try very hard.' The trader turned and walked thoughtfully back to the little house; he was an American, who had had many winters' experience amongst the Eskimo of Roes Welcome and Repulse Bay. 'Old Koik-shadu is straight enough,' he said to himself, 'and he'll probably keep the other two in line, though they are both bad scoundrels; but I think I was a fool to give them so much debt, all the same.' Sail was hoisted, and the Eskimo were soon under way on the forty-five mile crossing of Roes Welcome, from Point Fullerton to Southampton Island. Old Koik-shadu, the leader of the party, was at the helm. The other men were one-eyed Oo-look-see, who tended the sheet, a scowling, shifty-looking rascal, his appearance accentuated by his missing eye, and Shook-aloo, who sat forward the mast, a good-looking Portuguese half-breed, the adopted son of Koik-shadu, and half-brother to Oo-look-see, also a Portuguese half-breed. Amidships were the women, the children, and the dogs. Man-ee-to, the wife of Koik-shadu, was a middle-aged woman, with two young children, and said to be the worst scold and most evil-tongued Eskimo on the coast. Beside her sat old In-ny-to, her mother, second only to the daughter in vituperation, a withered, hideous old beldame. On the next thwart sat Nat-ka, Man-ee-to's daughter, a woman about twenty-five years of age, quiet and sad looking, for reasons to be set forth later; on her knee sat her boy, a lad of five or six years old. These sat aft the mast, women and children huddled together. Between the next thwarts sat Oog-na-lan, now Shook-aloo's wife, a big, ugly woman, with a forceful will; and with her were Ar-tee-targ, Oo-look-see's wife, her two children, and her wrinkled old mother, Oyar-arg-lan.

Nat-ka had reason to look sad. Till lately she had been Shook-aloo's wife; but he had tired of her and given her back to her mother with her boy, taking Oog-na-lan as wife in her place. It was said that Oog-na-lan was the one who had effected the change by putting a charm on Shook-aloo, and she was certainly far too jealous of the younger woman to allow him to keep her as his second wife, even if he wanted to. Twenty dogs, four tents, some sleds, deerskins, supplies, cooking utensils, and camp gear, completed the cargo of the overcrowded boat.

The cross between Portuguese and Eskimo is a common one to meet on the coast of Roes Welcome, for the American whalers frequented these waters in the 'seventies and 'eighties with their nondescript and often shanghaied crews. There are plenty of Portuguese sailing out of New Bedford yet to the Southern whaling

waters. The mixture of blood is a bad one; the callous cruelty, violent temper, and faithlessness of the Portuguese, added to the fickle, easily-swayed character of the Eskimo, makes the most undesirable and unreliable half-breed in the Arctic.

The journey commenced badly. A gale of wind came away as they neared the Southampton shore, and in beaching the boat it was badly stove—some of the gear was washed away and more damaged. It was mid-October, a stormy month in these latitudes; the ground was already covered with a light snow-fall and frozen hard. Here it was old Koik-shadu made his fatal mistake.

Finding no cariboo on the flat land which comprises the southern part of the island, he decided to keep north along the coast and depend on the few seal they could get, till the snow was hard enough for the dog-sleds. Had he but started across to the eastern side of the island, packing the dogs and taking as little as possible beyond food and ammunition, all would have been well, for the wet swampy lands and small lakes were frozen, and the snow was but light. It was 120 miles to the east side, where they knew other Eskimo, their relatives of the same tribe, would be found, and but 80 or 90 miles to a small trading-station, established the previous year, at which were some natives and a white man. But to the north old Koik-shadu thought he would find deer yet lingering on the low-lands, and if there were no other Eskimo trapping there this would be the place to take foxes; so northwards they travelled, by very short stages, getting an occasional deer or seal, but with hunger ever dogging their footsteps.

A month passed and the outlook was bad. They were about forty miles inland now, at the foot of the range of hills which form the northern and eastern sides of Southampton Island, but many dogs had died of starvation, and some had been killed for food. When an Eskimo kills a dog for food, he is very hungry, for on the dogs depends most often the possibility of obtaining cariboo. The children wailed incessantly for food, and Man-ee-to and old In-ny-to kept up a ceaseless railing, abusing Koik-shadu day and night, till the toupik and later the igloo, or snow-house, became unbearable, and the old man would wander about outside, preferring the cold and darkness to their bitter tongues.

The younger men got a few deer occasionally, far back in the hills, but it is doubtful if they were dividing them fairly with the rest, their own wives and children and Ar-tee-targ's old mother getting the larger share. Perhaps Shook-aloo might have wanted to give more to Nat-ka and her boy, possibly he did not care; some are like that, especially Portuguese half-breeds.

Old Koik-shadu was at his wits' end; his wits

indeed were leaving him under the lash of the two older women's merciless tongues. One morning he harnessed five skeleton-like dogs to a small sled, and started back to the boat, where some blubber had been cached. It was said he did not enter the igloo the previous night, but talked to himself and the Spirits, outside in the bitter cold. The kindly, gentle, old man never came back, for the railing tongues and crying children had done their work. Maybe he drove out on the moving pack to what a sane man must know would be certain death, in the mad hope of getting across to the station for food and help—God knows! Neither he nor his dogs were ever seen again.

The young men spent a few days looking for Koik-shadu in vain, and then returned to the igloo. What talk passed between them that night, only they ever can tell: but that Oo-look-see and Oog-na-lan's voices cast the die against the rest, there is little doubt. The man hated the old women in the other igloo for their evil tongues, and he was, be it remembered, a Portuguese half-breed. The woman hated her younger rival; she too was determined, callous, and savage for her children, as only a savage can be.

Next day it blew a blizzard, but stealthy preparations went forward in the larger igloo. A discarded wife rarely speaks to her late husband and never to her rival, nor will she enter their igloo, but Nat-ka seems to have divined their thoughts. Perhaps her mother-love helped her.

The following morning Oo-look-see and Shook-aloo came into the old women's igloo. It was Oo-look-see who spoke—'We are going back into the hills for deer,' he said. 'You must stay here, for we cannot all move together with so few dogs, but we will return with meat as soon as we kill any. We leave you an old rifle, in case a bear should come here. We shall not be away long.' The old women were silent. They had been told—they knew well—it was their doing that the old man had been driven away, and now they were afraid, and perhaps a little ashamed. Only Nat-ka spoke. Kissing her boy, she gave him to Shook-aloo, saying, 'Take him with you; he is small and will not make much difference, and he cannot wait for food much longer. Ar-tee-targ will keep him if—if Oog-na-lan does not want him. Ah, you *must* take him. Is he not your son, too?' Shook-aloo nodded. 'Yes,' he said, unsteadily. 'I will take him; it is better for him to come with us.'

Nat-ka stood outside her igloo when the party started. She did not speak to Oog-na-lan, but she called Shook-aloo to come to her, a very unusual thing, as has been shown, for a deserted wife to do. Looking him in the eyes, she said tensely, 'If my boy—our boy—dies, my spirit will never leave you in peace till you

are dead too. It is your life as well as his you have to guard. You will not return. Let me finish,' she said quickly, for he would have denied the terrible accusation. 'Oo-look-see and Oog-na-lan settled it last night, though Ar-tee-targ tried to stop them. See, she is crying over there now. I know I speak the truth—it does not matter.' Shook-aloo's weak, handsome face was working convulsively. 'Go!' she said quietly; 'but remember the words I have spoken to you, if you wish to see many more summers.'

Nat-ka watched them move off. God knows what her thoughts were; she was discarded, deserted, left to starve in this snowy waste, yet she asked nothing for herself. She knew what her life was fated to be in the igloo with Oog-na-lan's venomous hate and stronger arm if she joined the party. Her boy was safe, or at least had a chance of life, for Shook-aloo believed her words implicitly and would look after him. Then some day he would grow big and Ar-tee-targ would tell him, for Nat-ka was her friend. Then let Oo-look-see have a care when he was on a lonely hunt in the hills, or if he and the boy met in their kayaks far out on the bay, where none might see the Law of the North dealt out. Hating the older women for their venomous tongues, and too cowardly to kill them mercifully with a bullet, Oo-look-see had persuaded his weaker brother to leave them to starve, and with characteristic heedlessness of life and callous cruelty, left the unoffending younger woman and the two children to perish with them.

Nat-ka watched as they trailed slowly away, and on a rise of the land she saw them halt. After a minute's eager talk Shook-aloo ran back a few yards and beckoned her violently to come and join them. She stood like a statue watching him, and when, after a last effort, Shook-aloo turned and slowly joined the now moving party, she too turned with a choking sob to the igloo and crept inside.

Within one sleep—two days' travel—of the igloos the party camped, and for four months did not make their presence known to their friends to the eastward, or to the white trader and his Eskimos but two sleeps away. When they knew the deed was done, and the dead could tell no tales, the party came down to the trading-station, with a story—varied in detail from day to day—of their great starvation, which was ugly to hear, but was considerably belied by their appearance.

And what was the story of the igloos when at length they were visited? Man-ee-to had died the last, and the gnawed bones told the usual ghastly tale of a starvation camp: but one skull had a bullet hole in it, which could only have been self-inflicted—a shot through the roof of the mouth. It was Nat-ka's!

Chambers's Journal

SEVENTH SERIES

THE CULT OF SPORTSMANSHIP.

By A. W. THOMSON.

EXTRAORDINARY though it seems, some folk associate sportsmanship almost entirely with people who go fishing, shooting, hunting the fox, or who have a passion for outdoor life and games generally. Forgotten are those who, by age, or a decree of Providence, or general circumstances, cannot do these things, and yet, in their way, may be the very jolliest of sportsmen. After all, those who indulge in blood-sports (a vulgar term that should be hurled from our language), and the jolly game-lovers, are but lusty tribes of a large family. Surely there must be a finer definition comprehensive enough to be of universal utility and to make a universal appeal to the human heart.

To get nearer the thing, cheek by jowl if possible, if you love life and mankind in a hearty, sincere, and generous fashion, you are in this way sportsman enough. It is a title full of honour, a sort of *noblesse oblige*. Of course, if you belong to the grand army of sports and games devotees, your sportsmanship is popularly apparent: it is of the common or garden everyday type, and needs little comment. Again, if you dearly love to truckle with those righteous uncertainties known, in any or all of their variety, as sporting chances, you are yet another class of sportsman. But, mark you, if you be a sportsman of this category, you will be faced with the truth of the old adage that it is better to be born lucky than rich. This type really must scramble over its fences somehow, and, as it were, finish respectably within the hunt. Otherwise, quite a number of folk, arguing that nothing succeeds like success, will have it that it is a poor enough type after all. If you apply this sort of sportsmanship to affairs, and cannot take your obstacles, you are in some danger of taking a toss into the bankruptcy court, or, as a lighter fall, into some degree of obscurity. As practical life is a thousand times fuller of obstacles than any hunting field, the cult of sportsmanship here presents to you one of its most useful functions, schooling to face and overcome these obstacles.

You may love horses, dogs, guns, fishing-rods, golf, cricket, football, tennis (not to speak of croquet), and your bookmaker so long as he loses, even as you love your wife. In common acceptance you are thus a sportsman of the

deepest dye. Yet you would think that this virtue of passionate large-heartedness, though it makes you very sporting indeed, would have to be combined with other delectable attributes to blossom you as a sportsman-de-luxe. To love those things in fatuous fashion is something like growing the seeds of sportsmanship to wood instead of to flower. Your sportsmanship inclines without care and circumspection to defeat its own end. On the other hand, if you jump from the frivolous right across to the heroic by setting out to climb Mount Everest, or to navigate Niagara, or to cross the Atlantic in a cockle-shell or an aeroplane, you are carrying the thing to another extreme, also not without drawbacks. It is magnificent and heroic practice of the theories of the cult, and you will gain the worship of all noble-minded people; but a good many douce, sound members of the community, who figure two and two to be four and never to be either five or three, will lift you down from your pedestal to regard you with somewhat slanting eyes; a few may even doubt if you are a wholesome member of society, being, they say, too much addicted to romance. In considering both of these extremes you will be more than ever convinced that nothing succeeds like success. Of a truth, the alpha and omega of your cult is success.

It appears that an up-to-date cult of sportsmanship is, or should be, something with a distinct smack of the ancient Roman training of the arena. You could call it a modern adaptation, with the heroic spirit moulded to meet the modern fabric of life. The heroism will be neither so spectacular nor so apparent, being the heroism of the ploughshare rather than that of the sword. But as heroism is still heroism, no matter how it is tilted at, your cult sows the war-like variety to grow as reach-me-down ready-made stuff for use when required. Thus you preserve the dictum that Waterloo was won on the Eton playing-fields. The objective is to turn out real spry, lively fellows, full of fight, grit, honour, sympathy, and intelligence, and loving to take off at lawful obstacles. Kicking a football, hitting a cricket-ball, riding a steeplechase, or even catching a trout, all jolly exercises that you love, have a greater significance, being preliminary

examinations of one sort to justify your entrance to the main thing. In your youth they train you to overcome greater difficulties that lie in wait on your horizon, like thugs and thieves, to pounce on and beset you. And, paradoxically enough, they provide you with relaxation from those difficulties. Sport seems to balance itself by this dual rôle of enabling you to forget your affairs, and, at the same time, gingering and prompting you to tackle them by instinctive combativeness. Quite a jolly thing is this cult of sportsmanship.

To most of us the business of living in comfort, happiness, and citizenship is a pretty tough job, chock-full of thrills and of what Robert Burns called glorious uncertainties. And here comes in perhaps the jolliest and most pleasurable and priceless function of sport, that of fermenting out the indigestible by-products bequeathed to you by your job. It is the jolly bacteria-thing (to be scientific and up-to-date) that raises drooping hope, tired nerves, and gingers up a flagging fighting quality of the soul. The idea is as the yeast of bread raising into wholesomeness the tough dough. The trying, the conquests, and the backslidings, two steps forward and often two back, make up, however, a spicy dish to the fellow who loves the game of his job as a sportsman should. And thus you would jalousie that the spirit of sport is the best and most natural stimulant for the everyday whirligig.

Here is Stevenson's definition of the fellow fitted for the battle of life: 'Now the man who has his heart on his sleeve, and a good whirling weathercock of a brain, who reckons his life to be dashingly used and cheerfully hazarded . . . keeps all his pulses going true and fast, and gathers impetus as he goes, until, if he be running towards anything better than wild-fire, he may shoot up and become a constellation in the end. Lord look after his health, Lord have a care of his soul, says he; and he has at the key of the position, and swashes through incongruity and peril towards his aim. Death is on all sides of him with pointed batteries, as he is on all sides of all of us; unfortunate surprises gird him round; mim-mouthed friends and relatives hold up their hands in quite a little elegiacal synod about his path: and what cares he for all this? Being a true lover of living, a fellow with something pushing and spontaneous in his inside, he must, like any other soldier, in any other stirring deadly warfare, push on at his best pace until he touch the goal.' There is a sportsman for you and no mistake! He has a pretty good dose of the bacteria-thing that gathers him impetus as he goes, like a sum in compound interest or a snowball gathering snow.

You will perceive that the cult of sportsmanship aims at something more than the fascinating study of, and engaging in, actual

sports and games. These are irradiancy from the facets of the thing, beautiful, most lovely materialistic expressions. But you must not be blinded by this light, and make a god of it, for that is like overdosing yourself with French dishes, good liqueurs, health salts, or even good Scotch broth, than which in moderation nothing could be better. Its real utility is to rouse men to action. The whole bias of human weakness goes towards inaction, stagnation, and selfishness; and therefore one should at least try to do one's bit toward making the world a trifle better. Amongst the buds of character aimed at one might mention the promotion of fitness, the principle of *mens sana in corpore sano*, the spirit of co-operation, power to bear failure and success, quick and sound decision, cultivation of excellent habits, special training for any pursuit, object, or calling, the idea that helps lame dogs over stiles and gives a sporting chance to weaker vessels, and, not least, the power of social levelling. These are all variegated outer blooms of the rose of this cult of sportsmanship, a spirit and outlook that humorously regards every difficulty as a jolly good game that should be won. You will thus conclude that the cult carries with it a good deal of the practical sort of religion, and involves, without your altogether realising the fact, a distinct whiff of the Ten Commandments, not to speak of the Shorter Catechism.

Sportsmanship thus brings out some of those qualities loved by the copy-book moralist, and useful to all. You have got a touch of the true elixir, the brightest of halos lights your path, and a very comforting assortment of the real secrets of living and its justification is yours. You are confident of a quaint mastery, quite a worthy conceit, and a power to handle the reins of circumstances; and you fear the side issues of your sports and games, called temptations by some people, no more than you fear such attractions as strong wine, engaging femininity, idolatry of tinsel, or your mother-in-law. It comes home to the mind that the work of life dwells with the play of life not as a lodger, nor even as a brother, but that they go best together like man and wife. Yet some of us find a difficulty in loving work, and others find a difficulty in loving play, even as we find it an effort to love a mother-in-law, though we know all three clearly and justly ought to be loved.

It is true that to become a true sportsman you need not necessarily ever touch a cricket bat, or ride a horse, or shoot a game bird, or even play golf or quoits. If you set out to overcome an obstacle worth while: for example, if you set out to found a business, full knowing that it will either make or break you, you are already as good a sportsman as though you had set out to carry a ball past fifteen other fellows and triumphantly set it down behind the posts.

But—and here is the point and essence of all the potter set out in this paper—if you have learnt to get the better of fifteen other fellows in this way, that will help you enormously to get past lots of other obstacles in whatever undertakings you come up against in your crusade through life. For you shall have a possession that stiffens you against great disasters. You shall be buttressed by your

training to love the noble strife and the long hazard of a life of high endeavour as the Elizabethan Admirals loved the high conquests and unceasing adventure. You shall love it with an endeavour that gathers in impetus as it goes. What more proof than this that the high sports and games are so intertwined with the high works as to justify and ennoble the cult of sportsmanship?

MAN—OR BEAST?

CHAPTER II.—*continued.*

II.

ARMINEL, whose gay mood had vanished, sat on the parapet of a bridge while her husband and Joseph jacked up the car. It was then that she noticed something was wrong with Joseph. He was about twenty-five years old, a thin, willowy Madrassee Christian, with long, nervous hands, every bone articulated under the tight brown skin. Arminel had noticed those hands when he was driving beside her. He drove excellently, and had never yet lost his head, though there had been one or two escapes with a narrow margin. But those hands were neurotic—that womanish face, with its great, soft eyes, was neurotic, behind its mask of a well-schooled servant. She had wondered how he would acquit himself if sudden danger threatened, of which he had no experience, such as the car catching fire, or getting out of its depth while crossing a ford. She hoped Peter might be driving if that sort of thing happened; Joseph might possibly rise to the occasion, but Peter certainly would. He had no nerves, and his brain worked like lightning in an emergency. . . . Her attention was drawn to Joseph now; Peter was annoyed with him.

'You're darned slow—get a move on!' her husband said suddenly. 'We don't want to be here all night!'

'Yes, sir,' agreed Joseph meekly, wrestling with the burst tire while Leyton levered it with the tool. Arminel saw that Joseph's shaking hands were almost useless. A swear-word reached her, and Leyton straightened himself.

'What's the matter with you—got fever?'

'No fever, sir; I want do it quick,' answered Joseph, renewing his efforts.

Early darkness was creeping upon the gorge, the sky was ominous with cloud, and they were a good twelve miles from Dehra. At any moment a fresh storm might wheel upon the hills, and Leyton didn't wish to be caught a second time. Driving on that road at night in a tropical deluge was no joke, with the glass screen obscured by rain; you had to put it down, and then you were drenched. He glanced

at the sky behind, and again tackled the tire. 'Stick to it, you idiot!' he commanded after a minute. 'What are you peeping about for—think something's going to jump on you?'

'Don't rattle him,' pleaded Arminel; 'the poor thing's doing his best. I expect he has a little fever and won't own to it.'

'Fever or not, he's got to pull his weight. Now then, stop gazing at the scenery and get this tire on.'

Between them they accomplished it, the whole job having taken nearly half-an-hour. Dusk had stealthily thickened in the hills, and the flashes of the distant storm pulsed fitfully in the gloom. Leyton put Arminel in the back seat—she would be more protected there if it rained—the lamps were lit, and they started. A couple of miles onward the car slowed and stopped.

'What's the matter?' asked Arminel sharply.

'Engine's not pulling properly. I'm going to have a look.' He shut off the engine.

'Never mind as long as we can get on,' she urged; 'we shall have another storm if we don't hurry.'

'No—not stop,' quavered Joseph, peering oddly to right and left. Leyton, astonished, turned to look at the man's face.

'Oh, *do* go on, Peter!' said Arminel irritably.

During the short halt darkness seemed to have dropped like a pall. Everything was curiously quiet, save for distant growls of thunder. Edging the road, on their left, was a steep, densely-wooded cliff. On the right, topped by a line of aloes in flower, a bank went sharply down to a wide *rhov*, or river-bed, dry but for a small stream in the centre. Between the tall stems of the aloe flowers the *rhov* was visible; there was just light enough to make out the grayness of the shingle, the gleam of water, and blurs of pale grass at the near edge. Suddenly Joseph clutched his master's arm, pointing speechlessly at the *rhov*.

'What is it?' snapped Leyton, looking at the dim tract below in spite of himself. He could see nothing unusual. He reached for the self-starter; as he did so there was a quiver of lightning, and he heard Arminel make a

piteous little sound. Joseph's idiocy had scared her, he thought. He turned round to his wife. 'That priceless fool saw cheetal or something in the *rhov*, that's all. He's stark silly to-night—I'll have to sack him. Why, what's the matter, sweetheart?'

'I saw, too. Do—do cheetal walk on their hind legs?' Her voice shook as if she was shivering with cold.

'Of course not—cheetal are deer; then it must have been langurs. Don't be—'

'Peter,' she interrupted, 'there's . . . something horrid about to-night. I'm not often a coward, but, oh, *do* go on; I'm nervy.'

He peered at her small white face; she looked like a badly-scared child. It was no use arguing, and he silently cursed Joseph. 'All right, darling, we'll cut home; like to sit by me?'

Before she could answer, there was another glare of lightning, and hard upon it, Joseph, with a whimpering, dog-like cry, tumbled out of his seat, wrenched open the door, and shot into the back of the car. Grovelling and clutching Arminel's knees, he habbled through chattering teeth, 'Oh, mem-sahib—tell sahib to drive quick. I stay here—I stay with you. Safe here—they not come for you!'

III.

Leyton, after the first petrified surprise, got out and grabbed the cowering man in savage silence.

'Let him stay here—please, please, Peter—I'll sit by you,' Arminel begged.

Leyton, still in wordless rage, hauled Joseph out by the coat-collar, shaking him roughly; Arminel stumbled out and took her seat by the wheel. With a final shake and a curse, Leyton shoved Joseph onto the floor of the car and slammed the door. As he started the engine and took the wheel there was a brief electric pulsation, and Arminel winced, with a stifled cry. He thought it was caused by the lightning—her nerves must be in shreds. The next moment, in the act of releasing the clutch, he saw what made him stare into the darkness ahead with a pricking at the roots of his hair.

'Sort of hypnotism,' he thought; 'suggestion from the others' jim-jams. I'm seeing things that aren't there!' He slowed, with an instinct to face the music and quell the infection of fear. 'Langurs,' he said calmly. 'Funny how darkness exaggerates things; but they're biggish monkeys—quite harmless, of course—'

The dog-like whimpering of Joseph came from the back.

'I'll give that skunk the hiding of his life,' he rasped. The car slowed still more, and with a misfire or two the engine stopped.

'Not enough gas,' muttered Leyton, altering the regulator and reaching for the starting-handle. His hand dropped; vivid, blue-white light, lasting some seconds, showed three bulky shapes

blotching the road, one a little forward of the others; squat, immensely broad, with hands almost touching ground, limbs and bodies blurred with coarse hair, the huge neckless heads sunk in gigantic shoulders. The faces, intently staring, were all but the brute faces of orang-utans, but not quite. They looked just not apes and just not men, that was the unspeakable horror of them. They *must* be real, thought Leyton; he could see their lambent, yellowish ape-eyes blink at the car lamps—there couldn't be those details if they weren't a fact. Must have broken out of a menagerie! At this sane idea for a moment he forgot his wife, forgot his spasm of fear. Of course they had escaped from some show, and the thought of coming back by daylight with men for a round-up excited him. A voice he hardly recognised rose from beside him, thin and high, 'Peter—Peter!'

'All right, dear; we're off.' To his relief the engine roared and the car jumped forward. 'They've got out from some travelling circus—they'll be scared to fits in a minute—' Even as he spoke, with the tail of his eye he caught sight of more dark, bulky shapes, heads and shoulders, stealthily moving in the undergrowth just below the road, on the bank which sloped to the *rhov*. Surely the faintest blur of light surrounded each shape, outlining it nebulously against the gloom? He forced himself to look squarely. One of the creatures had almost reached the top of the bank; it held to the pole-like stem of an aloe-flower with a long, a horribly long, arm. They *must* be real, his sanity insisted; even though there was a drove of them—even though they glimmered! Something to do with the electrically-charged atmosphere—something in their hair—ugh! He put on speed with a rush, and shot towards the shapes still in the centre of the road, waiting. . . .

'They'll leg it—they're only inquisitive,' he said aloud, determined, if they didn't move, to drive right into them. The car was less than five yards from the three—Leyton could see them disgustingly clearly, when, as the glare of the head-lamps struck them, they faded—there was no other word—faded and apparently were not. As the car passed the spot where they had been visible, Leyton felt a dragging, clawing clutch on his right arm, which slid off as he jerked violently. There followed a scream like a wounded hare from the back of the car. 'Get a knife—tiffin-basket,' Leyton ordered. The basket was at Arminel's feet; steadied by having to act, she found the big bread-knife.

'Hold it ready.' Keeping going as fast as he dared, Leyton looked into the back. He couldn't see Joseph, but he was probably on the floor; something was there, but it seemed to be Arminel's light motoring wrap. 'Look behind—at the road. Can you see him?'

She looked. 'I think he's lying on the road. Peter, we must stop—we couldn't leave him.'

'No . . . if he isn't in the car. Look here, could you drive back to Dehra? I might want men sent out to help with Joseph.'

'I've never driven at night, but I—think I could.'

'Good girl—*my* girl! I bet you do it top-hole. Now, kneel on the seat and make certain he isn't down there.'

She did so. The back was empty.

Leyton slackened speed. 'I don't know if I'm right to go back,' he said, as if thinking aloud; 'I've got you to look after. He must have jumped out and come a mucker—we were going a good pace. Someone's sure to pick him up, and after I've taken you home I'll come straight back—'

'We must go back—now.' Her voice dragged as if intensely tired. 'We've got no choice—we should never forgive ourselves. . . .'

Leyton thrilled with pride in her pluck. 'All right.' He turned and went slowly back. The road was empty.

IV.

'It's no use; he must have hidden somewhere.' Leyton was aware of a feverish desire to be off, not wholly on Arminel's account.

'He wouldn't do that,' she said faintly; 'he would have kept to the road. Sound the horn—he might be farther on—running.'

Leyton squeezed the bulb again and again; the blare was answered from the heights, but the road remained empty. It was all but dark; the lightning was rarer, and an oppressive, listening stillness brooded in the hills. 'Joseph must rip,' said Leyton decisively; 'if those . . . escaped apes have got him I can't help it—I'm going to run you home.'

He prepared to turn. Arminel was straining her eyes towards the *rhov*; at the next flicker of lightning she gripped his arm. 'Down there—oh, Peter, he's down there! They've got him because he was so afraid. . . . You're not afraid—they can't hurt you. . . . Oh, Peter!' It was the piteous pleading of a terrified woman, but one whose pity was greater than her terror, and her belief in him, her husband, greater than either.

'Certain you saw him? Whereabouts?'

'Lying in the *rhov*, nearly in a straight line from here.'

Leyton got out and took the knife, feeling its sharp edge with satisfaction mixed with an acute sense of the absurd. A bread-knife!—still, better than nothing. With utter inconsequence, a verse in the Mohand bungalow visitors' book shot to his mind:

Little skinny chickens,
Little smelly eggs;
'Twould have been the dickens
But for little pegs. . . .

' . . . But for little pegs.' It beat in his head, over and over, and with its repetition his acute tension relaxed. That jingle belonged to a sane

world, a humorous world, and he, Leyton, was going to stay in it. The chap who wrote that would have found something comic even in this damned nightmare.

'Now, look here, dear'—he patted Arminel's hand—'sit tight at the wheel, ready to do exactly what I tell you. I may have to shout orders from down there.'

'Yes. Take the rear lamp—you won't be able to see, except when there's lightning. . . . Peter, do you know . . . what they are?'

'I told you—couldn't be anything else.'

'They're not . . . not alive, like you mean. . . . They're not—like we are.'

'Thank the Lord, no!' He laughed shortly, unhitching the rear lamp.

'Peter, I want you to understand. They're not . . . flesh and blood. I don't believe they can hurt any one unless one's afraid—afraid like Joseph—'

'Don't you worry—I'll be back soon,' he called over his shoulder, and walked to the road's edge, where the aloes grew. He stopped; a faint increasing murmur reached them both from ahead. 'Motor coming—good business!' He ran back and sounded long blasts on the horn. In a few minutes powerful head-lights blazed round a bend, and a large car slowed and stopped alongside theirs. Colonel Buxton got out, followed by a younger man, both in shooting kit.

'Hullo, Peter,' hailed Buxton. 'Car in trouble?—anything we can do? Frome and I have been camping near Roorkee, duck shooting. Why, there's Mrs Peter!' He went to greet her.

'My driver's gone clean off his nut, or what looks like it,' said Leyton. 'He jumped out, and the wife says she's seen him in the *rhov*. Could you and Frome lend a hand with getting him back?'

'Of course,' said the colonel quietly. 'Mrs Peter, you'd better get into our car. Sit by Frome's man—he's an old soldier—a Gurkha—you'll feel quite safe!' He smiled; she put out an ice-cold hand, dumbly, and he squeezed it.

'We'll soon be back,' called her husband; then lower, to Buxton, 'Better bring a gun and a few cartridges—never know what you'll see here at night.'

V.

Buxton, with a keen look at him, fetched and loaded his gun, and stuffed some odds and ends into his big pockets. The three men, Leyton leading with the colonel's electric torch, stepped through the line of aloes, climbed down the steep bank, thick with undergrowth and small trees, and stood in uncertainty on the flat below. Elephant-grass and patches of camel-thorn stretched before them, and then the bare shingle of the *rhov*, vaguely seen in the half-darkness.

'Afraid it's a wild-goose chase,' said Leyton, casting the torch-light as far as possible.

'Arminel couldn't really have made him out from the road.'

Buxton was staring into the gray gloom; after a moment he pointed in silence. Frome, of the Forest Service, and a keen shikari, whispered, 'What—leopard?'

'Men, I think—gathered round something.'

Leyton said nothing.

'There are a few huts near the *rhov*, about half a mile from here,' said Frome; 'perhaps your man shouted and the natives found him.'

Still Leyton said nothing.

Buxton walked on, the others following. A few minutes of stumbling silence, and he stopped. 'Come on in line,' he said shortly.

They had gone a few paces, when a vivid blaze of lightning lit the *rhov*. It lasted some three seconds, and in it the colonel swung up his gun and fired both barrels. The shots echoed in the hills like a blasting explosion; then silence, and a darkness intensified by the previous illumination.

'What was it? Not men, or you wouldn't have fired. Wish I'd brought my gun!' blurted Frome, all agog. Leyton waited tensely for Buxton's answer, which didn't come immediately.

'Hard to tell what it was,' he said at last. 'Come on, there's something there still.'

The something was Joseph, stark naked. He lay on his back, his eyes closed, a sickly, olive-green tinge over the brown of his face, and with froth at the lips. Leyton shone the torch while Buxton knelt to examine him.

'... Had some kind of fit... Ah! arm dislocated... and ankle wrenched—swelling up fast; jumping out of the car, of course. Lucky he didn't break a leg.'

'What's become of his clothes?' queried Frome, peering about. 'Hullo, here's some relics—by Jove, nearly shredded to bits! Could he have been struck by lightning, colonel? I've heard of a man having his boots ripped off by it, and beyond a singeing he wasn't damaged.' He fingered the remnants of khaki drill and white cotton.

'The lightning we've had for the last hour was reflected from over the Himalayas,' said Buxton dryly, unwinding one of his puttees and taking off his boot. Sitting down, he put a stockinged foot under Joseph's armpit. A deft pull, a sickening click, and the arm went into the socket. The man's eyelids never flickered. The colonel felt his heart again; its beat was hardly perceptible. He poured brandy into the cup of his flask and dribbled a little between the clenched teeth.

VL

'I say—I suppose he isn't dead?' said Frome in an awed voice; 'he looks pretty ghastly!'

'So would you, with a shoulder out and a sprained ankle,' answered Buxton, unwinding his other puttee.

All this time Leyton had been silent. Frome

noticed that he stared frequently into the gloom, and that he held the torch unsteadily. 'What's your theory?' he asked, consumed with curiosity. There was something funny about this show... Then he saw that in Leyton's right hand was a big knife.

'What on earth's that for?' he demanded; 'what did you expect to be up against?'

'Oh, thought it might be useful,' answered the other slowly; 'budmashes¹ in some of these villages. Before you came, I thought I might have to intimidate somebody—nothing else to do it with.' Frome gazed at him, intensely puzzled. He had known Leyton for several years, had been tiger-shooting with him, and had heard how he had won his D.S.O. in France. He would have said you couldn't frighten Peter Leyton. To-night he gave the impression of a man who was afraid, but who had a tight hold on himself.

'Now then, Frome,' said the colonel, who had bound Joseph's arm to his body with the puttees, 'I want you to lend your coat, if you will. You're an out-size chap—d'you think you can carry him? It's better for one man to do it.'

Frome gathered up the limp, reedy body with ease, his coat buttoned over it. Leyton went first with the torch, Buxton bringing up the rear. Frome heard the colonel open the breech of his gun and slip in cartridges; and once, during a lightning-flash, he heard him stop, as if he was looking back.

Arminel called the colonel when Joseph had been laid by the roadside, and the other two were rigging up a bed in Frome's car with the camp kit. 'Is he dead?' she asked, almost in a whisper.

'Only in a sort of faint. He injured himself falling out of the car. I think he'll come round when I can see to him properly.'

'I don't think he *fell* out,' she said, very low; 'I think he was pulled out—'

'Well, he came a pretty nasty cropper, however it happened. Now, Mrs Peter, your husband's going to run you home, and I'm going to take your driver to my bungalow; I'd like to have him under my own eye for a day or two.' He helped her out; she could scarcely stand, and he made her drink a little brandy, sitting on the step. Then he got a blanket and wrapped it round her; she was shivering as if with ague, though the night was warm.

Leyton put her into the front seat of their own car, and was about to start. Buxton went round to him. 'Get the wife to bed as soon as you can, and keep her mind off to-night.'

Leyton nodded. 'I want to talk to you, colonel—'

'I know; but wait a day or two, and keep your own mind off it too, if you can. Good-night; I'll let you know how your man goes on.'

¹ Bad men.

CANADA'S POTENTIAL MEAT-SUPPLIES. CATTALO, OVIBOS, AND REINDEER.

By ARTHUR P. WOOLLACOTT.

I.

MEAT-EATERS are a pugnacious, quarrelsome lot. Biologists assert that Japanese imperialism began when that nation added meat to its bill of fare. The flesh-pots have often been blamed for the world's indulgence in alcohol. Men of vision for several decades past have been emphasising the alarming fact that the meat-supply of the world is rapidly becoming less, and co-incident with meat depletion was to be observed the growing sentiment in favour of Prohibition. Whether there is a connection between these phenomena is a matter for speculation.

But man is always interfering with the machinery of life. Moreover, he has not yet reached the stage of innocence which regards meat-eating as a major sin, and consequently when the statisticians tell him that the ranges which formerly raised beef animals are now rapidly being given over to field-crops, and that man is increasing more rapidly proportionately than the animals upon which for ages he has been accustomed to feed, he immediately sets to work to put back the clock by devising novel methods of propagating beef animals.

Hence we have three projects in Canada which are of especial interest to those who will still continue to hanker after the flesh-pots.

The branch of animal husbandry of the Department of Agriculture is engaged in producing a strain of cattle by crossing the buffalo with the domestic cow. It is expected that the resulting cattalo will populate the northern prairies and provide in time vast numbers of hardy beef animals.

Again, in the Canadian arctics are large island-areas where, during the long days of summer sunshine, a surprising acreage of fodder plants provides food potentialities of unknown extent. Here within a generation will roam large herds of the domesticated musk-ox or ovibos, the meat of which is said to be equal to the best beef.

Between these two zones are the barren lands of the sub-arctics, the present habitat of caribou, estimated to be anywhere between twenty and forty million in number. These will gradually be supplanted by herds of domesticated reindeer crossed with the wild caribou, which is larger in size but biologically identical, and if all the plans of the Dominion government succeed, there will ultimately exist in northern Canada a meat-supply of vast proportions.

It is officially stated that there is no limit to the possible extension of these industries if gone about properly and on sound lines.

The cattalo project is more or less familiar in its main features. But because the buffalo is better known than either caribou or ovibos a certain amount of romance attaches to the idea of crossing the picturesque bison of the plains with the barn-yard cow. The production of cattalo that can live on the country and thrive in zero temperatures, and yet yield a quantity of beef greater than that from the ordinary steer raised under similar conditions and of equal if not better quality, is a matter well worth the attention of our experts in animal husbandry.

Such a hardy strain would be a great asset to farmers and ranchers throughout the zones where cold winters are a drawback in cattle raising.

II.

That famous company of adventurers trading into Hudson Bay, whose exploits have added so much to the romance of Canadian history, has apparently tried everything once, including the breeding of buffalo, and it is interesting to note that the company is again to the fore as a pioneer, this time in a meat industry that is likely to prove more profitable in the long-run than all its other ventures combined.

As far back as 1842 the servants of the company at Fort Edmonton captured buffalo calves and let them run with the cattle. In a few years the bison increased to a herd of thirty, but, oddly enough, did not cross with the domestic animals. One day a great herd of bison darkened the green undulations in the distance, and the call of the wild became too strong for the semi-domesticated buffalo, which kicked up their heels and vanished with the wild herd.

Since then efforts have been made in the United States and Canada to obtain a new type of beef animal by crossing bison with cattle. Perhaps the most successful efforts were those of Mr Mossom Boyd, of Boycegeon, Ontario, whose herd of twelve hybrids and eight cattalo was taken over by the Dominion government, and is now located in the Buffalo Park at Wainwright, Alberta, under the control and supervision of the branch of animal husbandry of the Department of Agriculture. On account of the age of the animals, however, the experts consider it necessary virtually to begin all over again, and because of certain difficulties encountered in breeding, it has been decided to use the yak as an intermediate factor in the problem. Pure-bred bison bulls and domestic cows produce a hybrid, which in turn beget cattalo, and it is the purpose of all the ex-

periments to fix the type of cattalo. The yak is expected to aid materially in this process. This animal from the cold plateaus of Asia, long since domesticated and the inseparable companion and trusty servant of his Tibetan master, is about the size of the Aberdeen Angus, and is noted as a wonderful ranger, able to withstand the most extreme cold, since it is accustomed to rustle its living through the long severe winters of its habitat. It is not subject to disease, and as it is zoologically the connecting link between bison and cattle, and has so many admirable qualities of its own, it is expected that its introduction into the problem will greatly facilitate the production of a breed of hardy beef animals to populate the colder areas of the Dominion. Travellers through the Rockies are familiar with the sight of the herd of yak confined on a range in Banff Park.

It has been demonstrated that cattalo can thrive on the country without attention from man. They winter through the severest seasons, and are in good flesh in the spring. Their possible range extends from the regions in the plains, where cattle-raising ceases to be profitable by reason of the cold, up as far as the barren lands. This large area, where the climatic conditions are unsuitable to the raising of ordinary cattle, is practically useless for any other purpose than that of grazing. The fodder vegetation, however, is ample in winter as well as summer.

Canada, then, has a large suitable area at present of no value in production; but with a little expenditure in establishing the foundations of a future breed of new cattle to occupy these ranges, the now worthless territory may be made to add millions to the national wealth. With a new race of stock, brought about by the cross-breeding referred to, these cold-ridden lands will assuredly be used for extensive ranching purposes, when, as is now taking place, the present grazing and hay lands are cut up for mixed farming. It is the intention that the fruits of these experiments will later be made available to every farmer and rancher desiring to profit thereby.

The materials involved in these experiments have an interest in themselves.

Canada possesses the largest herds of buffalo to be found anywhere. Seven thousand plains buffalo are confined within the great fenced enclosure at Wainwright, Alberta, and several smaller herds are to be found in other parks, while in northern Alberta and the adjacent territory there are one thousand five hundred wood buffalo ranging freely in their original wild state. These animals are the descendants of those that escaped the Indians of former days and sought refuge in the wooded regions of the north, where they have since thriven unmolested. They are bigger, stronger, finer-looking, and more enduring than the plains bison, with which, however, they are identical.

This wild blood, acclimatised far north, will prove a valuable factor in future cross-breeding. The advantages of hybrids and cattalo over domestic cattle are of such a nature as to make the new stock even more desirable for beef and other purposes than their progenitors.

The hide provides a robe of great durability and is very rich in colour. It has been stated that these hides should fetch a hundred dollars each.

The animals are rugged, and will face the severest storms without drifting like cattle; nor are they ever cast on hillsides, and they are not susceptible to disease. They are remarkably good rustlers, and after wintering out are in higher flesh than domestic cattle. As beef animals they carry an exceedingly high percentage of beef along the back, which is the most valuable part of a beef carcass, and the inheritance of this quality is noticeably present in all cattalo having in them the blood of bison.

Rib-roasts from cattalo have an upper-cut nine inches deep.

The cattalo experiments are still in the initial stages, but already hold a promise of considerable economic value.

III.

The cattalo range of the future may overlap that of the musk-ox or ovibos. Indeed, the cattalo, musk-ox, and reindeer kings will be lords over immense tracts north of Sixty, for in those regions the winter climate is too severe for ordinary cattle and the growth of cereals, and consequently may be regarded as permanent grazing areas where the animals named may range in the open the year round.

The area available is roughly estimated at a million square miles. There is abundant vegetation in summer, which forms nutritious food for grazing animals in winter as well as in summer, as Nature has her own satisfactory way of curing the fodder crops.

There are good grounds for believing that the domestication of ovibos alone may result in the far north becoming a great permanent meat and wool producing area.

For the past few years Professor W. T. Hornaday, curator of the New York Zoological Society, has had a group of ovibos under observation in the Zoological Park in New York City, and he is fully convinced that they can be successfully domesticated on a scale large enough to be commercially profitable.

Readers of books on Arctic exploration have become familiar with the animals' tendency to form a circle, with heads out and calves and cows in the centre, when attacked by man or beast. For ages the improvident Eskimo was in the habit of giving full rein to his blood-lust, and invariably killed off these bands to the last animal. It is evident from their remains, and the reports of early explorers and

travellers, that at one time ovibos roamed over the north half of the continent. To-day they are comparatively few in numbers, being confined almost entirely to a narrow shore strip extending from Hudson Bay to Coronation Gulf. However, they are more plentiful on Melville, North Devon, Axel Heiberg and Ellesmere Islands, and on the north-east coast of Greenland.

Mr Storkor Strokerson, for instance, killed 400 in 1917 on Melville Island for his meat supply, and estimated that there were at least 4000 on the island.

The Arctic lands are the habitat of ovibos; he is at home there, and, unlike the caribou, is not a victim of wander-lust. In this respect he is more like his domestic cousins, remaining indefinitely in areas where food is available. He prefers grass when it is obtainable, but eats as readily lichens, moss, and willow shoots. It is his habit to graze quietly, taking little notice of intruders, and moving when necessary, like cattle. He does not flee from attacks by animals or man, and it is possible to approach quite close before he takes alarm. Even then he will not run far. In one case, after running a little distance from passing travellers, a band, on the second approach of the men, merely looked at them and continued to graze. Thereafter the party passed the band every day and were apparently not noticed, and were certainly not feared.

Ovibos are mild and gentle in disposition except in the rutting season, and then the bulls will take the offensive when the herd is approached. When cows are killed the calves will follow man without any traces of fear.

Explorers, traders, missionaries, and biologists are all of the opinion that there will be no difficulty in domesticating these remarkable animals. They are easily captured and transported, and are quite docile in captivity.

It is the intention of the Dominion government to build up herds on some of the islands in Hudson Bay. Here, with proper protection from the high-power rifles of the Eskimo, and with skilful herding and security from the depredations of wolves, it is expected that they will increase rapidly.

Mr Stefansson claims that the meat of ovibos is practically indistinguishable from beef, and there is much reliable evidence to the effect that it is very nutritious and palatable, and compares favourably with beef, in the opinion of many, being more tender and luscious. The cows give a small quantity of milk of excellent quality. As producers of wool, ovibos are factors to be reckoned with when the experts have succeeded in devising methods of separating the wool from the long hair which runs through it.

In short, the conservation and domestication of the musk-ox are matters of the greatest

importance, and would represent a very important addition to the meat production of the Dominion.

IV.

A glance over the reindeer industry in other countries will enable Canadians to understand that the enormous northern areas which bulk so large on the map will one day be the home of herds of domestic reindeer which should not be less in numbers than the present total of caribou now ranging over that wonderful hinterland.

Time out of mind the reindeer has been of great economic value to the people in the northern parts of Eurasia. The Russian government, however, until awakened by inquiries from America in the early nineties, was not aware of the number or the value of the reindeer within its domain. These animals are indispensable in Siberia and Northern Europe, providing not only food, clothing, and shelter, but excellent transportation as well. They require very little attention; indeed, in reindeer moss, upon which they live entirely, Nature has provided a fodder crop that is inexhaustible.

In Norway and Sweden there are about half a million reindeer, valued at between forty and fifty million dollars. It is only within recent years, in fact during the Great War, that the possibilities of the reindeer meat industry first began to be faintly realised. An excellent market was then developed in those countries for this novel article of diet. As the people became accustomed to its use the price increased steadily with the growing demand until it exceeded that of beef and mutton.

With characteristic enterprise the American government introduced reindeer in Alaska on the suggestion of Dr Sheldon Jackson, General Agent of Education in that territory. In 1890 Dr Jackson found the Alaskan natives in a deplorable condition of poverty, while a few miles across Bering Strait the Siberian Chukchis were rolling in nomadic wealth, enjoying much leisure and remarkably good transportation, all due to their herds of domesticated reindeer.

In the following decade 1080 animals were purchased in Siberia and established in Alaska. The total cost to the United States government in the thirty years following the inception of the project was \$317,000. There are now over 200,000 reindeer in Alaska, valued at over \$5,000,000. The income from the industry during the same period was approximately \$1,750,000. Tens of thousands were killed for meat and shipped out, and an equally large number were required for home consumption. In another quarter-century, at the same rate of increase, there should be between 10,000,000 and 20,000,000 reindeer in Alaska.

The meat was tried in clubs, cafés, and dining-cars, and was found to be an unqualified success. The shipments to Seattle from Nome now

run annually into thousands of carcasses, averaging 150 lb., fetching 28 cents. per lb. f.o.b. Seattle. The Lomen Company, which is the heaviest shipper, owns about 25,000 head of reindeer in the Alaskan territory.

The industry in Norway, Sweden, Russia and Siberia, and the successful development of herds in Alaska suggest that corresponding development may be anticipated in northern Canada.

The wild caribou, which is of the same species, exists in millions—estimates run from twenty to forty million—throughout the Canadian sub-arctics, affording evidence of the suitability of those regions for the maintenance of reindeer herds. During their migrations they are seen in countless numbers scattered over hundreds of miles. 'The buffalo on the plains of long ago would not be a patch on this for numbers,' to quote the words of an old-time inspector of police. Eventually these swarming herds land in the barren grounds, where nobody bothers them.

Sphagnum moss grows in abundance, and is the sole food of the domestic reindeer. Reindeer moss, as it is called—*Cladonia rangiferina*—is grayish-white in its dry state, but has a greenish shade when moist. It derives its nourishment chiefly from the air, greedily absorbing the humidity which makes it swell and become elastic. In a dry condition, however, it is very brittle. It contains flour and gelatin stuff, which make it nourishing to reindeer and cattle.

To begin with, the 1,000,000 square miles of grazing lands are by no means monopolised by the caribou, buffalo, and musk-ox of the present day. Authorities, though chary enough of making forecasts, nevertheless aver that the above-mentioned grazing areas will support from two to three times the number ranging there at present. The wild wood buffalo are almost a negligible quantity, since there are only fifteen hundred near the sixtieth parallel in northern Alberta. Ovíbos on the arctic islands probably number twenty thousand; whereas the caribou, including both the woodland and the barren ground varieties, are believed to number anywhere from twenty to forty million. As time goes on these wild animals will be supplanted by their domesticated descendants, and if these reach the last-named figure they will represent a value running up to a thousand million dollars.

The domestic reindeer and the wild caribou are biologically identical. The latter range over a territory beginning at township Sixty in the prairie provinces and extending to thirty miles from the arctic coast, and from a short distance west of Hudson Bay on the east, to the Alaskan boundary on the west. They are principally of the barren land variety, dressing to about 150 lb. Neither the reindeer nor the caribou seek shelter in extreme weather, as they are perfectly at home in their habitat.

The domestic animal is rather small, weighing from 80 to 300 lb., those used for the trial averaging 100 lb. In reports of school teachers and others in Alaska, who are in charge of herds, appear references to wild male caribou joining the herds in the breeding season and leaving progeny larger and stronger than that from domestic sires. Indeed, the infusion of wild blood really produces magnificent stock fully 100 lb. heavier. There is no reason to doubt that, given proper facilities for restraint, and with intelligent handling, young wild caribou would readily yield to domestication. In Alaska the authorities are now engaged in adding to the weight and stamina of the herds by breeding from wild male caribou. The present herds in that territory, if increased 100 lb. per animal, would have an additional value of \$5,000,000.

Mr Stefansson, in conjunction with the Hudson's Bay Company, has obtained a lease of about half of Baffin Island, where a commercial herd is now being inaugurated. It is to be expected that other interested parties will quickly enter this new field of enterprise. Indeed, one may expect in a very short time a rush to acquire territory. The great fortunes that were piled up in the United States by the meat kings will undoubtedly be duplicated in Canada, unless, of course, the government monopolises the new industry.

A brief survey of the field will convince any one that the north will eventually produce a meat business on a scale that will run into hundreds of millions annually.

Certain islands in Hudson Bay, namely, Southampton, Coats, and Mansell Islands, have been reserved by the authorities as reindeer ranges. The whole of Ungava is well suited for this purpose, as it has an ample supply of suitable vegetation. Reliable people familiar with the arctic coast are unanimous in the opinion that the greater part of the area from Alaska to Kent Peninsula is eminently adapted for the maintenance of reindeer, the vegetation and other conditions being in many ways similar to those which prevail in those parts of Alaska where the reindeer industry has proved most successful.

The attractiveness and palatability of reindeer meat are beyond question. As regards caribou meat, those who know are agreed that it is both nutritious and palatable. At the proper season in the fall and early winter it is excellent, many claiming that it is superior to beef, mutton, and other domestic meats.

In 1908 Dr Grenfell of Labrador fame brought over a herd of 250 reindeer from Lapland to a point near St Anthony's in Newfoundland. In four years the herd increased to 1200. But the financial resources of the mission were not adequate to deal with the matter on a proper scale, and the herd was given to the Canadian government. In 1918 it was located at St

Augustine on the north shore of the Gulf of St Lawrence.

Lapp herders are regarded as indispensable in the early stages, since they take an artistic pride in their skill in herding, training, and general management of reindeer, and, unlike others who have been tried, the Lapp readily adopts suggestions for improvement.

A Chukchi herd in northern Siberia is a sight worth seeing. Here in a glacial valley devoid of trees and shrubs, but tinged with the green of dwarf willows, sedges, and heath-worts, may be seen the skin-covered huts of these primitive plutocrats.

In a typical hut the family consists of father and mother, a red-cheeked girl, and two finely-built boys attired in parka and moccasins—as healthy and rosy and robust a group of children as ever gladdened the heart of Chukchi parents. These lads speed over the ground like trained racers, glorying in their strength.

Of all the tame animals man has gathered about him the reindeer is the tamest. A moving

herd of them coming straight towards you is a sight never to be forgotten—a thicket of antlers, big and little, young and old, led by the strongest, holding their heads low most of the time, as if conscious of the fact that they are carrying big branching horns. The eyes are large, confiding and gentle, with a dreamy expression when the herd is lying down. The limbs are smooth and round. They are trim, delicately moulded animals, with well-poised heads, and beautifully curved antlers—on the whole much finer-looking animals than one expects to see. So tame are they that it is possible to walk in and out among them without disturbing in the slightest their expression of the profoundest comfort.

It is obvious from the foregoing that Canada has a number of highly practical problems to solve, some of which, like the projects just sketched in their main outlines, may with a comparatively small expenditure be brought to the stage where they will add considerably to the national wealth.

THE RISE OF THE SCALE INDUSTRY.

By 'STATERA.'

IN the general interest taken in the development of modern industries a curious neglect is sometimes shown towards certain trades which are essential to the other better known ones, and yet whose products are so familiar to everyone and so widespread that they get overlooked. The old adage about familiarity breeding contempt can be aptly applied to such trades. To this category the industry connected with the manufacture of weighing apparatus belongs, and it has suffered not a little from this oversight in popular knowledge, probably owing to the total absence of spectacular attractions, such as are furnished by the products of other industries—for instance, the blast furnace and the locomotive.

One need only pause to consider how important in every branch of material human activity is the ascertainment of weight, and the key position of the industry will be realised. In the household, as in the largest factory, weights are vital factors. The decision of the thrifty housewife as to the best way of laying out her available housekeeping money and the enterprises of the captains of industry depend equally on weight. Sir William Petty, the 'Father of Statistics,' stated in the seventeenth century that he aimed at expressing himself in terms of 'number, weight, or measure.' Of these three categories weight is by far the most important, and is at the same time intimately connected with the other two. In fact, the ascertaining of weight and number is to-day in some industries carried out by one machine, which weighs and counts simultaneously.

To the average person the term 'weighing apparatus' or 'weighing machine' brings to mind a pair of scales or a steelyard. These are the forms with which he is brought into daily contact—an equal-armed beam with pans suspended from it, or a steelyard with a movable weight, together with the ordinary scale with two pans above the beam seen on tens of thousands of shop counters. This last type is of recent origin, but the others can claim an unbroken, universal, and unchanged descent not rivalled by Tut-ankh-Amen himself. On old Egyptian paintings we see beam scales similar to those in use to-day. It is recorded of Abraham that he weighed out 400 shekels of silver for the cave of Macpelah, and the famous phrase, *Væ victis!* originated in a transaction connected with the weighing out of bullion, in all probability on a beam scale. The steelyard was in use in the great days of Rome, and is known as the Roman steelyard to distinguish it from later types. The French word 'romaine,' and the Spanish 'romana' are indicative of its origin. The museums, such as the Guildhall Museum, contain specimens which are almost identical with the modern article.

Until the eve of the industrial revolution these two types, the beam and the steelyard, remained predominant, and were the only instruments on which weights could be obtained for all purposes. Like other implements of industry, the weighing 'machine' was radically changed through the effects of that great series of events which introduced the industrial era.

It is worth while considering briefly why these old types should have maintained their supremacy for such a length of time. Before the eighteenth century, industry, as it is understood to-day, did not exist. All manufacture was organised on an individual basis, and the dimensions of the product of any trade were no larger in the United Kingdom in, say, the sixteenth century than in the days of the Roman Empire. Manual work was the fundamental and determining factor in both ages, and manual work has its limits rigidly fixed by the human anatomy. It required no more complicated apparatus to weigh the product of the land and the loom in Elizabethan England than in Imperial Rome. One thing is certain, that no man can be credited with the discovery or invention of the balance. It is one of those products of man's ingenuity whose origin lies behind the mists of antiquity.

The industrial revolution did not miss the weighing 'machine.' In spite of its respectable antiquity the inventive spirit extended even to it, and completely new forms were introduced. The old types were no longer sufficient for the needs of industry, which was multiplying the size both of individual businesses and their products. The modern iron age was presenting man with bigger products than ever before, and these had to be weighed. The importance of the time factor in trade began to make itself felt with steam power, and the old methods were inadequate for the demands now being made on them.

In the second half of the eighteenth century the principle of compound levers was applied to weighing, and the first modern weighing-machine proper came into existence. By means of a platform supported on knife-edges in levers which transferred the pressure of the load to a beam on which was a movable weight or weights waggons and large and heavy objects could be weighed speedily, and without the inconvenience of unloading and using quantities of heavy weights. At first constructed partly of wood and partly of wrought iron, the development of the heavy iron industry led to the new machines being made of cast iron, which could carry the heavier loads of the rapidly-increasing industries. The same principle of compound levers was applied to smaller loads in shops and warehouses, the 'platform' scale was evolved, and the even-armed beam scale became the exception rather than the rule. The discovery of a method of supporting pans above the beam, which was introduced in the eighteenth century (although known in the seventeenth century), and which has given us the familiar shop scale, helped further in rendering the old types obsolete.

The advent of the railroad introduced another factor—ability to stand up to the heavy wear and tear caused by steam-propelled vehicles of greater weight and size than any previously-

known means of transport. The new machines had been developed sufficiently by the time that the railways had become commercial propositions, and the railway industry is now the largest single user of weighing-machines in the country. This great industry depends on the efficiency of its weighing-machines for its own business success. One has only to look at the statistics of transport, both land and sea, to realise the importance to it of reliable weighing-machines.

The weighing-machine industry is not in the true sense of the word a pioneer industry. It does not open up new fields of advantage like the transport and metallurgical industries. It is, however, so intimately related to these that it must keep abreast of the demands made on it for still more efficient and rapid means of ascertaining weight. Should it not do so, a 'bottle-neck' may be created which will check the development of other trades in their efforts to improve methods of organisation. In keeping step in the industrial march of progress it has changed its organisation entirely. Formerly it was in the hands of skilled craftsmen working for themselves and scattered over the country. When the demand arose for heavier and larger machines, the factory system of production was applied to it, and the making of weighing-machines became a section of general engineering.

Owing to the skilled nature of the workmanship required to produce a finished weighing-machine, the craftsman could not be displaced entirely by semi-skilled labour aided by machinery; and this is still true in a lesser degree, although it is a far cry from the crude productions of the early days of engineering to the accurate machine-work of the present day.

This development led to the gradual concentration of the industry in the hands of a few firms, in whose factories the cumulative skill of generations of these workers was assembled. The vast majority of all weighing devices in use in this country are produced by a small number of firms, the names of one or two being almost household words. The largest of them employs thousands of workers in its establishments, and has a history covering 200 years.

This concentration of skill and resources has enabled the weighing-machine industry to keep pace with the demands made on it by the other industries. Towards the end of the nineteenth century new methods of handling the huge quantities of raw materials liberated by the mechanical inventions were introduced, and these in their turn enabled the output of these materials to be still further increased. The grain supplies from America and Russia, and the increased coal output, provide good examples. Most staple commodities go by weight, especially those which can be graded. The production of weighing-machines to weigh automatically, continuously, and rapidly was tackled and attained successfully. The most thorough application of

these machines has been made in the United States, but they are in general use in all industrial countries.

The latest development has been the application of the automatic and time-saving scale to the retail trades, a sphere in which the old types had remained supreme, with the addition of the well-known shop scale, introduced about the same time as the compound lever weighing-machine. The new method was first adopted in the United States, where it is the general practice. The rapidly extending use of the automatic scale, which shows the exact weight on a dial or chart, has made it a familiar object to every one. It is undoubtedly in this direction that the future evolution of the weighing-machine is to be looked for.

The industry occupies a position apart from the other metal and engineering industries on account of the peculiar relations between it, through its products, and the general public, through the state. From the earliest days of organised communities, governments have considered it their duty to supervise the standards of weight and measure. The Law of Moses is strict on this point, and the accusation of giving false weight was made by the Prophets at a later date in the history of the Jews. In our own country particular attention was given in the Middle Ages to the accuracy of weights used in trade, as is exemplified by the various 'Assizes.' Unfortunately attention was paid only to the weights themselves, the scale or balance being apparently considered of minor importance. With the widening sphere of governmental activity and interference in commercial life more attention was paid to the control of weights and measures in the nineteenth century, but it is an interesting fact that

weighing instruments and machines were not brought properly under state control by legislation till late in last century. Even now, although the most important part of the inspector's work is the supervision of weighing-machines, he is still designated 'Inspector of Weights and Measures.'

By means of this quasi-public control the weighing-machine industry enjoys a variety of 'protection' against cheap, shoddy productions both at home and from abroad. Owing to the necessity for all weighing apparatus for trade use to pass certain tests of accuracy, machines made abroad in countries with different regulations are less likely to prove serious competitors of the home-manufactured article, and at home this control ensures that the latter shall be reasonably good.

Divergent opinions exist as to the best method of organising state control, and the problem has yet to be settled. The present system is a good example of the British method of compromise. The local authorities exercise the supervision of weights and measures through their inspectors, subject to a rather undefined control by the Board of Trade, which issues the regulations to be followed by these inspectors. The general trend seems to be in favour of a centralised organisation which will avoid inequalities such as exist to-day in different parts of the country. The present system, in spite of weaknesses, combined with the efficiency of the manufacturers, is sufficient to provide this country with the most reliable and accurate instruments for weighing that can be found in any part of the world. The excellence of the British product is substantiated by the favour which it finds in overseas markets where reliability is a fundamental requirement.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER VI.—THE RETURN OF HARALD BLACKTOOTH.

MISS JANET RADEN had a taste for the dramatic, which that night was nobly gratified. The space in front of the great door of the Castle became a stage, of which the sole furniture was the body of a deceased stag, but on which event succeeded event with a speed which recalled the cinema rather than the legitimate drama.

First, about six o'clock, entered Agatha and Junius Bandicott from their casual wardenship of Carnbeg. The effect upon the young man was surprising. Hitherto he had only half believed in John Macnab, and had regarded the defence of Glenraden as more or less of a joke. It seemed to him inconceivable that, even with the slender staffing of the forest, one man could enter and slay and recover a deer. But when he heard Janet's tale he became

visibly excited, his careful and precise English, the bequest of his New England birth, breaking down into college slang.

'The man's a crackerjack,' he murmured reverently. 'He has us all rocketing around the mountain tops, and then takes advantage of my dad's blasting operations and raids the front yard. He can pull the slick stuff all right, and we at Strathlarrig had better get cold towels round our heads and do some thinking. Our time's getting short, too, for he starts at midnight the day after to-morrow.—What did you say the fellow was like, Miss Janet? Young, and big, and behaved like a gentleman? It's a tougher proposition than I thought, and I'm going home right now to put old Angus through his catechism.'

With a deeply preoccupied face Junius, de-

clining tea, fetched his car from the stableyard and took his leave.

At seven-fifteen Colonel Raden, bestriding a deer pony, emerged from the beech avenue, and waved a cheerful hand to his daughters. 'It's all right, my dears. Not a sign of the blackguard. The men will remain on Carnmore till midnight, to be perfectly safe, but I'm inclined to think that the whole thing is a fiasco. He has been frightened away by our precautions. But it's been a jolly day on the high tops, and I have the thirst of all creation.'

Then his eye fell on the stag. 'God bless my soul!' he cried. 'What is that?'

'That,' said Janet, 'is the stag which John Macnab killed this afternoon.'

The colonel promptly fell off his pony. 'Where—where?' he stammered.

'On the Home beat,' said Janet calmly. The situation was going to be quite as dramatic as she had hoped. 'I saw it fall, and ran hard and got up to it just when he was starting the gralloch. He was really quite nice about it.'

'What did he do?' her parent demanded.

'He held up his hands and laughed, and cried, "Kamerad!" Then he ran away.'

'The scoundrel showed a proper sense of shame.'

'I don't think he was ashamed. Why should he be, for we accepted his challenge? You know he's a gentleman, papa, and quite young and good-looking.'

Colonel Raden's mind was passing through swift stages from exasperation to unwilling respect. It was an infernal annoyance that John Macnab should have been suffered to intrude on the sacred soil of Glenraden, but the man had played the boldest kind of hand, and he had certainly not tailored his beast. Besides, he had been beaten, beaten by a girl, a daughter of the house. The honour of Glenraden might be considered sacrosanct after all.

A long drink restored the colonel's equanimity, and the thought of their careful preparations expended in the void moved him to laughter. 'Pon my word, Nettie, I should like to ask the fellow to dinner. I wonder where on earth he is living. He can't be far off, for he is due at Strathlarrig very soon. When did young Bandicott say the day was?'

'The day after to-morrow. Mr Junius feels very solemn after to-day, and has hurried home to put his house in order.'

'Nettie,' said the colonel gravely, 'I am prepared to make a modest bet that John Macnab gets his salmon. Hang it all, if he could outwit us—and he did it, confound him!—he is bound to outwit the Bandicotts. I tell you what, John Macnab is a very remarkable man—a man in a million—and I'm very much inclined to wish him success.'

'So am I,' said Janet, but Agatha announced

indignantly that she had never met a case of grosser selfishness. She announced, too, that she was prepared to join in the guarding of Strathlarrig.

'If you and Junius are no more use than you were on Carnbeg to-day, John Macnab needn't worry,' said Janet sweetly.

Agatha was about to retort, when there was a sudden diversion. The elder Bandicott appeared at a pace which was almost a run, breathing hard, and with all the appearance of strong excitement. Fifty yards behind him could be seen the two Strathlarrig labourers, making the best speed they could under the burden of heavy sacks. Mr Bandicott had no breath left to speak, but he motioned to his audience to give him time and permit his henchmen to arrive. These henchmen he directed to the lawn, where they dropped their sacks on the grass. Then, with an air which was almost sacramental, he turned to Colonel Raden. 'Sir,' he said, 'you are privileged—we are privileged—to assist in the greatest triumph of modern archæology. I have found the coffin of Harald Blacktooth, with the dust of Harald Blacktooth inside it.'

'The devil you have!' said the colonel. 'I suppose I ought to congratulate you, but I'm bound to say I'm rather sorry. I feel as if I had violated the tomb of my ancestors.'

'You need have no fear, sir. The dust has been reverently restored to its casket, and to-morrow the Piper's Ring will show no trace of the work. But within the stone casket there were articles which in the name of science I have taken the liberty to bring with me, and which will awake an interest among the learned, not less, I am convinced, than Schliemann's discoveries at Mycenæ. I have found, sir, incredible treasures.'

'Treasures!' cried all three of his auditors, for the word has not lost its ancient magic.

Mr Bandicott, with the air of one addressing the Smithsonian Institute, signalled to his henchmen, who thereupon emptied the sacks on the lawn. A curious jumble of objects lay scattered under the evening sun—two massive torques, several bowls and flagons, spear heads from which the hafts had long since rotted, a sword-blade, and a quantity of brooches, armlets, and rings. A dingy enough collection they made to the eyes of the onlookers, as Mr Bandicott arranged them in two heaps. 'These,' he said, pointing to the torques, armlets, and flagons, 'are, so far as I can judge, of solid gold.'

The colonel called upon his Maker to sanctify his soul. 'Gold! Those great things! They must be prodigiously valuable. Are they mine, or yours, or whose?'

'I am not familiar with the law of Scotland on the matter of treasure trove, but I assume that the State can annex them, paying you a percentage of their value. For myself, I gladly

waive all claims. I am a man of science, sir, not a treasure-hunter. . . . But the merit of the discovery does not lie in those objects, which can be paralleled from many tombs in Scotland and Norway. No, sir, the tremendous, the epoch-making value is to be found in these.' And he indicated some bracelets and a necklace which looked as if they were made of queerly-marked and very dirty shells.

Mr Bandicott lifted one and fingered it lovingly. 'I have found such objects in graves as far apart as the coast of Labrador and the coast of Rhode Island, and as far inland as the Ohio basin. These shells were the common funerary adjunct of the primitive inhabitants of my country, and they are peculiar to the North American continent. Do you see what follows, sir?'

The colonel did not; and Mr Bandicott, his voice thrilling with emotion, continued: 'It follows that Harald Blacktooth obtained them from the only place he could obtain them, the other side of the Atlantic. There is historical warrant for believing that he voyaged to Greenland; and now we know that he landed upon the main North American continent. The legends of Eric the Red and Leif the Lucky are now verified by archæology. In you, sir, I salute, most reverently salute, the representative of a family to whom belongs the credit hitherto given to Columbus.'

Colonel Raden plucked feebly at his moustache, and Janet, I regret to say, laughed. But her untimely merriment was checked by Mr Bandicott, who was pronouncing a sort of benediction.

'I rejoice that it has been given to me, an American, to solve this secular riddle. When I think that the dust which an hour ago I touched, and which has lain for fifteen centuries under that quiet mound, was once the man who, first of Europeans, trod our soil, my imagination staggers. Colonel Raden, I thank you for having given me the greatest moment of my not uneventful life.'

He took off his hat, and the colonel rather shamefacedly removed his. The two men stood looking solemnly at each other till practical considerations occurred to the descendant of the Viking.

'What are you going to go with the loot?' he asked.

'With your permission I will take it to Strathlarrig, where I can examine and catalogue it at my leisure. I propose to announce the find at once to the world. To-morrow I will return with my men and remove the traces of our excavation.'

Mr Bandicott departed in his car, sitting erect at the wheel in a strangely priest-like attitude, while the two men guarded the treasure behind. He had no eyes for the twilight landscape, or he would have seen in the canal-like stretch of the

Larrig belonging to Crask, which lay below the rapids, and was universally condemned as hopeless for fish, a solitary angler, who, as the car passed, made a most bungling amateurish cast, but who, when the coast was once more clear, flung a line of surprising delicacy. He could not see the curious way in which that angler placed his fly, laying it with a curl a yard above a moving fish, floating it dry till after it had passed the fish, and then sinking it with a dexterous twist; nor did he see a quarter of an hour later the same angler land a fair salmon from water in which in the memory of man no salmon had ever been taken before.

Colonel Raden and his daughters stood watching the departing archæologist, and as his car vanished among the beeches, Janet seized her sister and whirled her into a dance. 'Such a day,' she cried when the indignant Agatha had escaped and was patting her disordered hair. 'Losses—one stag, which was better dead. Gains—defeat of John Macnab, fifty pounds sterling, a share of unknown value in Harald Blacktooth's treasure, and the annexation of America by the Raden family.'

'You'd better say that America has annexed us,' said the still flustered Agatha. 'They've dug up our barrow, and this afternoon Junius Bandicott asked me to marry him.'

Janet stopped in her tracks. 'What did you say?'

'I said "No," of course. I've only known him a week.' But her tone was such as to make her sister fear the worst.

Mr Bandicott was an archæologist, but he was also a business man, and he was disposed to use the whole apparatus of civilisation to announce his discovery to the world. With a good deal of trouble he got the two chief Scottish newspapers on the telephone, and dictated to them a summary of his story. He asked them to pass the matter on to the London press, and he gave them ample references to establish his good faith. Also he prepared a sheaf of telegrams and cables—to learned societies in Britain and America, to the great New York daily of which he was the principal owner, to the British Museum, to the Secretary for Scotland, and to friends in the same line of scholarship. Having left instructions that these messages should be dispatched from Inverlarrig at dawn, he went to bed in a state of profound jubilation and utter fatigue.

Next morning, while his father was absorbed in the remains of Harald Blacktooth, Junius summoned a council of war. To it there came Angus, the head-keeper, a morose old man nearly six foot four in height, clean-shaven, with eyebrows like a pent-house; Lennox, his second-in-command, whom Leithen had met in his reconnaissance; and two youthful watchers, late of Lovat's Scouts, known as Jimsie and

Davie. There were others about the place who could be mobilised if necessary, including the two chauffeurs, an under-footman and a valet, but as Junius looked at his formidable quartet, and reflected on the narrow limits of the area of danger, he concluded that he had all the manpower he needed.

'Now, listen to me, Angus,' he began. 'This poacher Macnab proposes to start to-morrow night at twelve o'clock, and according to his challenge he has forty-eight hours to get a fish in—up till midnight on September the third. I want your advice about the best way of check-mating him. You've attended to my orders and let nobody near the river during the past week?

'Ay, sir, and there's nobody has socht to gang near it,' said Angus. 'The countryside has been as quiet as a grave.'

'Well, it won't be after to-morrow night. You've probably heard that this Macnab killed a stag on Glenraden yesterday—killed it within half a mile of the house, and would have got away with it but for the younger Miss Raden.'

They had heard of it, for the Glen had talked of nothing else all night, but they thought it good manners to express amazement. 'Heard ye ever the like?' said one. 'Macnab maun be a fair deevil,' said another. 'If I had just a grip of him!' sighed the blood-thirsty Angus.

'It's clear we're up against something quite out of the common,' Junius went on, 'and we daren't give him the faintest outside chance. Now, let's consider the river. You say you've seen nobody near it.'

'There hasn't been a line cast in the watter forby your own, sir,' said Angus.

'I just seen the one man fishin' a' week,' volunteered Jimsie. 'It was on the Crask watter below the brig. I jaloused that he was one of the servants from Crask, and maybe no' very right in the heid. He had no notion of it at all, at all.'

'Well, that's so far good. Now, what about the river outside the park? Our beat runs from the Larrig bridge—what's it like between the bridge and the lodge? You've never taken me fishing there.'

'Ye wad need to be dementit before you went fishin' there,' said Angus grimly. 'There's the stretch above the brig that they ca' the Lang Whang. There was never man killed a saumon in it, for the fish dinna bide, but rin through to the Wood Pule. There's fish in the Wood Pule, but the trees are that thick that ye canna cast a flee. Though I'll no' say—' he added meditatively, 'that ye couldna cleek a fish out of it. I'd better put a watcher at the Wood Pule.'

'You may rule that out, for the bargain says "legitimate means," and from all I know of Macnab he's a sportsman and keeps his word. Well, then, we come to the park, where we've

the five pools—The Duke's, the Black Scour, Davie's Pot, Lady Maisie's, and The Minister's. We've got to keep our eyes skinned there . . . What about the upper water?'

'There's no fish in it,' said Lennox. 'They canna get past the linn above The Minister's. There was aye talk o' makin' a salmon ladder, but naething was done, and there's nocht above The Minister's but small broun trout.'

'That makes it a pretty simple proposition,' said Junius. 'We've got just the five pools to guard. For the form of the thing we'll keep watchers on all night, but we may take it that the danger lies only in the thirty-four hours of daylight. Now, remember, we're taking no chances. Not a soul is to be allowed to fish on the Strathlarrig water till after midnight on September the third. Not even I or my father. Macnab's a foxy fellow, and I wouldn't put it past him to disguise himself as Mr Bandicott or myself. Do you understand? If you see a man near the river, kick him out. If he has a rod in his hand, lock him up in the garage and send for me. . . . No, better still. Nobody's to be allowed inside the gates—except Colonel Raden and his daughters. You'd better tell the lodge-keeper, Angus. If anybody comes to call, they must come back another day. These are my orders, you understand, and I fire any one who disobeys them. If the third of September passes without accident there's twenty dollars—I mean to say, five pounds—for each of you. That's all I've got to say.'

'Will we watch below the park, sir?' Angus asked.

'Watch every damned foot of the water from the bridge to the linn.'

Thus it came about that that day, when Janet Raden took her afternoon ride past the Wood of Larrimore, she beheld a man patrolling the bog like a policeman on duty, and when she entered the park for a gallop on the smooth turf she observed a picket at each pool. 'Poor John Macnab!' she sighed; 'he hasn't the ghost of a chance. I'm rather sorry my family ever discovered America.'

(Continued on page 182.)

SONNET.

BELOVED, who dost lavish still thy store
Of most rich love and presence ev'n on me,
What wonder if, love's pauper, now I be
Love's miser, and each day into the sure
Fond secret coffers of remembrance pour
The fancied silver seconds ruefully,
Or the great golden hours with such a glee
As rises in my heart, but may no more?

Yea, I am poor, whose proper affluence is
Mere coin of dreams and faith and will; and this
Wide want of mine is now become so deep,
Thy love supplies my dire deficiencies
Only by filling up the untold abyss
And heaping high thereon the precious heap.

SEVENTH SERIES

IN THE VALLEY.

By CHARLES SIDDLE.

I.

GRIMSDON pushed his hair up from the front of his eyes with a filthy hand, and tried to moisten his dry lips with the end of a swollen tongue. Lord! if he could only get a drink! Oh! if the sun would go down on this endless day. He was getting light-headed, and out there, down the ravine, those blasted police-troopers were waiting, waiting, patient as Judgment Day—and as certain to get him in the end. Well—the sooner the better, now. He had sent two of them to glory, anyway; and before he went himself he'd put another two or three of 'em to sleep. Maybe they'd got Bill Grimsdon where they wanted him at last, but by gee! they'd have to pay for their seats at the final show-down, and no movie stunt at that. No! He laughed harshly. No darned movie man to see that the villain's gun missed fire and the heroes escaped unhurt. Not in this show. And they'd have to come and take him.

That was the cream of the jest. The last two they sent for him had found the job too much for them, and now these two were skulking down there, afraid to come on. But they'd have to, before night. With the first cover of night he'd be off, and they knew it. And here he was, behind his rock, and there they were, somewhere down there, under cover. And between them a hundred yards of bare valley without cover for a rabbit; and behind him, curse it, a stretch of three hundred yards of the same. The little rock where he crouched was the only cover in all that waste—and he was full in the blaze of the sun. A fair show-down, with all the cards in the other hand, except one. Except one, and that was the joker. They had to come for him before dark!

A rifle spoke, down the valley, and a piece of rock, chipped off by the bullet, flew past his ear. He replied automatically, firing at the flash—more to let them know he was watching than from any hope of doing damage. He had plenty of ammunition, and he could wait. But they couldn't. Not too long, or he'd be away again. And by God! he might do it yet. Barring the chance of a lucky shot, they couldn't get him without coming for him, and he reckoned on

getting them before they crossed that patch—with luck he ought to get 'em both. And they knew it. Well, it was their move, anyway.

II.

Corporal Berry was worried. His orders were to bring Grimsdon in, and he meant to do it. He knew Inspector Gordon well enough to anticipate his reception if he went back minus his man and explained that the fellow held him at bay all day in this God-forsaken valley and slipped away at night. He talked it over with Manning. 'I've half a mind to let him break away when it gets dark,' he said, 'and run the risk of losing him. We might nip him some other time when the conditions are not so darned expensive.'

Manning replied without lifting his head or taking his eyes from that solitary splash of cover up the valley. 'He's a slippery cuss, corporal,' he said; 'and he got Graham and Bevan. We owe him one for that.'

Berry frowned, perplexed. 'I know,' he said. 'But confound it, Manning, there isn't cover for a coney, and his guns are right on the spot.' He looked up at the walls of the valley—sheer towering masses of smooth rock: 'And there's no way of flanking him, short of going seventy miles.'

Manning nodded, and spat calmly. 'Well, I guess it's gotta be done, corp.,' he said. 'Mebbe we'll get it in the neck, but we gotta try. That's right, ain't it? We just got to.'

'Ay—we've just got to,' said Berry gloomily. He was in charge, and he meant to get Grimsdon. A long record in the Mounted cleared him of the remotest suspicion of cowardice—but he couldn't help seeing that to advance up that valley in full day-light was suicide. The only chance was to wait for the tricky light which followed sundown. Maybe Grimsdon wouldn't see so well, or aim so true. Of course it cut the other way as well, but—

The sound of hooves on the rock behind the turn in the valley was an amazing interruption. 'Hang on there, Manning—watch him—I'll see what the tarnation this is,' Berry whispered, and slid away, keeping carefully under cover until the wall of rock hid him from Grimsdon's guns. Then he stood up and gaped in absolute amaze-

ment at what he saw. In this remote mountain valley, nothing was more unlikely than an eruption of tourists—but that was what it looked like. Picking their way up the valley came two tired horses and a pack-mule. On the foremost horse was an obvious guide; on the other was a more than obvious Easterner—if not an Englishman.

'Now, what the blazes!' said Berry explosively, and hurried down to meet them. 'You better get out of this, pretty damn quick,' he shouted, when he got within hail. 'This place isn't healthy for strangers.'

The foremost rider stopped. 'Guess you'd better talk to Alphonso,' he said, jerking his thumb over his shoulder. 'It's his funeral, red jacket, not mine.'

The very remarkable figure in the complete hunting outfit of an enterprising London tailor slid stiffly from the saddle and stretched his limbs with irrepressible groans of anguish. Even in the midst of his worry, Corporal Berry was compelled to smile. The man was such a perfect example of his kind. Fitted out with a complete set of backwoods paraphernalia, supplied with a horse and a guide, here he was, suffering agonies from saddle-soreness and the penalties of soft living. He spoke, and Berry's suspicion that he was English was confirmed. 'Am I addressing Corporal Berry of the Royal Canadian Mounted Police?' he asked.

'You are,' said Berry.

'Then permit me to present a letter from Inspector Gordon, containing my credentials; and when you have read it, I will, with your permission, explain my no doubt unexpected intrusion. But first—you'll pardon my anxiety—you haven't—Grimsdon isn't dead yet?'

Berry stared at him open-mouthed. 'No—but I wish to God he was,' he said.

'Ah!' The man's relief was evident. 'Please read the letter.'

Still gaping at the amazing stranger, Berry broke the seal and opened his letter. Then at last he dragged his eyes from the hopeless task of piercing the mystery, and read what his chief had to say:

'DEAR BERRY,—The bearer of this is a Mr Jonathan Grimsdon. He is a brother of the man you are after; but far from being the same kind. There is no doubt of his credentials. I have had them thoroughly tested. He has been the valet, or something like that, of Lord Osmanthorpe, the Colonial Secretary, for thirty years, and we are to give him all the assistance in our power.

'This is not an official note. The whole thing is deuced irregular, and I'm not going to interfere with your discretion. You are to get your man, and that's all the official orders you will receive. But if you can do anything for the other Grimsdon without danger to your job—

mind that, Berry—without danger to your job, you can do so. He has big influences behind him, and we don't want to upset him if we can help it. But first of all—get your man.

'I nearly came up with him—I know he'll introduce complications—but I can't get away. So do your best not to be too hard on him, and—get your man. THOMAS GORDON.'

Berry read the note twice, and then looked at the bearer, with even more bewilderment than before. 'You—you are Grimsdon's brother?' he gasped.

Jonathan Grimsdon nodded, with down-cast eyes. 'Unfortunately, William is my brother,' he said. 'It has been a great grief to us, corporal. A great grief!'

'I should think so,' said Berry dryly. 'He's a real wrong 'un, is Bill. Wanted for three murders, and Lord knows how many other things. And now he's added two good troopers to his bag, and is lying in there waiting for a chance to get some more.'

Jonathan groaned. 'Oh, terrible!' he said. 'Terrible! How my dear mother came to bear such a child is a mystery no amount of thought can solve. A better woman never lived, corporal, and she died with a message of forgiveness and love on her lips.'

Corporal Berry shuffled uneasily. Himself, he was not feeling like discussing sympathy and love for Bill Grimsdon.

'That is why I am here,' said Jonathan calmly, speaking as if it were the most reasonable thing in the world. 'I accepted a sacred trust—to find my brother and carry that message to him. I swore that nothing but death should prevent its reaching him. And here I am.'

Berry was not a callous man, but this was rather too much for him to swallow. 'Oh, come off it,' he said. 'You are not going to tell me that's all you want here?'

Jonathan opened his eyes with simple surprise. 'But isn't that enough?' he said. 'A mother's dying command?'

'But, my dear fellow,' said Berry, 'don't you understand that this precious brother of yours is lying up there behind a gun waiting for the last hand—that he has killed until he doesn't give a damn how many more he adds to his account—and that any time now I may be one of his victims myself? This is no Sunday-school picnic, and I'd advise you to get out while the going's good. There'll be hell to pay in this valley before dark. The only thing we are waiting for is sundown and a tricky light. It might give us a sporting chance. Bad shooting light.'

'Nevertheless,' said Jonathan stubbornly, 'I must go to him first and tell him.'

'Cut that right out,' said Berry. 'I'm having no monkey tricks here. You may be all right,

but no one's going up that valley unless I go with him. Get that?'

Jonathan Grimsdon smiled calmly. 'I've come four thousand miles to deliver a message,' he said, 'and shall a hundred yards from my goal see the abandonment of my quest? Listen, corporal. I promise——'

They talked there for a very long time.

III.

Bill Grimsdon was becoming uneasy. They were very quiet down there. Much too quiet. Not likely they were going to leave him alone till dark with the idea of catching him on the run. Not likely! They knew him too well for that. Good enough men in their way, but Berry had tried a game of hide-and-seek with Bill Grimsdon too often in these hills to want to try another. But anyway, what the devil were they waiting for? Didn't think he'd go to sleep?

He emptied the magazine of one gun rapidly, firing at the rocks. There was nothing else to be seen. And then silence. Why didn't they reply? Trying to kid him into showing himself, were they? Think he was a kid, by gee? Or perhaps one of them was riding round by Blue Valley, hoping to cut him off? Not likely! Seventy miles of bad going before they circled round to the top end of this valley. Berry knew the game too well to try that card. No; they were down there somewhere. He kept a sharp look-out and waited. But he was uneasy. It looked as if they had a new card out there; and he had no guess whether it was a dud or a joker.

Some one moved down there, and Bill fired with the automatic rapidity of reflex action. Not a shot replied. He waited, puzzled to the pitch of acute anxiety, and then a handkerchief shot up on the end of a stick, and waved slowly about in the breeze. For a full half minute it remained there, and then a man stood up, boldly, and walked forward, carrying the improvised white flag.

This was just idiocy. Didn't the fools know he was too desperate to risk any chin-wagging? What in God's name did they think he could talk about? His end was certain; there were no terms for him to make. And if they thought he cared about their darned white flag. . . . He aimed carefully at the advancing enemy, and his finger quivered on the trigger. Then the gun fell to the ground, and he sat back, breathless. In the minute focus of the back-sight he had recognised that it was no police trooper who threw his life so recklessly on the hazard of a white flag. It was Jonathan—of all men the least expected! After a moment he stood up, fearless of police rifles now. A white flag meant nothing to him, but those fools down there would respect it. He was glad of the chance to stretch his limbs. But Jonathan—the whitest lamb of the flock—here on this day just in time

for the final curtain. If that didn't beat the band! He sat down on his rock and rolled a cigarette.

'Well, my sorrowing brother,' he said, when Jonathan came within reach, 'how's the upper servants' hall getting on without you?'

'William, this is a sad day for any one who cares for you,' said Jonathan gloomily. 'A sad day—and a sad end to a life so full of promise as yours was once.'

'Now, I call that real friendly of you, Jonathan,' said Bill, 'to come along this way to cheer me up; it was a kind thought. But then you always were kind, Jonathan—especially to pretty parlour-maids!'

Jonathan flushed deeply. 'This frivolity is out of place,' he said heavily. 'Remember, William, you are, as it were, on your death-bed. Listen. I have a message for you, and a question to ask. Our mother——'

IV.

Corporal Berry watched the distant figures of the two brothers with gloomy intensity. How on earth he ever came to allow that ridiculous Jonathan fellow to over-persuade him? The man had a tongue like greased leather. Talk! He'd talk a woman off her feet. And there he was, pow-wowing with Bill Grimsdon. Lord knows what about. And if anything happened, Inspector Gordon would just about take Berry's wig off—although he'd practically written orders to let the Jonathan man have his own way. But, of course, that wouldn't be anything. If aught happened, it hadn't been orders. That was the way of it. A man got no mercy for a mistake. Some day, somewhere, one of them had to get Bill Grimsdon. That was the law and the prophets. But this Jonathan man—this fool from England—Berry couldn't place him. And he was worried.

Easy to take a pot-shot at Grimsdon now as he sat there talking. And why not? The fellow was an out-and-out wrong 'un, and ten to one he'd get a few more good fellows before he was laid out. Berry looked round at Manning, standing about clear of cover now. It must be right to save the life of such a grand fellow. His fingers twitched on his rifle, but he didn't raise it. Confound it! Treacherous murdering dog though he was, Grimsdon was going to get fair play from the force. They'd get him, but they'd get him fair.

'Time that fellow was coming back,' said Manning. 'Sun'll be down inside an hour.'

Berry nodded. 'Yes,' he said; 'I'll give him another ten minutes, then I'll signal him. Can't have him hanging around too long.'

Manning grunted. 'You swallow that yarn about dying mothers, and all that?' he asked.

Berry laughed. 'Not me,' he said. 'But the chap has some big 'uns behind him, and whatever he's after he meant to get it. If anything goes

wrong I'll get it in the neck for letting him go up there,' he nodded up the valley; 'but if I hadn't I reckon I'd have caught it worse.'

'That's so,' said Manning calmly, as one accepting the follies of a well-loved organisation; 'but I'd like to know what his game really is.'

'So would I,' said Berry. 'I know one thing: if he wants to do it on Bill Grimsdon, he's got some job on.'

'That's so,' said Manning again.

They stood silent, looking up the valley at the two men, who were almost as unlike as brothers could be. And then Jonathan Grimsdon left his brother and walked quickly back towards the waiting troopers, while Bill Grimsdon, calmly secure, sat on his rock, a fair target, and waited.

v.

Berry looked down at Bill Grimsdon as he sat smoking a cigarette and idly kicking his heels in the sun. This, then, was the end of the long chase. Surrender on terms. Well, he was jolly glad to be rid of that last charge up the valley. Jolly glad!

'Come on, now, Grimsdon,' he said. 'Spit it out; what's the big idea? You know I can't do much for you. Short shrift and a quick death—that's about the mark.'

Bill Grimsdon laughed. 'Sure,' he said. 'I'm not asking you for anything, Berry. We've had a long tussle, you and me, and I guess I know when the game's up. What I want you up here for is to listen to a little yarn before we go.'

Berry stood stiffly, his hand on his gun. He had left Manning down there in response to Bill Grimsdon's message—but he was not running any unnecessary risk. Bill was a tough card, and not above finessing a trick. As for this Jonathan fellow—well, he wasn't explained yet, not by a long chalk. So Corporal Berry stood and kept his hand on his gun. And Jonathan Grimsdon stood, too—but he didn't carry a gun. As for Bill Grimsdon, he sat on his rock and smoked cigarettes, his guns lying beside him on the ground.

'Spit it out,' said Berry. 'I've no time to waste.'

Bill Grimsdon pushed his hands into his pockets. 'I won't keep you,' he said. 'The yarn tells itself in quick time. I don't suppose you swallowed brother Jonathan's yarn about dying messages, Berry?'

Berry shook his head. 'Not me,' he said. 'But it was good enough for publication.'

Grimsdon nodded. 'Ay,' he said. 'Well, it was right enough so far. He is my brother, though I don't calculate he'd have published the banns just to deliver a message.—Would you, Jonathan?'

Jonathan smiled feebly. He was worried and

anxious. Bill's latest move upset his plans. For a man of his tendencies he was unusually quiet. He was thinking hard.

'Oh well,' said Bill, 'let that pass. Jonathan had his reasons for coming. He wants something, and he's not going to get it. But I'm going to give it to you, Berry, and you are going to promise me that you'll communicate with the proper authorities, and see that a helpless woman gets her rights. And in return for that promise I'm going to come like a good boy.'

'Listen. Twenty years ago this brother of mine fell in love with a girl I fancied myself. An old story that. She married him. He had a good job, and I hadn't. As a matter of fact, I was in trouble even then about a few pheasants and an odd hare or two. But never mind that. She married him, and I cleared out to Canada.'

'Have a good look at him, Berry. He's a model servant, Jonathan is. In one family all his life. Worth a good bit as he stands to them that like his kind. I don't. Neither did Milly. She stood it for a few years, and then she left him. He never divorced her.—Did you, Jonathan?'

Jonathan shook his head. 'No,' he said. 'Scandal is not looked on kindly in the servants' hall.'

'You see, Berry?' continued Bill with fierce scorn. 'Always an eye for what was right, Jonathan had. He made that girl's life a hell—but that was on the Q.T. When it came to open scandal, it wouldn't do. So he never divorced her.'

'She came to me. Silly, wasn't she? Black sheep of the family—that was me. But she knew I wouldn't hurt her. And she came to me, but it was too late then. I'd gone all to pieces; I wouldn't let her stop with a man wanted by the police for all sorts of things. Besides, she was my brother's wife. It didn't seem right, somehow—and I wasn't thinking of the scandal, neither.'

'But now, just you listen to this, Berry. Funny how things work out; Milly's father got on a bit, and he's left a tidy bit of money.—How much, Jonathan?'

Jonathan moved restlessly. 'About twenty thousand,' he said.

'Fancy that, Berry,' said Bill. 'Twenty thousand, and all left to Jonathan's lawful wedded wife. And the only man who knows whether she's still alive is bad Bill Grimsdon. Funny, isn't it?'

Corporal Berry dropped his hand from his gun at last, and relaxed slightly. He began to see the meaning of all this.

Bill Grimsdon winked at Berry.

'You've forgiven her, haven't you, Jonathan?' he asked.

Jonathan frowned heavily. 'This is not matter for joking,' he said. 'My relations with

my wife are my affair. But it is your duty, William, to help in getting her back where she can claim her legacy.'

'That's right,' said Bill. 'So it is. But mark this, Berry: if anything happens to Milly, the money goes to her lawful wedded, and, as I'm going under right away, I can't look after her. And I'm not trusting brother Jonathan. And that's where you come in.'

He took a sheet of paper from his pocket. It was worn and dirty, and showed evidences of long association with the odds and ends of things in his pockets. He handed it to Berry. 'There you are,' he said. 'Her name and address is written down there. You're a decent sort, Berry—be careful with it. That's a real woman, that is. Too good for either Jonathan or me. You'll see things right for her?'

Berry took the paper. 'Right you are, Grimsdon,' he said. 'I'll see to it.'

Grimsdon nodded cheerfully. 'Right you are,' he said. 'That's all—except I just want two words with brother Jonathan alone. And then I'm ready. You won't mind standing a bit away, Berry. You can watch with your gun out if you like.'

Berry hesitated. 'Well, look here,' he said. 'There's been——'

'I know, Berry. But this is the last. Just two minutes.'

Berry nodded, and walked about thirty paces away and then stood watching. His suspicions were considerably softened, but he was not forgetting the chance of a trick.

'Well, Jonathan, you don't look pleased,' said Bill. 'What's the matter. Berry'll see to that.'

Jonathan nodded with an attempt at cheerfulness. 'Yes,' he said. 'But it isn't very nice to be distrusted by my own brother.'

Bill laughed. 'Oh, come off it,' he said. 'I know you, and you know me. That glory hallelujah business doesn't go. Do you think I don't know what you meant to do? Well, you won't do it. That girl wouldn't have had a minute's peace—if you decided to let her live. Even now, you'll be on her track as soon as she handles the money.'

He tossed his cigarette away and stood up slowly. 'Milly told me a few things,' he said. 'Just a few. Not half of what there was to tell; but enough for me. I don't suppose you'll ever know what you did to her. But I do. And you are not going to do it again. She's going to be free of you for ever.'

His tone had changed and deepened. His eyes were stern and cold. Jonathan Grimsdon shivered.

'I swear to you, William,' he said, 'that I'll not——'

'Don't lie,' said Bill. 'You can't keep away from money. And you can't help being a bullying, cowardly hypocrite. But you made a mistake when you came here. I'm done, but I can still see that Milly has a chance. And I'm going to, now.'

Something warned Jonathan. With a startled squeak he began to run. At the same moment Corporal Berry realised that something was wrong, but he was just too late. His gun flashed a fraction of a second after Bill Grimsdon's, and Bill fell almost simultaneously with Jonathan. Both bullets went true. The brothers went to their account together.

THE MENTA INDUSTRY OF PIEDMONT.

By EUSTACE REYNOLDS-BALL.

THERE is a wide stretch of country between the foot-hills of the Cottian Alps and the river Po, near Villafranca-Piemonte, which is transformed every August into a perfumed paradise; in more prosaic language, this region is mainly given up to the cultivation of that most aromatic of flowers, the peppermint plant.

The scientific name of the cultivated species is *Mentha piperita*, popularly known as peperina—not to be confounded with peperone (cayenne-pepper plant), whose golden bulbous spheres make such a brilliant show on the vegetable stalls on market-days in the country towns of Piedmont.

Peperina is not indigenous, but was imported from England. It is not sown, but planted from saplings in the spring and autumn. It grows very quickly, sending out long creepers which take root, and, under favourable conditions, the plant will reach a height of three

feet or more. After the planting, unlike vines, it requires little attention.

The principal centres of this industry are Lombriasco, Casalgrasso, Pancalieri, Polonghera, and Vigone, ancient river-side villages which have made their mark in the history of Piedmont and the House of Savoy. These historic villages, situated on the borders of the territories then belonging to the county of Savoy and the marquisate of Saluzzo (ceded by the French to the Duke of Savoy in 1601), were of considerable importance, though ignored by the guide-books.

Lombriasco has still some relics of its pristine grandeur in an ancient castle, which is included among Italy's 'National Monuments.' It gives its name also to the treaty made in 1319 between Philip of Acaia and the Viscount of Milan.

Pancalieri was taken from Ludovic, Marquis

of Saluzzo, by Carlo I. of Savoy in 1486. At Polonghera is to be seen an ancient castle containing some remarkable frescoes. Vigone was the seat of the States-General of the Duchy of Savoy in 1522, in the reign of Carlo III.

Pancalieri is the most important centre of the peppermint culture, and here are to be found nearly a dozen distilleries. About the middle of August all these distilleries are in full swing.

The menta fields are mown in the same manner as hay; as a rule, this is done either in the early morning or after sunset. Then the menta is tied into sheaves and taken at once to the distillery, as it deteriorates if left in the open to dry. Generally the harvest takes place in the first fortnight of August.

The huge vats (partially filled with water) are crammed to the brim with the tightly-packed bundles of menta, and then the lids are hermetically closed down. From these receptacles the vapours of the essential oil are condensed in refrigerators, and then conducted into collectors, where the essence, being lighter, is easily separated from the water.

The essential oil, which passes drop by drop, is of a pale straw colour (which gets darker as it is exposed to the air), with a very pungent, but not unpleasant, smell, and a distinctly aromatic flavour. This oil is used not only in the manufacture of the well-known *Crème de Menthe* (the ladies' liqueur par excellence), but in medicine and perfumery. In common with all aromatic plants, but in a greater degree than most, it possesses useful anti-spasmodic and stimulating properties.

The period of distilling lasts from twenty to twenty-five days. With a still capable of holding some 700 to 800 lb. (roughly 320 to 365 kilogrammes) of the menta plants, the distilling would be completed in a little over two hours,

and the average of essential oil produced would vary from about 1 lb. to 2 lb.; so when it is remembered that the menta plants cost only 30 to 35 centimes the kilo., while the oil fetches from 200 to 250 lire a kilo., it will be realised that there is usually a considerable profit.

One of the most modern stills, working uninterruptedly for twenty-four hours, would produce as much as twelve kilo. of oil. In Pancalieri alone there are no fewer than eighty stills in operation.

The distilling takes place in open sheds, so that the whole country round is impregnated with the delightful aromatic fragrance. Indeed, a visit to a Piedmontese menta factory does not in any way offend the most sensitive olfactory organs, which, as tourists know to their cost, is by no means the case when visiting the flower distilleries at Grasse.

A few statistics will show the importance of this industry. The whole world's output of essence of peppermint is 1,200,000 kilo., of which formerly Great Britain was the chief producer. Now Japan (over 100,000 kilo.) and the United States supply the most.

Commercially, the essence is graded according to the proportion of *mentolo*, the essential principle. The highest grade is produced by Japan with a percentage of 90 per cent. of mentolo; the English (Surrey) variety shows from 50 to 70 per cent.; while the Piedmontese has about 50 per cent. The French and Russian varieties are deficient in mentolo, but very little of these is exported, the output being used for home consumption.

The annual production of the Piedmontese essence has, since the War, varied from 20,000 to 25,000 kilo., for which France and South America are the chief markets. The total value exceeds 50,000,000 lire.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER VI.—continued.

NEXT day, the first of September, the Scottish Press published a short account of Mr Bandicott's discovery, and the *Scotsman* had a leader on it. About noon a spate of telegrams began, and the girl who carried them on a bicycle from Inverlarrig had a weary time of it. The following morning the Press of Britain spread itself on the subject. The *Times* had a leader and an interview with a high authority at the British Museum; the *Daily Mail* had a portrait of Mr Bandicott and a sketch of his past career, a photograph of what purported to be a Viking's tomb in Norway, and a chatty article on the law of treasure trove. The *Morning Post* congratulated the discoverer in the name of science, but lamented in the name of patriotism that

the honour should have fallen to an alien—views which led to an interminable controversy in its pages with the secretary of the Pilgrims' Club and the president of the American Chamber of Commerce. The evening papers had brightly written articles on Strathlarrig, touching on the sport of deer-stalking, Celtic mysticism, the crofter question, and the law dealing with access to mountains. Straightway the special correspondents had begun to arrive from all points of the compass, so that the little inn of Inverlarrig had people sleeping in its one bathroom and under its dining-room table. By the morning of 2nd September the glen had almost doubled its male population.

That morning, after some rain in the night,

broke in the thin fog which promised a day of blazing heat. Sir Edward Leithen, taking the air after breakfast, decided that his attempt should be made in the evening, for he wanted the Larrig waters well warmed by the sun for the type of fishing he proposed to adopt. Benjie had faithfully reported to him the precautions which the Bandicotts had adopted, and his meditations were not cheerful. With luck he might get a fish, but only by a miracle could he escape unobserved. His plan depended upon the Lang Whang being neglected by the watchers as not worthy of their vigilance, but, according to Benjie's account, even the Lang Whang had become a promenade. Leithen had lost now any half-heartedness in the business, and his obstinate soul was as set on victory as ever it had been in a case in the law courts. For the past four days he had thought of nothing else; his interest in Palliser-Yeates's attack on Glenraden had been notably fainter than that of the others; every energy he had of mind and body was centred upon killing a fish that night and carrying it off. With some amusement he reflected that he had dissipated every atom of his ennui, and he almost regretted that apathy had been exchanged for this violent preoccupation.

Presently he turned his steps to the arbour to the east of the garden, which formed at once a hiding-place and a watch-tower. There he found his host busied on the preparation of his speech with the assistance of Lamancha, who was also engaged intermittently in the study of the ordnance map of Haripol.

'It's a black look-out for you, Ned,' said Sir Archie. 'I hear the Bandicotts have taped off every yard of their water, and have got a man to every three. Benjie says the place only wants a piper or two to be like the Muirtown Highland Gathering. What are you going to do about it?'

'I'm going to have a try this evening. I can't chuck in my hand, but the thing's a stark impossibility. I hoped old Bandicott would be so excited at unearthing the Viking that he would forget about precautions, but he's as active as a beaver.'

'That's the young 'un. He don't give a damn for Vikings, but he's out to protect his fish. You've struck the American business mind, my lad, and it's an awful thing for us casual Britons. I suppose you won't let me come down and watch you. I'd give a lot to see a scrap between you and that heathen Angus.'

At that moment Benjie, wearing the waterproof cape of ceremony, presented himself at the arbour door. He bore a letter, which he presented to Sir Archie. The young man read it with a face which was at once perplexed and pleased.

'It's from old Bandicott. He says he has got some antiquarian swell—Professor Babwater I think the name is—coming to stay, and he

wants me to dine to-night; says the Radens are coming too. . . . This is the devil. What had I better do, Charles?'

'Stay at home. You'll put your foot in it somehow if you go. The girl who held up old John will be there, and she's bound to talk about John Macnab, and you're equally bound to give the show away.'

'But I haven't any sort of excuse. Americans are noted for their politeness, and here have I been shutting the door in the face of the poor old chap when he toiled up the hill. He won't understand it, and people will begin to talk, and that's the quickest way to blow the gaff. Besides, I've got to give up this lie about my ill-health if I'm to appear at the meetin' the day after to-morrow. What do *you* say, Ned?'

'I think you'd better go,' Leithen answered. 'We can't have the neighbourhood thinking you are plague-stricken. You'll be drinking port while I'm being carted by the gillies into the coal-hole. But for Heaven's sake, Archie, go canny. That Raden girl will turn you inside out if you give her a chance. And don't you try and be clever, whatever happens. If there's a row, and you see me being frog-marched into captivity, don't trouble to create a diversion. Behave as if you had never seen me in your life before. . . . You hadn't heard of John Macnab except from Miss Raden, and you're desperately keen to hear more, you understand. Play the guileless innocent, and rack your brains to think who he can be. Start any hare you like—that he's D'Annunzio looking for excitement . . . or the Poet Laureate . . . or an escaped lunatic. And keep it up that you're in delicate health. Oh, and talk politics—they're safe enough. Babble about the meeting, and how the great Lamancha's coming up for it all the way from the Borders.'

Archie nodded with a contented look in his eyes. 'I'm goin' to take your advice.—Where did you get this note, Benjie? From Mactavish at the lodge? All right, I'll give you a line to take back with you.—By the way, Ned, what's your get-up to-night? I'd better know beforehand in case of accidents.'

'I shall look the basest kind of poaching tramp. I've selected my costume from the combined wardrobes of this household, and I can tell you it's pretty dingy. Mrs Lithgow is at present engaged in clouting the oldest pair of Wattie's breeks for me. . . . My only chance is to be a regular ragamuffin, and the worst I need fear then is a rough handling from the gillies. Bandicott, I take it, is not the sort of fellow to want to prosecute. If I'm caught—which is fairly certain—I'll probably get a drubbing, and spend the night in the cellar, and be given my breakfast next morning and kicked out. It's a different matter for you, Charles, with the legally-minded Claybody.'

'What odds are you offerin'?' Sir Archie

asked. 'John backed himself, and I took a tenner off him. What about an even fiver?'

'I'll give you three to one in five-pound notes that I win,' said Leithen grimly. 'But that's pride, not conviction.'

'Done with you, my lad,' said Sir Archie, and departed to write an acceptance of the invitation to dinner.

Fish Benjie remained behind, and it was clear that he had something to communicate. He caught Lamancha's eye, who gave him the opening he sought by asking what was the news from Strathlarrig. Benjie had the instinct of the ballad-maker, and would begin his longer discourses with an epic flourish of the 'Late at e'en drinkin' the wine' style.

'It was at fower o'clock this mornin' they started,' he announced, 'and they're still comin'.'

'Coming? Who?' Leithen asked.

'Jornalists. The place is crawlin' wi' them. I seen six on bicycoles and five in cawrs and twa in the Inverlarrig dowie-cairt. They're a wantin' to see auld Bandicott, but auld Bandicott will no' see them. Mactavish stops them at the lodge, and spiers what they want, and they gie him cairds wi' their names prentit, and he sends them up to the Hoose, but he'll no' let them enter. Syne the message comes back that the maister will see them the day after the morn, but till then naebody maun put a fit inside the gates.'

'What happened then?' Leithen asked with acute interest.

'It hasna happened—it's still happenin'! I never in my life heard sic a lot o' sweer words. Says ane, "Does the auld dotterel think he can defy the British Press? We'll mak his life no' worth leevin'." Says another, "I've come a' the gait frae London, and I'll no budge till I've seen the banes o' that Viking!" Ane or twa went back to Inverlarrig, but the feck o' them just scattered like pairicks. They clamb the wall, and they waded up the water, and they got in by the top o' the linns. In half an hour there was half-a-dizzen o' them inside the Strathlarrig policies. Man——' here he fixed his glowing eye on Leithen—'if ye had been on the Lang Whang this mornin' ye could have killed a fish and naebody the wiser.'

'Good Lord! Are they there still?'

'Na. They were huntit oot. Every man about the place was huntin' them, and Angus was roarin' like a bull. The young laird thoct they were Bolshies, and cam doun wi' a gun. Syne the auld man appeared and spoke them fair, and telled them he was terrible sorry, but he couldna see them for twa days, and if they contentit themselves that lang he would hae them a' to their denner and show them every-thing. After that they gaed awa, but there's aye mair arrivin', and I'm expectin' mair riots. They're forritsome lads, thae jornalists, and a

dour crop to shift. But they're kind folk, and gie'd me a shillin' apiece for advisin' them.'

'What did you advise?'

'I advised them to gang doun to Glenraden,' said Benjie, with an elfin smile. 'I said they should gang and howk in the Piper's Ring and they would maybe find mair treasure. Twa-three o' them got spades and picks and startit off. I'm thinkin' Macpherson will be after them wi' a whup.'

Leithen's brows were puckered in thought. 'It looks as if my bet with Archie wasn't so crazy after all. This invasion is bound to confuse Bandicott's plans. And you say it's still going on? The gillies will be weary men before night.'

'They will that,' Benjie assented. 'And there's no' a man o' them can rin worth a docken, except Jimsie. Thae jornalists was far soopler.'

'More power to the Press. Benjie, back you go and keep an eye on Strathlarrig, and stir up the jornalists to a sense of their rights. Report here this afternoon at four, for we should be on the move by six, and I've a lot to say to you.'

In the course of the morning Leithen went for a walk among the scaurs and dingles of Crask Hill. He followed a footpath which took him down the channel of a tiny burn and led to a little mantelpiece of a meadow, from which Wattie Lithgow drew a modest supply of bog-hay. His mind was so filled with his coming adventure that he walked with his head bent, and at a turn of the path nearly collided with a man.

Murmuring a gruff 'Fine day,' he would have passed on, when he became aware that the stranger had halted. Then to his consternation he heard his name uttered, and had perforce to turn. He saw a young man in knickerbockers and heavy nailed boots, who smiled diffidently, as if uncertain whether he would be recognised.

'Sir Edward Leithen, isn't it?' he said. 'I once had the pleasure of meeting you, sir, when you lunched with the Lobby journalists. I was then on the Lobby staff of the *Monitor*. My name is Crossby.'

'Of course, of course. I remember perfectly. Let's sit down, Mr Crossby, unless you're in a hurry. Where are you bound for?'

'Simply stretching my legs. I was climbing rocks at Sligachan when my paper wired me to come on here. The Press seems to have gone mad about this Viking's tomb—think they've got hold of a second Tutankhamen. So I got a fisherman to take me and my bicycle over to the mainland and bicycled the rest of the road. I thought I had a graft with old Bandicott, for I write for his paper—the *New York Bulletin*, you know—but it appears there's nothing doing. Odd business, for you don't

often find Americans shy of the Press. But I think I've found out the reason, and that makes a good enough story in itself. Perhaps you've heard it?

'No,' said Leithen, 'but I'd like to, if you don't mind. I'm not a journalist, so I won't give you away. Let's have it.'

He stole a glance at his companion, and saw a pleasant, shrewd, boyish face, with the hard sunburnt skin of one in the prime of physical condition. Like many others of his type Leithen liked journalists as much as he disliked men of letters—the former had their corners smoothed by a rough life, and lacked the vanity and spiritual pride of the latter. Also he had acquired from experience a profound belief in the honour of the profession, for at various times in his public career he had put his reputation into their hands, and they had not failed him. It was his maxim that if you tried to bamboozle them they were out for your blood, but that if you trusted them they would see you through.

'Let's hear it, Mr Crossby,' he repeated. 'I'm deeply interested.'

'Well, it's a preposterous tale, but the natives seem to believe it. They say that some fellow, who calls himself John Macnab, has dared the magnates in these parts to prevent his killing a stag or a salmon in their preserves. He has laid down pretty stiff conditions for himself, for he has to get his beast off their ground and hand it back to them. They say he has undertaken to pay five hundred pounds to any charity the owner names if he succeeds, and one thousand pounds if he fails—so he must have money to burn; and it appears that he has already paid the five hundred pounds. He started on Glenraden, and the old Highland chief there had every man and boy for three days watching the forest. Then on the third day, when everybody was on the mountain tops, in sails John Macnab and kills a stag under the house windows. He reckoned on the American's dynamite charges in his search for the Viking to hide his shot. And he would have got away with it too, if one of the girls hadn't appeared on the scene and cried 'Desist!' So what does this bandit do but off with his hat, makes his best bow, says "Madame, your servant," and vanishes, leaving the chief richer by a thousand pounds? It's Bandicott's turn to-day and to-morrow, and the Strathlarrig household is squatting along the river banks, and the hard-working correspondent is chivvied away till the danger is past. I'm for Macnab myself. It warms my heart to think that there's such a sportsman alive. It's pure Robin Hood.'

Leithen laughed. 'I back him too. Are you going to publish that story?'

'Yes, why not? I've written most of it, and it goes by the afternoon post.' Mr Crossby pulled out a note-book and fluttered the leaves.

'I call it "The Return of Harald Blacktooth." Rather neat, I think. The idea is that when they started to dig up the old fellow his spirit reincarnated itself in John Macnab. I hope to have a second instalment, for something's bound to happen at Strathlarrig to-day or to-morrow. Are you holidaying here, Sir Edward? Crask's the name of this place, isn't it? They told me that that mad fellow Roy-lance owned it.'

Leithen nodded. He was bracing himself for another decision of the same kind as he had taken when he met Fish Benjie. Providence seemed to be forcing him to preserve his incognito only by sharing the secret.

'But of course,' Mr Crossby went on, 'my main business here is the Viking, and I'm keen to find some way to get over Bandicott's reticence. I don't want to wait till the day after to-morrow and then come in with the ruck. I wonder . . . would it be too much to ask you to give me a leg up? I expect you know the Bandicotts?'

'Curiously enough, I don't. I am not sure how far I can help you, Mr Crossby, but I rather think you can help me. Are you, by any happy chance, a long-distance runner?'

The journalist opened his eyes. 'Well, I used to be. South London Harriers, you know. And I'm in fairly good condition at present after ten days on the Coolin rocks.'

'Well, if I can't give you a story, I think I can put you in the way of an adventure. Will you come up to Crask to luncheon and we'll talk it over?'

CHAPTER VII.—THE OLD ETONIAN TRAMP.

SIR ARCHIE got himself into the somewhat ancient dress-coat which was the best he had at Crask, and about half-past seven started his Hispana (a car in which his friends would not venture with him at the wheel) down the long hill to the gates of Strathlarrig. He was aware that somewhere in the haugh above the bridge was Leithen, but the only figure visible was that of Jimsie, the Strathlarrig gillie, who was moodily prowling about the upper end. As he passed the Wood of Larrigmore, Benjie's old pony was grazing at tether, and the old cart rested on its shafts. The embers of a fire still glowed among the pine needles, but there was no sign of Benjie. He was admitted after a parley by Mactavish the lodge-keeper, and when he reached the door of the house he observed a large limousine being driven off to the back premises by a very smart chauffeur. Only Haripol was likely to own such a car, and Sir Archie reflected with amusement that the host of John Macnab was about to attend a full conclave of the enemy.

The huge ugly drawing-room looked almost

beautiful in the yellow light of evening. A fire burned on the hearth, after the fashion of Highland houses even in warm weather, and before it stood Mr Acheson Bandicott with a small clean-shaven man, who was obviously the distinguished professor in whose honour the feast was given, and Colonel Raden, a picturesque figure in kilt and velvet doublet, who seemed hard put to it to follow what was clearly a technical colloquy. Agatha and Junius were admiring the sunset in the west window, and Janet was talking to a blonde young man, who seemed possessed of a singularly penetrating voice.

Sir Archie was unknown to most of the company, and when his name was announced every one except the professor turned towards him with a lively curiosity. Old Mr Bandicott was profuse in his welcome, Junius no less cordial, Colonel Raden approving, for indeed it was not in human nature to be cold towards so friendly a being as the laird of Crask. Sir Archie was apologetic for his social delinquencies, congratulatory about Harald Blacktooth, eager to atone for the past by an exuberant neighbourliness. 'Been havin' a rotten time with the toothache,' he told his host; 'I roost up alone in my little barrack, and keep company with birds. . . . Bit of a naturalist, you know. . . . Yes, sir, quite fit again, but my leg will never be much to boast of.'

Colonel Raden appraised the lean athletic figure. 'You've been our mystery man, Sir Archibald. I'm almost sorry to meet you, for we lose our chief topic of discussion.

You're fond of stalking, they tell me. When are you coming to kill a stag on Glenraden?'

'When will you ask me?' Sir Archie laughed. 'I'm still fairly good on the hill, but just now I'm sittin' indoors all day tuggin' at my hair and tryin' to compose a speech.'

Colonel Raden's face asked for explanations.

'Day after to-morrow in Muirtown. Big Conservative meetin', and I've got to start the ball. It's jolly hard to know what to talk about, for I've a pretty high average of ignorance about everything. But I've decided to have a shot at foreign policy. You see, Charles——' Sir Archie stopped in a fright. He had been within an ace of giving the show away.

'Of course. 'Pon my soul, I had forgotten you were our candidate. It's an uphill fight, I'm afraid. The people in these parts, sir, are the most obstinate reactionaries on the face of the globe, but they've been voting Liberal ever since the days of John Knox.'

Mr Bandicott regarded Sir Archie with interest. 'So you're standing for Parliament?' he said. 'Few things impress me more in Great Britain than the way young men take up public life as if it were the natural coping-stone to their education. We have no such tradition, and we feel the absence of it. Junius would as soon think of running for Congress as of keeping a saloon. Now I wonder, Sir Archibald, what induced you to take this step?'

But Sir Archie was gone, for he had seen the beckoning eyes of Janet Raden.

(Continued on page 196.)

ROTTEN ROW: A PUZZLING PLACE-NAME.

By DAVID MACRITCHIE.

IT is stated by Sir John Lindsay, Town Clerk of Glasgow, in his historical sketch of the city, that 'in 1611 James VI. made the city a royal burgh, and two years later added to it the lands of Rottenrow.' The name of these lands is still commemorated by the street so called, adjacent to the Cathedral; and no doubt the street crosses part of the estate made over by King James. This curious and unpleasant name is found in other parts of Scotland, as the following examples show.

Among the writs of the lands and barony of Oughtterlony, *alias* Kelly, in the county of Forfar, according to an inventory of 6th January 1561, is a Renunciation by Christina Bowack of Rottenraw. (See page 230 of the *Proceedings*, 1916-1917, of the Society of Antiquaries of Scotland.) This is the earliest mention of the name known to the present writer. An examination of the writs referred to would probably indicate a much earlier date. Dr John Milne, in his *Gaelic Place Names of the*

Lothians, furnishes two other examples, one in Midlothian and the other in East Lothian, but unfortunately he does not define their situation in more precise terms. It may be that his East Lothian specimen ought to be identified with the 'Rodenrow' at Pressmennan, a few miles south-west of Dunbar, which appears on the map of 1654 executed by John and Cornelius Blaeu. So far, these are the only examples noted by me in Scotland. The famous Rotten Row of Hyde Park, London, is pretty obviously in the same category. It may be assumed that, if one takes in the whole of Great Britain, the list can be largely extended, and that in nearly all the instances, if not in all, the name can be traced to one source.

Various surmises have been made with regard to this source. Beginning with the London instance, we find that Edward Walford (*Old and New London*, Vol. IV., pages 386 and 398), referring to a map of Hyde Park, about the year 1736 or 1737, states that it shows 'the two

roads running parallel to the Serpentine on the south, marked respectively as "The King's Old Road, or Lamp Road," and "The King's New Road"; the former corresponding nearly with the Rotten Row of our time, and the latter running, as now, inside the Park, close to the Knightsbridge Road and Kensington Gore. . . . It has been suggested that the name itself is a corruption of *Route du Roi* (the king's road); but Mr John Timbs says, "the name *Rotten* is traced to *rotteran*, to muster; a military origin which may refer to the Park during the Civil War." If we admit that *Route du Roi* might become corrupted into *Rotten Row*, that theory seems to derive support from the circumstance that the road in question, or one very near it, was known as 'The King's Old Road' in 1736. But the acceptance of this solution would mean that the English name had given place to a French equivalent after 1736, which latter, with great rapidity, and by a process difficult to follow, had assumed the shape of 'Rotten Row' during the eighteenth century. Sheridan's reference to 'the hack Bucephalus of Rotten Row,' in his play of *Pizarro*, shows that the present name was then (1799) well established.

The compilers of the *New English Dictionary* regard *Rotten Row* as 'apparently' a compound of the ordinary adjective 'rotten' and the noun 'row.' They add that 'the name was formerly applied to various streets in different towns, the reason for the application being usually obscure. In Scotland and the north of England the older form is usually *ratton raw* (see *RATTON* and *ROTTAN*), and thus apparently of different origin.' The former of these statements was made in ignorance of the fact that in Glasgow, in 1613, the name first occurs in connection with an estate, and that in the Forfarshire instance of 1561 it would seem also to have denoted an estate, and never to have been applied subsequently to a street. As for the suggestion that the spelling *ratton* points to a different origin from *rotten*, that carries little weight; for the suggestion is based on the fact that *ratton* means 'a rat,' as far back as the fourteenth century at least. But this meaning is also represented by the spelling *rottan*, and there is no vital difference in the various spellings and pronunciations of this word. However, the 'rat' explanation has been frequently advocated. Rats are still called *rattons*, *rottens*, or *rottens*, by dialect-speakers in Lowland Scotland and the northern half of England as far south as Cheshire. The advocates of this interpretation assume that the streets thus denominated were or are the homes of poor and miserable people, and that the contemptuous name of 'Rat Row' was bestowed upon such streets in allusion to their dirt and squalor. Now, although the rat theory may not satisfactorily explain 'Rotten Row,' it cannot be lightly dismissed. It may, for example, account

for the name of Rotten Calder Water given to the lower part of Calder Water in Lanarkshire. The Calder does not receive that prefix until after its conflux with the Rotten Burn as it enters the parish of Blantyre. The name, therefore, originates with the Burn, which, it is not unreasonable to assume, may have been infested with rottens or rats. Then, there is Rotten Cleuch in East Lothian, which may have been so called for the same reason.

Yet another theory is that the true explanation is to be found in the fact that the *rowan*, or berry of the mountain ash, is pronounced as *rodden* in some districts; notably in Caithness, Inverness-shire, Moray, and Banffshire, where people commonly talk of *roddens* and *rodden-trees*. The shades of pronunciation, vocalic or dental, are of no real importance. Thus, although the Lancashire dialect-speaker calls a rat a *rodden*, and not a *rotten*, he is not using a word that is essentially different from the latter form. There is, perhaps, more to be said for the mountain-ash (*Pyrus Aucuparia*) theory than any other. A special virtue used to attach to the rowan-tree and its berries, as a protective against witchcraft. 'I have tied red thread round the bairns' throats, and given ilk ane of them a riding-wand of rowan-tree, forby sewing up a slip of witch-elm into their doublets,' says Dame Glendinning to Father Eustace; 'and I wish to know of your reverence if there be any thing mair that a lone woman can do in the matter of ghosts and fairies?' 'Rowan-tree and reid threed gar the witches tyne their speed' is an old saying in Scotland. And the same superstition is found in England, from Northumberland to Kent. 'Witches have no power where there is rowan-tree wood' is a Yorkshire belief; and the Lincolnshire peasant plants several rowan-trees in his garden to ward off evil. Suppose this practice to be extended from cottages and farms to hamlets and villages, and a plausible enough explanation can be found for the existence of *rotten-rows* in every county of Great Britain.

Mention may also be made of what seems to be a secondary meaning of the word in its sense of 'rat.' The *English Dialect Dictionary* reports that in Banffshire *rottan* is applied to 'a person of small stature, often with the idea of a dark complexion and a profusion of hair.' With this meaning in view, *Rotten Row* might be regarded as an analogue of the *Tinkler Row* found in more southern localities.

It is recognised by all students of place-names that the first thing to do is to try to discover the earliest form of the word in question. Place-names have a knack of getting so corrupted in the course of time that their true meaning becomes quite obscured. Time, patience, and united effort are therefore all required before the correct solution of many names can be arrived at.

MAN—OR BEAST?

CHAPTER III.

I.

FIVE men and their host sat round Colonel Buxton's shining mahogany dinner-table. The naked-footed servants in their broad red belts, white clothes and turbans, had vanished, leaving the sahibs to their wine.

'Yes,' said Professor Peddle, the well-known anthropologist, in reply to a remark of Frome's, 'it was extremely lucky that I was in Bombay, and that you, Buxton, read the announcement of my arrival in the *Pioneer*.' He paused to add iced water to his port, to the secret mirth of the rest, even of the colonel, whose wines were the best in the station.

'I would gladly have travelled another thousand miles to inspect that find of yours,' Peddle continued, in his rather high-pitched, meticulously careful voice; 'I had always wished to examine the Siwalik Hills; the South Kensington Museum has interesting fossil remains obtained from them. But I never had leisure to come so far up-country, until your letter arrived telling me of the find, and so kindly offering to put Hart and myself up, just when we had some time to spare before our expedition to Burma. The colonel and I were at Cambridge together,' he added to his neighbour, Leyton.

'What do you make of these fossils, professor? We haven't heard much,' said Frome.

Peddle, well-fed, and wiping watered port from his lips, turned benignly on the questioner, his fox-coloured beard fluffing slightly in the wind from the over-head fan. 'I will try not to be too technical,' he smiled, as if at a schoolboy; 'they were the fossilised skeletons of one of the earliest types of the human race. They date from—I suppose it would mean little to you in geological ages—from the period when the British Isles, as such, did not exist, since they were part of the vast tract of tropical swamp and forest now called Europe. The unusually heavy rains you have had this season no doubt caused the landslide which exposed portions of the remains, fossilised in the limestone. What is peculiar is the fact that the creatures appear to have been herded together in a cave—eight of them. The cave had fallen in—earthquakes were frequent in those ages—but I found traces of its existence; and in my opinion it was the lime-drip from its roof which so perfectly preserved the remains.' He looked round the attentive circle, blinking. 'It is possible that these semi-apes—one can scarcely call them men—were almost the last survivors of their kind lurking in the fastnesses of the Siwaliks; and that a slightly higher type had evolved—from them, of course—a type

distinguished by having discovered the making of fire.'

'Can you account for so many dying in one place?' asked Buxton.

'I can only conjecture, my dear colonel,' answered the professor, leaning back with his finger-tips together. 'The ape-men of those times were arboreal, like the orang-utans of the Malay forests to-day. They built shelters in trees, and lived in them, not in caves. A natural forest fire may have driven these—ahem!—ancestors of ours into the cave. But possibly, though not probably, their slightly superior descendants, finding their progenitors' savagery inconvenient, set the jungle alight, and blocked the cave when their relations had taken refuge inside.'

'Ah,' said Buxton thoughtfully, 'then they'd have died frenzied with rage against the fire-makers.'

Peddle looked at him as if he thought the remark rather childish.

II.

'By the way, Major Leyton,' said the professor, 'I heard something about your seeing unaccountably large monkeys not far from the landslide; that your chauffeur saw them also, and was killed by jumping out of the car in a panic. Is that correct?'

'More or less,' said Leyton, glancing cryptically at the colonel.

'They would have been langurs,' settled Peddle, refusing the itinerant port with a deprecating hand; 'no larger monkeys than those remain in the Siwaliks, of course. Strange that your man should have been alarmed by them; I imagined natives were used to monkeys.'

Again Leyton looked at the colonel.

'Well, they weren't—quite ordinary monkeys, you know,' supplied Buxton, lighting a fresh cigarette. 'One of them sprang at the car—Leyton felt it claw his arm. His driver was either hauled out or jumped out, and was somehow taken down the *khud* and into the *rhoo* below. We found him with a dislocated shoulder and a badly sprained ankle. He couldn't possibly have got where we found him by his own locomotion, if he'd been all night about it.'

'Dear me—dear me,' remarked Peddle, stroking his beard, as if trying to keep it tidy. 'Very strange . . . but—forgive me, Buxton—you know we men of science are trained in a strict school—he looked across at his junior colleague, Hart—'and one or two—er—debatable points occur to the factual scientific

mind, without the faintest reflection on your accuracy, major!' He smiled, blinking his near-set eyes at Leyton.

'Let's have the points, professor,' said the latter pleasantly. But there was no need for encouragement—Peddle was marshalling his arguments.

'The whole affair—the chauffeur's panic, injuries and death—are satisfactorily explained by assuming that he saw a group of langurs in the road. Their size was exaggerated by the semi-darkness, and in an access of fear he sprang from the car and rolled down the bank to the river-bed. As to the monkeys—wild animals, dazzled by the lights, have been known to leap on a car. No doubt one of the langurs did so leap, and it was its paws which you felt on your arm.' He swept the circle, as if to say, 'How about that for unanswerable commonsense?'

'A very sound and likely theory,' said Buxton mildly; 'but I'd like to supply one or two facts which haven't been mentioned.'

John Leonard sat watching intently; he was the youngest member of the party, and the most obviously intrigued.

'By all means, my dear colonel,' invited Peddle, helping himself to iced water; 'I hope I can always keep an open mind.'

'Well, one curious point is, we found the driver mother-naked. Frome picked up bits of his clothes, mere rags.'

'Got 'em here,' announced Frome, pulling some white and khaki pieces from his pocket; 'thought they might be useful as evidence.'

The professor glanced at the rags. 'To that "evidence,"' he said, with a twist of his lips, 'I reply that either the thorns he rolled through tore his clothes to ribbons, or, more likely, mad with fear, he tore them himself.'

'Ever torn khaki drill to bits with your hands?' said Leyton, with a grin.

'Madmen,' instructed Peddle, 'as is well known, have supernatural strength.'

'One more point,' continued Buxton; 'there were some very curious marks on the poor chap's flesh—contused bruises. The only others I've seen like them were those on a Malay who'd been handled by an orang-utan. The beast had been caught in a net, and the man had come too near. It grabbed him by the leg and was pulling him towards the net. He'd have been dismembered if some one hadn't held a burning stick to its paw.'

The professor gazed at Buxton. 'Do you mean to tell me,' he uttered solemnly, 'that you believe the chauffeur was carried off, and his clothes ripped from him, by *monkeys*—monkeys the size of orang-utans? My dear fellow, I'm afraid you've all been hypnotised! The unfortunate man, of course, was the victim of what I believe is known by psychologists as a veridical hallucination.'

'Which is a contradiction in terms, isn't it?'

said Buxton lightly; 'veridical meaning "true," and hallucination, "an unfounded and mistaken notion," so my dictionary says.'

'As to the marks on the skin,' pursued Peddle, ignoring the interruption, 'you, as a doctor, surely know that there are attested cases where the subjects' minds have induced imprints, even wounds, on their bodies, in keeping with the character of their obsession—the stigmata, for example.'

'That's true, but it wasn't done in a short time. It was the result of long and tremendous concentration. The human mind can do weird things to its body, but so far as I'm aware, it can't bring out the prints of gigantic hands in the space of half-an-hour.'

'One doesn't know—one doesn't know . . .' murmured the professor, frowning up at the fan as if he had just discovered what was taking liberties with his beard; 'the human mind is a wonderful thing. . . .' He took a toothpick from his waistcoat pocket and put it to its intended use, with the air of having nothing better to do for the moment.

'Shall we sit outside?' suggested Buxton; 'it's fairly cool out there.'

III.

They settled in a semi-circle of basket-chairs in the wide, electric-lit veranda, and the servants served coffee. The little throbbing lights of fireflies drifted among the giant bamboos in the garden; a small owl swooped to the gravel and vanished with some insect prey. The professor, who had refused coffee and smokes, sat slouched, apparently watching the fireflies, while the others discussed the usual topics of an Indian station. Suddenly he sat up, blinking at Buxton.

'I should like to return to our muttons—or rather our monkeys—that is, if no one objects?' he said suavely. 'I feel it is a pity to leave the subject undetermined. I have a passion for truth; Hart will endorse that.' Hart nodded loyally. 'I confess I should like to sift . . . shall we say—er—the illusory?—from the real, in this matter.'

'Same here,' said Leyton; 'but how are you going to do it?'

'First, by asking who, besides the chauffeur, can testify that he actually saw these—magnified monkeys. Mr Frome, you were there, I am told. Did you see them?'

'No,' admitted Frome, 'but——' He stopped.

'Pardon me, "but" what?'

'I believe they were there.'

Peddle sighed gently. 'Why do you believe it?'

'I'd rather not say at present. I'll leave it to the colonel to do the arguing.'

'I pass on,' submitted Peddle resignedly. 'You, captain—er—Leonard, were not there.'

The boy next to Buxton got very red. 'No, sir,' he jerked, 'but another time, in the

Siwaliks—sitting up for tiger—I saw them, by lightning. . . . Long before I'd heard a word about them.'

'Stout feller!' said the colonel, for Leonard's ear only.

Peddle glanced at the youngster with a slight, indulgent smile and no remark. He turned to Leyton. 'You were there, major; you felt a paw; did you *see* anything?'

Leyton blew out cigarette smoke with energy. 'I had the same silly hallucination as the rest,' he said dryly. 'I drove right into three of the devils—they simply vanished—didn't clear out of the way. Something gave me a very useful claw. I saw several more down the *khud*, and one holding to an aloe by the roadside.'

Peddle blinked at him. 'Your wife was there, I heard. Did she see them?'

'She saw what I did. We talked it over next day—couldn't keep off it. She was uncommonly plucky; insisted on going back to look for our man, though she was ill with fright. I don't mind saying I was in a blue funk myself.'

'Just so. Naturally, you were both affected by your man's behaviour. There remains you, colonel, who saw nothing, but believed on the testimony of the others and the condition of the injured man—'

'You're going a little too fast, Peddle,' put in Buxton, smiling. 'Did I say I didn't see anything?'

'I assumed—'

'But one mustn't assume in cross-examination, you know; assumption isn't evidence.'

The professor bowed, smiling a trifle wryly. 'I am corrected, my dear Buxton; I assume—nothing! Did you see the phantom apes?'

'I did.' The colonel's voice was casual. There followed a pregnant silence. Peddle blinked hard at his host.

'After the major had told you what he had seen?'

'He told me nothing until the next day, except that his man had jumped out of the car, and Mrs Leyton had seen him in the *rhov*. Perhaps it was thought-reading?'

'Telepathy; it is just possible,' enunciated Peddle. 'Now, Buxton, I should like to hear precisely *what* you . . . saw?'

'I'll tell you. I saw a bunch of what at first I took to be natives round some object in the *rhov*. What non-plussed me was, they were very faintly luminous. Then, during a longish blaze of lightning, I saw for certain that they weren't human, in the ordinary sense. They were like big, powerful apes. Most of them were upright, their hands reaching nearly to the ground; two of them seemed to be pawing a prone figure. The hallucination was strong enough to **make me fire**, not exactly in the hope of **hitting them**, but in case it might scare the brutes off. It was when I was ex-

amining the cliff on the far side of the *rhov* a few days later, for traces of shot, that I came upon the land-slide and the partly exposed fossils.'

'And when you reached the chauffeur, the "brutes" *had* been scared off?'

'There was nothing visible but the man, until Frome was carrying him back. When we were nearly at the bank below the road, I looked behind during a flash of lightning. The creatures were standing in the *rhov*, about where I'd first seen them; they seemed to be watching us.'

'Did you question the man when he regained consciousness?'

'He never did. I worked at him, on and off, for nearly two days, but he was in a cataleptic state, and died from shock.'

'Ah, *cataleptic*!' stressed Peddle; 'a neurotic subject.'

'High-strung, but otherwise quite normal. A mechanic brother of his, whom I saw after the death, told me Joseph had never had any sort of seizure, and was perfectly healthy.'

Peddle nodded politely. 'I give it up, my friends; I am only a poor man of science, and what am I among so many believers!' His tone was facetious, but there was the faint trace of a sneer.

IV.

'Let's get off the spooks,' said Frome; 'they give me the creeps.' He caught Buxton's eye, and the latter gave an almost imperceptible nod.

'Get the colonel to tell us about some of his experiments, professor,' Frome added. 'He showed me some queer results the other day.'

'I shall be charmed, Buxton,' responded Peddle, his benignity restored; 'anything concerned with scientific fact commands my sincere interest and respect.'

'What sort of experiments, colonel?' asked Leyton.

'Well, I won't be too technical'; Buxton shot a humorous glance at Frome. 'They're some I made in connection with photography. It was before the recent publicity given to spirit photographs, but I'd heard enough about it to set me thinking. I wondered if some of those "spirit" photos—those in which faking or other fraud had been absolutely excluded by precautions—weren't the records of the mind-pictures of the sitters at the séances. . . . People with uncommon power of thought-projection, who thought, as it were, with a high-voltage current.'

'It seemed to me that the most likely field for experiment would be a person in a state of unconsciousness, after some violent shock or emotion. I thought that a very powerful sight-impression might sink down into the sub-consciousness, and stay there for a time, dominant. It remained to be proved whether it would dominate sufficiently to register itself objectively. I contrived a special camera, which I perfected by degrees. I can't explain how the plates are

sensitised; they aren't by any means the ordinary kind. . . . This is rather a dull preamble, I'm afraid; I'll fetch the photos.' He went into the bungalow.

'A clever man—a remarkably clever man,' ruminated Peddle aloud; 'strange that he should—'

Buxton returned with a cardboard portfolio, cleared a space on a table under a light, and opened the case.

Every one gathered round except Frome, who sat where he was, hardly taking his eyes from the professor.

'I'd better explain one or two things before you see the prints,' said Buxton. 'They're highly enlarged, which gives a woolly effect. There was never a double image on any plate; it was always unified, as by the ordinary process of sight. And an interesting point is, that the better educated the mind was which had received the impression, the clearer and more life-like was the reproduction. Which goes to prove, in black and white, that *how* we see is governed by the degree to which our brains are cultivated.'

'Then they're really brain photos?' said Hart.

'It's as good a name as any other. They really belong to the mysterious borderline between the physical and the psychical. I found it was absolutely necessary that the eyes should have seen the object in a strong light, and that it should have stamped itself with horror or fear on the mind's eye. The eyes were the best transmitters, though acting through closed lids. But sometimes, when I experimented without the camera, and with plates wrapped in black material, fixed on the forehead, I got results too, only not nearly so definite as when the plates were in contact with the eyes. All of these prints were got from people in an unconscious—or, as one ought to say, a sub-conscious—state.'

He took out the uppermost photo and handed it to Peddle.

'What—er—is this supposed to represent?' asked the professor, fixing Buxton over the rims of the pince-nez he had put on to examine the print.

'That's a negro woman's "ideograph" of a West African witch-doctor. He'd been "doctoring" her for weeks, before I was called in by her husband, who had a strain of white in him. I got this portrait of the devil-doctor the day before she died. He'd sat over her for hours, every day, under an awning of matting outside the hut, and his hideous phiz had got well into her brain. She was scared to death of him; she knew he was poisoning her.'

'Buxton,' said the professor judicially, 'I'm going to put a straight question. Is this, or is it not, a hoax—a fake?'

'Quite a natural question—it's a new departure, and I know it seems rather incredible. A Frenchman has done the same thing, as a

matter of fact, and published the results. No, all these prints are entirely genuine, not even touched up.'

'Astonishing . . . astonishing!' ejaculated Peddle. 'My dear fellow, this must have made your name—'

'Oh, he's a very big bug now, professor,' said Frome; 'got half-a-dozen swell letters after his name, but he's so beastly modest?'

Buxton laughed boyishly.

'What's this one, colonel?' asked Leyton, taking up the next print, which had lain face downwards.

'It appears to be the head of a wild beast; yes, a kind of tiger,' said Peddle, peering.

'Rather impressionistic, but the beast was springing. The man it was coming for looked up from his work to see it flying through the air at him. I was staying with a planter in Assam, and one of his coolies was struck down by an old man-eater in broad daylight. The man must have fainted with fright the instant he saw the tiger. . . . No, he got over it—he'd hardly been pounced on before the other men came to the rescue. He was a long time coming round, but I knew he was all right, and I kept the plate against his eyes for about half-an-hour. It's a bit primitive; the open jaws evidently impressed the poor beggar most—the beast is all mouth and teeth.'

v.

'I am dumbfounded!' sighed Peddle. 'I am consumed with curiosity to see the rest! You told us that in proportion to the education of the person, so are the "ideographs" true to life; have you one projected by a civilised mind?'

'Or connected with a crime?' asked Hart wistfully. All but Peddle laughed.

'Well, I have one that supplies both those requirements, but I can't show it. I suppose I oughtn't to have kept it, but it's always locked up.'

'Story! story!' demanded Leyton, thumping the table.

'It's a tragic story, of several years ago now. Sorry, but I can't tell it. Someone might guess who the people concerned were—they were well known in society. The real facts were never published.'

'By jove!' exclaimed Hart with relish, 'this discovery of yours starts a new era in the detection of crime; doesn't it, colonel?'

'Not quite so sensational as that, I'm afraid,' said Buxton, amused. 'It's so seldom that circumstances allow of my bag of tricks being used with any success.'

'What about the sort of case we were discussing this evening?' asked Peddle; 'I mean hallucinations—delusions, and so on. Can they be reproduced on your plates?'

'They never are,' said Buxton slowly, 'and I've experimented with them often enough. I was once in charge of a big lunatic asylum in

England. All sorts of obsessions, manias, hauntings, I lived with for two years, many of them minutely described by the sufferers—natural and fabulous beasts, gigantic birds, imaginary human beings, even devils. Whenever there was a chance, during unconsciousness, usually coma or catalepsy, I tried my dodge in the hope of registering something, but the plates were always completely blank.

'Intensely interesting,' brooded Peddle. 'It suggests many avenues of thought—'

'What's this one?' broke in Leyton, whom the professor bored. He picked up a print which, like the others, was face-downwards.

He made a low, inarticulate sound. 'Good Lord, colonel. . . . It's one of those horrible mugs on the Mohand Road. . . . Joseph's impression, of course, as it glared close to the poor chap's face!'

Peddle, almost snatching the print from him, stared at it, mouthing soundlessly. '. . . A—a species of anthropoid ape,' he managed at last. 'Surely, colonel, you got this from—'

'I got that print,' interrupted Buxton suavely, 'from a man who saw the thing by lightning. It's one of the "hallucinations" which killed Leyton's driver.'

THE END.

THE VELVET CARPET.

By FREDERICK GRAVES.

AT last the summit!

I paused, rather breathless, and gazed around at the awe-inspiring scene lit, as by an old-world flame, by the autumn sunset; the far wild peaks, jagged and black against a sky of molten gold with carmine flakes; deep in the glooming gulf below, the dim purple of the loch. It was strangely lonely, silent, and still—there was no wind—and very cold, and I turned to descend once more into the world of life ere the light should fail, when I caught sight of a tiny red patch on the ben-side. It was an awkward place to reach, skirting as it did a precipitous corrie that had patches of snow in its crannies, but I got to it and gathered a tuft of the precious treasure—a rare *Andrea*, the mountain moss.

Many people will recall the old school-book story of 'Eyes and No Eyes.' How often is it illustrated in our walks through life, where we pass every day some wonderful thing till, perhaps, a little incident makes us peer into and see it with new eyes. I often think of this in connection with those wonderfully beautiful and common objects the mosses, for few people who see every day the tiny patches of vivid green realise what a wealth of beauty is to be found in them by the nature student.

The study of the mosses has been curiously neglected, even by the botanist, and had it not been for the work of a few enthusiasts we should know little about them to-day. Yet though they are lowly, and often minute, things that need a lens, and even a microscope, to reveal their full beauties, they make a fascinating study, especially in the winter days, when they are at their best.

And they are everywhere. On each old wall one may find sometimes a wonderful variety of species forming, with their every shade of green and brown and yellow, the 'velvet carpet' of which a poet has sung. On each old roof or

dyke will be the little bosses of *Tortula*, the wall-screw. In the hedges there are the trailing *Hypnum*s, such as the fern-like tamarisk moss. On the banks are the *Bryum*s with the drooping capsules. In the woods are the bushy *Polypodium*s with their yellow starry flowers. On the moors are the white lumps of *Glucobryum*, looking like pale, spiny hedgehogs. On the hills are the bristly *Campylopus*, often red or sooty black, or *Racomitium*, that gives quite a gray look to the landscape where it is plentiful. If you look at it under a strong lens you will see that every long sword-like leaf tapers off into a curling toothed transparent point, and that gives the glassy-gray look to the hill-side. Then there are the *Sphagnum*s of the bogs, spongy things of remarkable beauty, full of water, and of every colour from white to green and bright red. These are a few outstanding types.

They are always there, they need little seeking and no chasing, and all you need for the study of them is a pocketful of bits of paper to enfold each specimen, a lens (or better, a microscope), and perhaps a little book on the subject to identify each species.

And it is a delightful winter and fire-side study. You have only to take out one of your specimens and dip it in warm water to find it as fresh as ever. You can keep them in papers, in little boxes (pill or ointment), or press and mount them on paper. And once you start collecting you will become every day more and more astonished at their species and varieties. You will soon learn to know a sphagnum from a dicranum, and, if you have a microscope, you will find that the preparation of leaf specimens of the different kinds will grip you with a fascination that perhaps no other nature study has the power to do. There are few things more beautiful, when you come to look into them, than the treasures of the poet's 'velvet carpet.'

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

ONE chief enemy of the devil in a disturbed and aggravating world is evidently music. The truth of this serious and considered statement may be granted after short reflection. No doubt exists that since the War, and as the result of it, with its demoralising and disintegrating influences, a serious decline in the state and standard of civilisation has taken place. The extent of this decline is variously estimated, according to whether he who thinks upon it is optimistic and careless, or pessimistic and acutely analytical, but that in some measure it exists is agreed by all. In commercial quarters we are assured that the standard of business honesty has fallen some degrees. Prosecutions for fraudulent proceedings are more numerous than ever before, and the faults are more shameful. Robberies and burglaries are amazing in their number and the rascally boldness with which they are perpetrated. Offences against the social standards have been multiplied enormously; the old social virtues are regarded contemptuously. Night-clubs flourish, and the nobility, the rich, and the merely-foolish are arrested in them in the cold, dark hours of early morning, completing a night's revelries by infringement of Acts of Parliament regarding the sale and consumption of alcoholic refreshments. A large proportion of the population approve of some of these proceedings, being persons whose spirits have absorbed the new tendencies. They are chiefly the young, so young that they have really only begun development since the War, and have never known what it is to be good and nice, and yet not dull nor finding life a stupid show. A decline in civilisation is logically a reaction towards savagery, and as we look on London in these times, brilliant as it is, keen, delightful still in many respects, stimulating, we may see the savage tendencies, the crude barbaric elements of raw animal man at work. The old crust of civilisation is thin indeed. Tall buildings and fine clothes are not the signs of what we mean by civilisation, nor yet the inventions that inflame our wonderment. Science and discovery had reached such a mark that the sudden revelation of a number of Nature's secrets was inevitable, and though the flight of aeroplanes and the transmission

of sounds for long distances through the air were great achievements, in a few years they will be like commonplace conveniences, for, after all, they, with other inventions, are simple applications of natural facts and forces. What are such things compared with my sitting here in London and seeing and talking—just in the way of ordinary tea-time conversation—with a person in New Zealand, with whom I thus switch up at thought?—as may be our privilege and convenience at some not distant time. If sound can travel so easily, sight may do likewise, while mountains and stone walls may be no more impediment for one than for the other. A certain advantage will be presented here; one of our sons' concerns will be to avoid being thus switched upon when wanting privacy. For all the tendencies of life are against the maintenance of any sort of isolation and solitude, delicious as they have been.

* * *

We who live now are the last for a long time who may know how sweet the pleasures of solitude can be. Two years ago I dwelt in the Sahara desert for a short spell of time, and in superbest solitude I would creep from my oasis near the time of sunset out towards the gold horizon, past the last tents of the Bedouins, and with nothing but the endless desert flatness and straightness before me, watch the wide red sun go down, when it seemed that Silence herself called for a greater silence still. But now, there lies upon my table here a pamphlet telling of the conditions of a tourist expedition with regular times of departure across this Sahara desert, right through to Timbuctoo, by ordinary automobiles and others with wheels of the caterpillar kind, a journey that, with camels, not ten years back, was regarded as one of the most dangerous adventures in the world, along a track strewn with the bones of men who had tried and failed, and lain down to die of thirst. The programme here tells me that in the most dangerous and isolated parts of the desert small hotels will be erected, and there will be baths and French cooking for all of us. Likewise there will be jazz bands and cocktail bars. O, sad Sahara now! For future solitude only the poles are left, and hardly the poles since the wireless

transmissions may permeate the uttermost distance and recess. The next man to reach the South Pole may, for his spiritual refreshment after labour, sit him down and listen to the Fifth Symphony of Beethoven projected through the world from Chelmsford. And again, what are our modern wonders compared to our seeing—as one day we may be privileged to see—on the cinema screens real moving pictures, taken from the living original and not from modern actors, of the great events of Biblical history, of Alexander achieving some of his conquests, of Cæsar marching victorious into Rome, of Henry the Fifth at Agincourt, of Christopher Columbus first gazing upon the New World, of Michael Angelo engaged upon great paintings, of Shakespeare busy in the theatres of London? Soon, not long perhaps from now, seeing the speed of advance as the full scientific momentum has been attained, these things may be viewed as realities upon the screen, revived after all the ages of obscurity, because scientists of imagination believe—and it is plainly obvious deduction from known facts and circumstances—that by light and its friends in the world of Nature impressions of all that has ever happened have been made upon the stones and other things about, and it is but a question of recovery. Even easier is it to believe that our early posterity, if not ourselves, will listen in their chambers not merely to music broadcast at the time of its being played at London, Bournemouth, Aberdeen, and sundry other centres, but that they will hear the chanting of the early Christian pilgrims, hear the cymbals, harps, and lutes as they were played in the days of the Old Testament, fresh from that time—not imitations thereof, but the original music. This we may comprehend, since now we understand so much about the waves of sound floating through the ether, their seeming indestructibility, their magical persistence. They linger always in the air, and some day science will extract them all again. For many of our seemingly magical discoveries and inventions we do but work on the simplest and most absolute axiom of science, that nothing is ever destroyed, or made void in the sense of complete non-existence, nor can be. What has been is, and remains, though there may be transmutations, and in that is all the hope and all the fear for the future.

* * *

But in all such wonder and advancement, where then the supposed savagery and the tendency to it, and where the reforming influence of music? It seems that the whirling stress of present life and the intoxication of amazing change have much disturbed the balance of the human mind, already upset by four years of bloody horror, and reaction towards a certain measure of barbarism may be natural and inevitable. It may even be bene-

ficial, if it advances not too far. Next we observe that music, and what we regard as good music, is in vastly greater demand and supply to-day than ever before. Here are two prime facts, presenting a high significance. A thousand persons know and listen to the works of Beethoven, Mozart, and Elgar for each one who knew and listened only ten years ago. They may listen to them in that lonely desert; even the Bedouins may hear them. Music is being flung through every inch of space in either hemisphere, and caught upon every spot on land and by the ships at sea. I was coasting down African waters in a tiny steamer not long ago, and we used to listen to the bands being played in Paris. Some sort of music is saturating all the world. The gramophone and the radio broadcasting have done it, and by much hearing the people are beginning to understand and sympathise; they can appreciate differences and appraise an excellence. Now, we should not regard this new universal vogue of music as a merely adventitious happening. We see mankind, having been strained too much with pain and with excitement, losing its head and tumbling towards demoralisation and savagery, and at this crisis the world is strewn with music, all the sweetest, finest music. All the people who before had listened only to crude brass bands and tunes, hear now the noble and delicious compositions of the masters. It is true that the high people of music, they who have known and understood it all the time, and have been finely cultivated in theory and practice—some of whom are called 'high-brows,' because they disdain what the people love, and devote themselves to intricate profundities—deprecate this circumstance because, as they would say, firstly, it is not music, and secondly, it is vulgar. Such is their peevish way, but it matters little. It has the effect of music. Music differs from the other arts in the intensity of its temporary effects upon the human mind. It is an anodyne; it is a benevolent drug. Lovers of pictorial art, with discrimination and taste finely trained, rarely feel a beating of the heart when gazing upon a masterpiece, and more seldom is their vision blurred by tears of emotion. Yet music often draws the tears. It sucks them to the eyes of emotional men and women who have stood taut against the tenderest and most pathetic passages in novels and plays to which others have succumbed. When the war was waged what onlooker did not feel his pulse to leap and beat when soldiers were marching through the streets with the drum and fife ahead of them, expressing the most infinite pathos through the shrillest of sounds? So now we say that the savagery of modern life, or the tendency to it, is being counteracted by this anodyne, universally spread over the world at the moment when most needed, soothing it and purifying. And so that

old tag of Congreve, after all its long, unthinking, hackneyed use, comes up with a new truth brilliantly displayed—'Music has charms to soothe a savage breast.' And it is enticing people back to homes they had deserted, so that they may listen to it—'listen in.' That in itself is a tremendous movement. It soothes them there after the rack and strain outside. This anodyne will work on all. I surmise that even certain burglars might hesitate amid their burgling were the right music played to them at the moment of their operations, though a simple spoken homily in parsonic vein would fail. It is the great tranquilliser.

* * *

Here we have a revolution. Being spiritual, affecting profoundly the nature of the people, and not merely assisting them in convenience and hurrying on their lives, it is of enormous potentiality. This sweetening of the human spirit of the masses, the new dominating interest flooded through their minds, the enticement back to home, may prove to be a revolution of greater consequence than those prepared by politicians. You cannot unceasingly pour the sweet sounds of Bach and Mendelssohn upon the human spirit, however simple it may be, without some notable result. The higher musical people may regard it with disdain, but once they, too, were among the ignorant. The education of the music-lover is like a set of flashes. He listens to the loud broadcasting, then he wishes for repetition upon the gramophone, and more and more until to his awakening sense the inner meanings and beauties of compositions reveal themselves. Then he reads, and he must attend good concerts. Soon the day comes when he must study and play some instrument himself. More cheap violins have been sold to the common people, determined to teach themselves to play, during the last three years than in the previous thirty. Near to my dwelling is a workshop, and, my window open, I hear all the day one of the men whistling parts of many famous compositions. Opposite my door is a church, and on Tuesdays the knowing vicar holds a chamber concert for four stringed instruments for an hour from one o'clock, deserving his reward; while on Fridays at the same hour there is always an organ recital. The people want more music, and they ask for it everywhere. The superior musicians in their hearts dislike the invasion of the common people. They themselves sheer away into unexplored regions, leaving old favourites and masters behind. A musician of great culture and keen prejudice assured me the other day that now as not before he regarded Beethoven's *Kreutzer* Sonata as rubbish, and he named many others of the popular classics in the same contemptuous way, while it appeared that of recent years, since gramophones began, melodies have made him sick. He is one of

many. The critics and the explainers would rather peer into some question of a dominant eleventh, or search for an inaudible fault in playing, than tell of the meaning of the themes, the relation of the parts, their qualities and effect. They have little to say of the composers now; only what they themselves would do. But the common people, like myself, are attracted by the explanations of the inspirations and meanings and constructions of the old masters, as set forth on the programmes of the Promenade Concerts at the Queen's Hall, which are the most delightful feature of the late summer and early autumn season in London.

* * *

What the people desire is to feel the human side of music, feel it in their hearts and souls, and the exclusivists have wandered off into their new country, disdaining all as they attach themselves to intricacies and discordant depths. The people like better to hear little tales about the great composers, telling of their temperaments, their weakness and strength, inspirations and influences. Now they know well the music of Grieg's *Peer Gynt*, and they are interested in the personality of this genius who could suggest the wild fantasies of semi-barbarism so finely, refining his compositions in a hut he had made for himself some distance from his house, where he could not be pestered by his friends—though certainly the common folk did sometimes creep up to this retreat and listen through the cracks to the delights being prepared within. Nor do the people miss the point that this man, whose music takes our fancies to the mountains, had for grandfather Alexander Greig, of Aberdeen, who, after '45, left his native land for Norway and varied the spelling of his name. They like to hear again of Schubert—whom they took to heart when *Lilac Time*, the play with Schubert's songs, was done in this country—filled with music almost every minute of his thirty-one years of life, singing, singing all the time, and always so much held by his own songs being made within him that he could compose his lovely serenade while watching a game of skittles and write down the notes on a scrap of paper. And now that the people know and understand the dreamy beauty of *L'Après-midi d'un Faune* they must reflect upon Debussy as the wonderful lover of Nature, understanding the nuances of her moods most marvellously. In the days before these people found their new delight they used to think there was in Nature no sort of music, only loud sounds at times like thunder, or the moaning of the wind. But just as he who, in ripe years, first toying in the country with a box of paints, the trees and the hills, the stream and the silver road before him, discovers the enchanting variety and fascination of Nature's colour and her shapes, so shall our new music

lovers hear the sweet sounds of Nature as not before, feeling that the crooning of the breeze through summer leaves of trees, while a linnet takes the solo in this divine concerto, or the soft ripple of a rill, is as music of the gods. Fritz Kreisler, the enrapturing violinist, the other day had something to say of Nature's music that caught our fancy. He spoke of the wind being the tonal background of much of Nature's music; its song, he said, murmurs of joy as it glides through the fields of corn. The most beautiful of all music, thinks Kreisler, is the song of the forest. He would repose among the pines for long and long, and would hear the wind singing through, while the birds were piping and the insects droned their tune. But Kreisler is not attracted by the sound of the sea, which is strange, though he explains what almost is an antipathy. But surely the moan and the roar of the waves, telling of the infinite with pathetic grandeur, is as the greatest of all music.

* * *

The inclination of the people seems to tally with a certain general movement in the world of art. Signs are shown of a coming return to sweet simplicity, abandoning all the discordant eccentricities favoured by certain sects in art. The election of Sir Frank Dicksee to the presidency of the Royal Academy the other day was a token of great importance, for he is no faddist or eccentric, no obscurist of any kind, but one who catches at charms in human life and paints them for his pictures. In music the people love melody, and they shall have melody. More and more lovely melody will be composed. The 'high-brows' scarcely like it. Had they dared, their supporting critics would have said slighting things about the music of Puccini when he died a few weeks back, this wonderful Italian who gave more pleasure and delight to people everywhere than did any

government of any country in his time. One is inclined to think that more have been led from a desert of ignorance and indifference into the enchanted palaces of great music by Puccini than through any other influence, because in their vacuity, yet with vigilant perceptions, they have delighted in *Madame Butterfly* and *La Bohème*, and thence have passed to other and less delicate opera. Those two, with *La Tosca*, were, by general feeling, Puccini's greatest work, and he must have been over-estimating his inspiration when once he said that he had enough music in his head for forty more operas, could he only get the right libretti. More ponderous and weighty, there was surely something missing in *La Tosca* that was contained in the other two favourites; and what was it? What drew the people to *Butterfly* and *Bohème*, sometimes without their exactly knowing why, was the remarkable atmospheric effects that the composer gained. The peculiar haunting pathos that begins immediately with *Butterfly* and runs through it all, establishing the scene, the sense, the tragedy, and the strange sad charm exactly, is bewitching. It is an effect that one might have thought was gained accidentally and could not be repeated, but Puccini had done it before in *Bohème*, catching the true tone of poignant sweetness just the same, but in another key, suited better to Montmartre than to Japan. Puccini with melody, though dead, might be elected as a first president in the new world of music the people now have entered. The loftiest set will say these times that Verdi with so much simple melody is poor, but the people must have *Aida* all the time. But observe that, liking music written and played *noblemente*, they are sound for Elgar always. The people have great sense, and art is nothing if not sense, however subtle the expression of it all.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER VII.—*continued.*

EVER since she had heard that the Laird of Crask was coming to dinner, Janet Raden had looked forward to this occasion as her culminating triumph. He had been her confidant about the desperate John Macnab, and from her he must learn the tale of her victory. Her pleasure was increased by the consciousness that she was looking her best, for she knew that her black gown was a good French model, and well set off her delicate colouring. She looked with eyes of friendship on him as he limped across the room, and noted his lean distinction. No other country, she thought, produced this kind of slim, graceful, yet weathered and hard-bitten youth.

'Do you know Mr Claybody?'

Johnson Claybody said he was delighted to meet his neighbour again. 'It's years,' he said, 'since we met at Ronham. I spend my life in the train now, and never get more than a few days at a time at Haripol. But I've managed to secure a month this year to entertain my friends. I was looking forward in any case to seeing you at Muirtown on the 4th. I've been helping to organise the show, and I consider it a great score to have got Lamancha. This place has never been properly worked, and with a little efficient organisation we ought to put you in right enough. There's no doubt Scotland is changing, and you'll have the tide to help you.'

Mr Claybody was a very splendid person. He looked rather like a larger edition of the great Napoleon, for he had the same full fleshy face, and his head was set on a thickish neck. His blonde hair was beautifully sleek, and his clothes were of a perfection uncommon in September north of the Forth. Not that Mr Claybody was either fat or dandified; he was only what the ballad calls 'fair of flesh,' and he employed a good tailor and an assiduous valet. His exact age was thirty-two, and he did not look older, once the observer had got over his curiously sophisticated eyes.

But Sir Archie was giving scant attention to Mr Claybody.

'Have you heard?' Janet broke out. 'John Macnab came, saw, and didn't conquer!'

'I've heard nothing else the last two days.'

'And I was right! He is a gentleman.'

'No? Tell me all about the fellow.' Sir Archie's interest was perhaps less in the subject than in the animation which it woke in Janet's eyes.

But the announcement that dinner was served cut short the tale, though not before Sir Archie had noticed a sudden set of Mr Claybody's jaw and a contraction of his eyebrows. 'Wonder if he means to stick to his lawyer's letter,' he communed with himself. 'In that case it's quod for Charles.'

The dining-room at Strathlarrig was a remnant of the old house which had been enveloped in the immense sheath of the new. It had eighteenth-century panelling, unchanged since the days when Jacobite chiefs in lace and tartan had passed their claret glasses over the water, and the pictures were all of forbidding progenitors. But the ancient narrow windows had been widened, and Sir Archie from where he sat had a prospect of half a mile of the river, including Lady Maisie's Pool, bathed in the clear amber of twilight. He was on his host's left hand, opposite the professor, with Agatha Raden next to him; then came Junius, while Janet was between Johnson Claybody and the guest of the occasion.

Mr Claybody still brooded over John Macnab. 'I call the whole thing shameless impertinence,' he said in his loud assured voice. 'I confess I have ceased to admire undergraduate "rags." He threatens to visit us, and my father intends to put the matter into the hands of the police.'

'That would be very kind,' said Janet sweetly. 'You see, John Macnab won't have the slightest trouble in beating the police.'

'It's the principle of the thing, Miss Raden. Here is an impudent attack on private property, and if we treat it as a joke it will only encourage other scoundrels. If the man is a gentleman, as you say he is, it makes it more scandalous.'

'Come, come, Mr Claybody, you're taking it

too seriously.' Colonel Raden could be emphatic enough about the rights of property, but no Highlander can ever grow excited about trespass. 'The fellow has made a sporting offer and is willing to risk a pretty handsome stake. I rather admire what you call his impudence. I might have done the same thing as a young man, if I had had the wits to think of it.'

Mr Claybody was quick to recognise an unsympathetic audience. 'Oh, I don't mean that we're actually going to make a fuss. We'll give him a warm reception if he comes—that's all. But I don't like the spirit. It's too dangerous in these unsettled times. Once let the masses get into their heads that landed property is a thing to play tricks with, and you take the pin out of the whole system. You must agree with me, Roylance?'

Sir Archie, remembering his part, answered with guile, 'Rather! Rotten game for a gentleman, I think. All the same the chap seems rather a sportsman, so I'm in favour of letting the law alone and dealing with him ourselves. I expect he won't have much of a look in on Haripol.'

'I can promise you he won't,' said Mr Claybody shortly.

Professor Babwater observed that it would be difficult for a descendant of Harald Blacktooth to be too hard on one who followed in Harald's steps. 'The Celt,' he said, 'has always sought his adventures in a fairy world. The Northman was a realist, and looked to tangible things like land and cattle. Therefore he was a conqueror and a discoverer on the terrestrial globe, while the Celt explored the mysteries of the spirit. Those who, like you, sir—he bowed to Colonel Raden—'have both strains in their ancestry should have successes in both worlds.'

'They don't mix well,' said the colonel sadly. 'There was my grandfather, who believed in Macpherson's Ossian, and ruined the family fortunes in hunting for Gaelic manuscripts on the continent of Europe. And his father was in India with Clive, and thought about nothing except blackmailing native chiefs, till he made the place too hot to hold him. Look at my daughters, too. Agatha is mad about poetry and such-like, and Janet is a bandit. She'd have made a dashed good soldier, though.'

'Thank you, papa,' said the girl. She might have objected to the appellation had she not seen that Sir Archie accepted it with admiring assent.

'I suppose,' said old Mr Bandicott reflectively, 'that the War was bound to leave a good deal of unsettlement. Junius missed it through being too young—never got out of a training camp—but I have noticed that those who fought in France find it difficult to discover a groove. They are energetic enough, but they won't stay put, as we say. Perhaps this Macnab is one of the uprooted. In your country,

where everybody was soldiering, the case must be far more common.'

Mr Claybody announced that he was sick of hearing the War blamed for the average man's deficiencies. 'Every waster,' he said, 'makes an excuse of being shell-shocked. I'm very clear that the War twisted nothing in a man that wasn't twisted before.'

Sir Archie demurred. 'I don't know. I've seen some pretty bad cases of fellows who used to be as sane as a judge, and came home all shot to bits in their mind.'

'There are exceptions, of course. I'm speaking of the general rule. I turn away unemployables every day—good soldiers, maybe, but unemployable—and I doubt if they were ever anything else.'

Something in his tone annoyed Janet. 'You saw a lot of service, didn't you?' she asked meekly.

'No—worse luck! They made me stick at home and slave fourteen hours a day at controlling cotton. It would have been a holiday for me to get into the trenches. But what I say is, a sane man usually remained sane. Look at Sir Archibald. We all know what a hectic time he had, and he hasn't turned a hair.'

'I'd like you to give me that in writing,' Sir Archie grinned. 'I've known people who thought I was rather cracked.'

'Anyhow, it made no difference to your nerves,' said Colonel Raden.

'I hope not. I expect that was because I enjoyed the beastly thing. Perhaps I'm naturally a bit of a bandit—like Miss Janet.'

'Perhaps you're John Macnab,' said the lady.

'Well, you've seen him and can judge.'

'No. I'll be a witness for the defence if you're ever accused. But you mustn't be offended at the idea. I suppose poor John Macnab is now crawling round Strathlarrig, trying to find a gap between the gillies to cast a fly.'

'That's about the size of it,' Junius laughed. 'And there's twenty special correspondents in the neighbourhood cursing his name. If they get hold of him, they'll be savager than old Angus.'

Mr Bandicott, after calling his guests' attention to the merits of a hock which he had just acquired—it was a Johannisberg with the blue label—declared that, in his belief, the War would do good to English life, when the first ferment had died away.

'As a profound admirer of British institutions,' he said, 'I have sometimes thought that they needed a little shaking up and loosening. In America our classes are fluid. The rich man of to-day began life in a shack, and the next generation may return to it. It is the same with our professions. The man who starts in the law may pass to railway management,

and end as the proprietor of a department store.

'Our belief is, that it doesn't matter how often you change your trade before you're fifty. But an Englishman, once he settles in a profession, is fixed in it till the Day of Judgment, and in a few years he gets the mark of it so deep that he'd be a fish out of water in anything else. You can't imagine one of your big barristers doing anything else. No fresh fields and pastures new for them. It would be a crime against Magna Charta to break loose and try company-promoting or cornering the meat trade for a little change.'

Professor Babwater observed that in England they sometimes—in his view, to the country's detriment—became politicians.

'That's the narrowest groove of all,' said Mr Bandicott with conviction. 'In this country once you start in on politics you're fixed in a class, and members of a hierarchy, and you've got to go on, however unfitted you may be for the job, because it's a sort of high treason to weaken. In America a man tries politics as he tries other things, and if he finds the air of Washington uncongenial he quits, and tries newspapers, or Wall Street, or oil.'

'Or the penitentiary,' said Junius.

'And why not?' asked his father. 'I deplore criminal tendencies in any public man, but the possibility of such a downfall keeps the life human. It is very different in England. The respectability of your politicians is so awful, that when one of them backslides every man of you combines to hush it up. There would be a revolution if the people got to suspect. Can you imagine a Cabinet Minister in the police court on a vulgar charge?'

Professor Babwater said he could well imagine it—it was where most of them should be; but Colonel Raden agreed that the decencies had somehow to be preserved, even at the cost of a certain amount of humbug. 'But excuse me,' he added, 'if I fail to see what good an occasional sentence of "six months' hard" would do to public life.'

'I don't want it to happen,' said his host, who was inspired by his own Johannisberg, 'but I'd like to think it *could* happen. The permanent possibility of it would supple the minds of legislators. It would do this old country a power of good if now and then a Cabinet Minister took to brawling and went to jail.'

It was a topic which naturally interested Sir Archie, but the theories of Mr Bandicott passed by him unheeded; for his seat at the table gave him a view of the darkening glen, and he was aware that on that stage a stirring drama was being enacted. His host could see nothing, for it was behind him; the professor would have had to screw his head round; to Sir Archie alone was vouchsafed a clear prospect. Janet saw that he was gazing abstractedly out

of the window, but she did not realise that his eyes were strained, and every nerve in him excitedly alive. . . .

For suddenly into his field of vision had darted a man. He was on the far side of the Larrig, running hard, and behind him, at a distance of some forty yards, followed another. At first he thought it was Leithen, but even in the dusk it was plain that it was a shorter man—younger, too, he looked, and of a notable activity. He was gaining on his pursuer when the chase went out of sight. . . . Then Sir Archie heard a far-away whistling, and would have given much to fling open the window and look out. . . .

Five minutes passed and again the runner appeared—this time dripping wet—on the near

side. Clearly not Leithen, since he wore a white sweater, which was a garment unknown to the Crask wardrobe. He must have been headed off up-stream, and had doubled back. That way danger lay, and Sir Archie longed to warn him, for his route would bring him close to the peopled appendages of Strathlarrig House. . . . Even as he stared he saw what must mean the end—two figures appeared for one second on the extreme left of his range of vision, and in front of the fugitive. He was running into their arms!

Sir Archie seized his glass of the blue-labelled Johannisberg, swallowed the wine the wrong way, and promptly choked.

(Continued on page 220.)

THE GREY FRIARS GARDEN.

By M. M. M'PHERSON.

JUST seven centuries ago, a monk of Pisa was sent on a mission to England by St Francis of Assisi. He and his companions arrived at Canterbury in due course after various adventures; and, with the permission of Archbishop Stephen Langton, the Little Brothers subsequently founded the Grey Friars Monastery.

The very small portion which Time and the Reformation have left of this religious house is now completely hidden behind ordinary buildings in Stour Street. It is very courteously shown, however, to any interested and curious visitors who penetrate the yard-gate into the charming garden in which it is situated. Across this can be seen a very old bit of wall—the remnant of a still more ancient hospital. It was just outside this building that the Brothers pitched their tents in 1224, and watched the construction of their own monastery. Their strict vow of poverty precluded them from owning the land allotted to them, or the house which was built thereon; but the matter was arranged by the monks of Christchurch assuming possession, and accepting the Franciscans as tenants.

There they peaceably lived and studied, worked and prayed, in these lovely surroundings until Henry VIII. quarrelled with the Pope, seized the monasteries, and confiscated to his own uses such treasures as his emissaries discovered therein.

Later on, in the seventeenth century, the property came into the hands of Colonel Richard Lovelace.

A long narrow path bordered with fruit-laden apple and pear trees leads to the entrance. A branch of the river Stour flows gently on one side between bricked-up banks. A gay fringe of nasturtiums was in bloom on one side when the present writer visited the spot, and the

flowers and tendrils hung over the edge, peeping into the quivering mirror. On the farther bank a corresponding path wound along the island, flanked by a well-tended herbaceous border.

The most substantial remains of the monastery are carried right across the stream on brick arches, a curious method of construction, suggesting a mill rather than a dwelling-house—unless, indeed, it was merely the unassuming gatehouse which led to more important buildings, of which there are ample traces on the island at the back.

A door under a pointed arch gives access to a narrow passage. On one side of this a good-sized room is shown, which tradition describes as the refectory. Until thirty years ago it was inhabited by cottagers, and the recessed cupboards, wooden dado, and stove are all of the most obviously modern workmanship.

On the other side of the passage, at the end of the little building, is an ancient door of solid reddish-hued wood. It is beautifully made, the upper panel opening to reveal an inner slatted panel. This gives access to the monks' kitchen, where the deep embrasures of the diamond-paned windows show the thickness of the stone walls. In the floor is a square trap-door, which, when raised, reveals the river flowing beneath. Here the monks cunningly fished at their ease, whatever the weather. And there could be no doubt about the freshness of their fare, for it was literally just one leap from the water into the pan!

The room over the refectory, supposed originally to have been the monks' dormitory, is very lofty, with massive beams and rafters. In the days of the gay Cavalier another flooring was added, and the upper portion served as his sleeping apartment. This has now been removed, but a fireplace half-way up in the wall

is still visible. Richard Lovelace used it as his sitting-room. The outlook from this chamber is ideally inspiring for a poet. At the end of the garden the narrow river is spanned by two bridges. The first is a simple wooden affair; the second, of warm red brick—almost completely veiled by brilliantly-tinted virginia creeper—is said to have been built by the Grey Friars to enable the townsfolk to get round to their chapel on the island. And then, above and beyond the steep tiled roofs of houses, the cathedral towers rise finely, closing in the view.

Above the kitchen at the back is a much smaller room, where an interesting photograph, taken from a portrait of Agnellus, the founder of the monastery, was shown. Subsequent to the writer's visit, the seven hundredth anniversary of this monk's arrival was commemorated, with much form and ceremony, by the Roman and Anglican churches, on 10th September 1924.

Returning to the ground floor, we passed out through the back door at the end of the passage; above this we observed traces of a Norman arch filled in at a later period with a smaller Gothic

one. Foundations of other buildings were to be seen outside. One ancient wall still showed a fine Norman arch built up into it, which had been the west entrance of the monks' chapel. On either side of this were curious square apertures, through which tradition avers that offerings made to the monks were thrust.

Skirting what is now a kitchen-garden, we passed under an exquisite little arch, which Lovelace is said to have found and set up. And one thought of how he must have walked along the paths of this pretty garden, musing over and perhaps actually composing the famous lines by which he is remembered:

Stone walls do not a prison make,
Nor iron bars a cage;
Minds innocent and quiet take
That for a heritage.

Franciscan monastery, Cavalier's dwelling, cottagers' home, what vicissitudes have these old walls witnessed!

But the garden is still blooming, and the influence of the learned monks upon the intellectual life of Britain remains to this day.

ALCESTIS AND ARIADNE.

By ALAN SULLIVAN, Author of *Man's Work*, &c.

I.

IT came toward me, dancing across the Round Pond with miniature dignity, the most perfect model of a ship I had ever seen. At the same time there approached, walking along the bank, a miniature man. He was not more than five feet tall, and carried a bamboo with a rubber tip. The model glided shorewards, tilting delicately to a varying breeze, a flat furrow broadening from its slender forefoot. The little man put out his stick, and turned his craft till the wind fluttered in her pigmy sails. Then, lifting carefully, he laid her on her side, the bamboo under her glossy bilge.

A certain ritual is observed by those contemplative adults whose vessels navigate the Round Pond. They are weatherwise in small compass. They are masters of rig and design. Shroud and spar, bobstay and topping lift, tafferel and boom, they recreate all these. They study clearance, displacement, and friction. Winter evenings are lovingly given to those perfect hulls that, later, will cleave their liquid passage through the bizarre flotilla of Kensington Gardens.

When I looked again at the little man, I seemed to understand why it was that this barquentine of his was the real thing. He had a face of soft leather, and eyes like bits of the blue sky that hung that day over London. His clothes, too, were blue, with a sort of square,

topsail cut to the coat. More leather in his throat, round which a blue tie was loosely knotted. He stood with his feet rather far apart. Then he looked at me, and felt for his pipe.

'Good bit of work, that,' I ventured.

He nodded. 'Not bad; but my fingers are getting stiff. She'll pass—for eighty.'

'Eighty what?'

'I'm eighty.' He grinned reflectively. 'You, I suppose, are about half that?'

'Yes,' I said. 'But you don't look it.' The queer thing was that he did—and didn't. I couldn't imagine him any older or younger. He might go on being eighty indefinitely.

'Well, ages interest me in a way. Always did. When a man quits feeling, and goes on just remembering, he don't age so quickly. At least, that's how I see it.'

'Is that a model of a vessel you sailed?'

He slapped his thigh. 'That's her, keelson to pennant. Southern Cross Line; China tea trade. Ever hear of *Cutty Sark* and *Thermopylae*?'

'Yes—famous ships.'

'Ever hear of *Alcestis*?'

'I don't think so.'

'No; I guess not. Nobody did, except those in the trade. I sailed her. She was a wash-out long ago. Coal hulk at Devonport. Saw her last year, and it made me sick.'

'I can understand that.'

He pointed. 'That companionway led to my cabin. I've put in the right number of steps. Ought to know after ten years of 'em. That's her rig to the last ratline. Ought to know that, too. We couldn't foot it with *Thermopylae* or *Cutty*, but our average wasn't much under. Those two were something more than ships. Over-rigged, both of 'em, and something in their lines—I don't know what—but anyway they didn't pull any water after 'em. That's where they got the speed; mostly in the clearance. More important, you know, than the lines forward. But, of course, you don't know. Hardly any one does.'

This was rather too much for me. 'It must have been a lonely life,' I hazarded.

'Queer you should say that. I just begin to see how lonely it was. My God!' He pulled down his brows. 'The sea takes everything, but never gives anything back. One's apt to forget that, specially in the tropics, till suddenly you're fetched up short—all standing. Lonely—yes—you're right enough.'

He pushed a horny forefinger into his pipe, seeming to drop me out of his mind, while through half-closed lids he stared musingly at the sleek hull of the *Alcestis*. I wondered if his ship—the real one—had played fair with him; or whether, by rebuilding her in the evening of life, he revived something, to the vision of which he still clung. Then he struck a match, sucked, and looked at me through a faint blur of smoke. His eyes were gray, now, not blue.

'Care to know?' he asked quietly.

'Whatever you like to tell me.'

II.

He lifted the *Alcestis* back on to the grass, and squatted beside her. It wasn't till then that I noted the seaminess of his skin, divided up into countless little tablelands, intersected by a criss-cross of fine, deep lines.

'Of course,' he said, 'I used to think it unusual, but it may not sound unusual to you. That's the effect of the sea. Every sailorman thinks he has found something on salt water—or in it—different from the other fellow. But when you boil them down, all these discoveries are the same. Does that sound like sense? Can you make anything of it?'

'Yes.'

'Well, I didn't fathom it till I came ashore for good, fifteen years ago. The reason is that when you're on blue water, you just naturally think backwards. So I used to think a lot about St Mawes, where I came from—it's across the harbour from Falmouth—and Thorpe, Jeff Thorpe. He came from there, too, and went to sea when I did. It was always nip and tuck between us. And there was a girl. I'm coming to her later.

'Jeff got his ship the same week as I got

Alcestis. We started from the Pool of London the same week, and cleared, hell for leather, for Shanghai. *Red Jacket*—you may have heard of her—showed us her heels in the Bay. I didn't care much; we weren't in her class, and I'd fixed it with my girl—her name was Mercy Burns, no harm in telling you that now—that we'd be married when I got back. Jeff knew it, and though we were often in sight on the early part of that voyage, he never answered a signal. I'd met him the week we sailed, passed the time of day, and he told me to go to hell.'

My friend was silent for a moment, and I pictured those two under their dipping yards, squinting across a league of blue-black sea at well-known sails that fitted like a gull's wing beneath the Southern Cross, each of them hungry for the same woman, each guided by the same star.

'What sort of a man was Thorpe?'

His glance roved along the flat shore of the Round Pond. 'Like that chap on the other side. Bigger than me, curly hair, and a sort of restless devil in his eyes. Women liked him, while they didn't cotton much to me. His laugh would make any one laugh. He was my match on salt water, too. That must have been a queer voyage for him, though he had the best of it, and was clearing Shanghai, stuffed with tea to his hatches, when I worked up the river. I took over his pilot. Even then he didn't wave a hand. *Ariadne*, his ship—a big barque—couldn't have been more than a couple of cables off.'

'And then?'

'I made the Thames in seventy-five days, my record, and was a week behind him. Dropped my hook in Upper Barking Reach, put in my papers, and started for St Mawes. Again a week too late. Mercy had gone off with Jeff. I found afterwards *Ariadne* was lying round the bend above me, and had put to sea the day after I made port. She went out with the tide, and my first mate saw a woman on the poop.'

His voice lowered and became curiously gentle. 'That's where she sat,' he went on, touching a brass tack driven into the deck of the model—'and now I like to think of her sitting there, because she must have been happy while it lasted. Anyway, that was her answer to me. I chewed it over, hating Jeff more and more every minute, and my crew had a hard time that trip till we picked up *Ariadne* on the edge of a big calm in the Indian Ocean. She lay a couple of miles ahead, sails flapping. I couldn't move, either. Hot as hell. Queer, eh, that we three should come together like that?'

I nodded, while Kensington Gardens faded away. The creaking of slack blocks came to me; the vision of tall spars tracing irregular outlines against a purple sky; yellow decks, in

whose seams the tar lay soft and sticky; the glare of a smiting sun; the flat plain of sea, empty, and rimmed by the hard bowl of sky; the ships' companies, sweltering, every man of them in full possession of the facts—for there are few secrets between rival ships; the jokes in the fo'c'sle; my friend's thoughts when night came and the *Ariadne's* lights blinked through the dusk; the passion, the hunger, and the torture. I stole a look at him. Had he been through all this?

III.

'At midnight,' he went on slowly, 'I ordered my gig, then ordered it back. You see there had been no signals, and I would only have made a damned fool of myself, and I couldn't do that before the crew. Within the next hour the bottom fell out of the glass, and I knew we were in for it. Generally the way after those calms. Jeff would know too, being as good a man as myself. And Mercy's life was in his hands. The next time I saw *Ariadne* was in a flash of lightning, running like hell under triple-reefed mainsails. The storm had begun in earnest. I suppose you've read about them?'

'Yes.'

'Then I'll leave out a good deal, except that this was a typhoon. It picked up columns of the Indian Ocean hundreds of feet high, chopped 'em off at the bottom, and let 'em drop. There wasn't so much sea, at first, because the weight of wind had beaten it flat. The sea came afterwards.'

He paused, thumbing one of the shrouds of the *Alcestis*, as though uncertain how much more to leave out. No excitement in his voice, but a slow deliberation. He might have been seeing it all again from a distance.

'How did the *Alcestis* take it?'

'She took it, but that's all. I was thinking of *Ariadne*. Never saw her again.'

'What?'

'Never saw her again,' he repeated quietly. 'Four days later the storm had blown itself out, and *Alcestis* was lying on the water like a wet spaniel lies on the bank, panting. Most of our canvas had gone, and I was rigging spares, when we sighted a boat. Jeff was in it, and three men, and Mercy. She was dead.'

His words trailed out, and I didn't speak. There were more tiny vessels on the Round Pond now, with a stiffer breeze; and I tried to magnify them to such dimensions as would enable me to visualise in some fashion what I had just heard. The little man, too, stared at the pond, and his lips moved.

'I hope you won't mistake my talking like this. You see I'm happy now—honestly; otherwise I wouldn't have said a word. It's so long ago, and I've seen so much since. None of us can tell when the blow is coming, so we can't prepare, and when it does come we think

it's the end of everything. But it isn't—and it took me thirty years to find that out. I told you the sea takes everything and gives nothing back. Well, that's true. It wasn't till I left the sea that things came right again. And it happened on the Round Pond.'

'I'm glad of that,' I said.

He nodded. 'Perhaps I'm giving it to you the wrong end first; but I rather wanted to, so that you would understand what I'm going to tell you now. We picked up that boat, and Jeff and I stared at each other. There was nothing to be said across that girl's body. She'd had what she wanted, at any rate some of it, and so had Jeff. I was no part of it. But if it hadn't been for him she'd have been alive and well that minute—my wife on my ship. That was in his mind too. I could see it in his eyes. God—how he must have suffered; and I was glad. Then I buried her in the deep sea. But it was to me she had come back, and he sat with his head between his hands for days. I used to curse him aloud before the ship's company, and he never said a word. I'm sorry for that now. That other tack in the deck is where she lay.'

IV.

I wondered why he told me all this. He seemed a strangely gentle repository for hate and revenge. Wind and weather and solitude in great spaces had refined the fibre of him—or perhaps it was always fine—so that his appearance had on me a certain cleansing, invigorating effect, and I wanted to feel bigger and better for having met him. An hour with him, to judge by all that was outward, should be, in a way, enfranchising, and put me in tune with finer things than one ordinarily supplies for oneself. Yet there he sat, breathing enmity and bitterness, while with a manner in which there was nothing short of love he fingered the slim body of the *Alcestis*.

'Of course,' he went on, as though communing with himself, 'you'll see why I built this model. I didn't do it till after I had quit the sea for some years, and then it took a good while. You can't hurry over this sort of work, and I had nothing else to do. Queer effect it had, because a million things came back that I thought I had never known. Just like something inside me saying, "Stop, you blasted fool, you've forgotten something." It got so real that after a while I felt like a miniature man myself, and could walk this deck and look up at these spars and think how tall and straight they were. Then I'd come back to myself—I mean my right size—and get to work again.'

He touched the *Alcestis* amidships. 'That's where Jeff used to sit, all day and most of the night. He shared the mate's cabin. Anything I had to tell him I sent word by a boy or the mate. He did the same. The mate didn't ask

any questions, for he knew better. And besides, he knew. They all knew. Time and time again I used to see Mercy's face just under the water, or following the ship, and from the way Jeff looked he saw it too. But we never spoke. I landed him at Singapore, put in my statement about the rescue and all that, then cleared for Shanghai. Jeff got a passage home in another Southern Cross clipper.'

'And you didn't say good-bye?'

'Not a word. I used to hear whispers saying that I was dead wrong and couldn't judge others; but when the water under you is three miles deep, you're apt to hear lots of voices you don't pay any attention to. Anyway, I didn't.'

'And after that?'

'Mercy seemed to sail with me every voyage. When the weather allowed, I used to set my course for a certain spot I had pricked on the chart; and if we passed over it at night I used to take the wheel myself and manage to send the watch below so as to be alone on deck for just a minute. *Alcestis* seemed to know it by the way she acted, giving a little shiver to her spars, so to speak, and footing it very gently and carefully, and never the whine of a block or the shake of a single sail. Ships have souls, right enough. Of course, I used to hear about Jeff. He stayed with the line. I sighted him sometimes—he had *Calypso* then—but we left each other alone. I saw his name on the company's pay-roll—he was getting the same pay as myself—and passed him in Wapping High Street more than once. But we hadn't anything to say. Then about six years later it was my turn to be picked up.'

'Wrecked?'

He nodded. 'Nobody's fault. Cargo of tin from the Malay States. Got into a big blow, cargo shifted, strained my hull, and down she went. Not a hundred miles from where *Ariadne* sank. Jeff found us, the last man in the world I wanted to do it. He saw that the minute I stepped on board. Nothing said between us. It doesn't seem possible now, but it's true. He motioned to his cabin, but I wouldn't go, and shared the mate's. It was hell for the rest of the voyage. Before that I'd been alone with Mercy, you understand; but now I was locked up with the man who stole her and lost her. Of course his story had followed him, just as mine did me. No escaping that on the high seas. And there was a sort of triumph in his eyes when he dropped his hook in the Thames. He was even then on the rescue business, anyway. I hated him the more for that. I actually did.'

V.

I knew by the mild light in his face, and the kindness lurking in the corners of his lips, that hate had now been altogether done away with. He radiated benignity. But whether it

had been knocked or coaxed out of him I could not tell. I think by the way he deliberated over the rest of the story he must have rather enjoyed my uncertainty, for he had time to make a careful adjustment of the *Alcestis*'s steering-gear before he spoke again.

'Well, we criss-crossed the sea for years—it was steam by that time—as long as we were good for it, and stepped ashore during the same autumn. Both comfortably off. Retiring pension, you know, and a bit saved. Then, after I'd got settled in the new life, I began to see things in a new way. I couldn't hate as before. The trouble with the sea is that you can't forget anything while you're on it. It has no future, and the mind pitches back to the past. What's behind you seems crowded, and what's in front is empty. You never heard a skipper talk about what he's going to do—because he don't know. That's how it was with me, and, I guess, with Jeff too.'

'I hoped you were coming to that,' I said, smiling.

'You haven't got it all yet, but I reckon it's clear now why I built this model of *Alcestis*. When it was done I brought her up here. It took me a good month to put her in sailing trim, just as any new vessel had to find herself, and get the set of her canvas right, and learn the feel of wind and water. I was busy at this one day, not noticing anything or any one else, when there came the model of a barque, beating across from the other side of the pond. I knew in a second it was *Ariadne*. There was a rake to her masts you couldn't mistake. Opposite me was Jeff. No mistaking the cut of his jib, either.'

'That was odd.'

'No, it was the most natural thing in the world. I pushed off *Alcestis*, and walked round the west side, and he launched *Ariadne*, and came round the east. Each of us made a semi-circle of the pond, finishing where the other started. Same with the ships. They passed each other in mid-pond, making the same weather of it, though *Alcestis* points a little closer. She always did.' He paused, laughed contentedly, and re-lit his pipe. 'We quit that evening by mutual consent, and never a word between us.'

'Who spoke first after that; for, I assume, you did speak?'

'Well, that's the queer part of it. After a while I seemed to see Mercy on *Ariadne*, and the thing got almost too real. But I couldn't stay away. When Jeff was late I felt vexed, and I reckon it was the same with him. One time he didn't come for a week. I got his address from the company, sneaked round to his place in Putney, and found there was nothing much wrong. We were both too proud to speak, though we were both aching to. Hate was dead. I began to feel that any man Mercy had loved must have been all right. I don't

know what he felt, for he never told me, but it had the same effect. I suppose it sounds as though we acted like children, and perhaps we did, but it isn't easy for a man to climb down when he's been in command of ships and men for most of his life. There's nothing quite like having a ship and her company in the hollow of your hand, and the high seas in front of you. We were both straining at a leash, and afraid the leash would break. I don't know if it ever would have happened if it hadn't been for *Alcestis* and *Ariadne*.'

'How was that?'

'They were becalmed in the middle of the pond one evening, and lay a fathom apart. Put that into miles, and the ships into their full size, and you get what happened that night in the Indian Ocean. Jeff knew it, too. The sun went down. Jeff's figure was indistinct when the park guard told us it was time to quit, and he would be responsible for the ships. But we wouldn't budge. He gave it up, and went home. Been at sea himself, he had. So I stuck, and Jeff stuck, with the same thing in both our heads, and living it all over again. I could imagine the binnacle-lamps on those ships, and hear the talk drifting up from the fo'c'sle, and a yard or a boom would swing over just as it used to. But, instead of the silence, I got the noise of London and the traffic-lights along Bayswater Road.'

VI.

He stopped again, and I began to see how it is that the spirit of man infused itself into the things of wood and canvas in which he used to brave the unknown, and how those things must have thrilled with the same high tension of endeavour as did their masters and creators. The same fibre was in them both.

'After a while there was a breath of wind,' continued my friend slowly, 'and *Alcestis* put her nose into it, came about, and headed south beside *Ariadne*. I stood still as they came along, hulls almost touching. Jeff came, too, down his side of the pond. I felt a bit queer, and I suppose he did. *Alcestis* and *Ariadne* reached the bank dead-level, and two feet apart. Jeff was there by that time. He stooped to pick up his boat, and his elbow bumped mine. I sort of figured it would. "Sorry," he said. "That's all right," I said; "and you've got a shade too much slack in your main sheet." "Maybe," he says. "And I think your mizzen-mast is stepped a mite too far forward. Good-night." "Good-night," I says. "See you to-morrow." And that's how we began again.'

He chuckled, and sent me a communicable grin. 'I told you that ships had souls. Don't that prove it?'

I nodded. 'It's enough for me. Is Jeff here to-day?'

He pointed toward the Broad Walk. A man

was coming across, pushing an ancient perambulator, on which was balanced a model ship about the size of the *Alcestis*, but differently rigged. He had a short, snow-white beard, a round jovial face, and rolled a little as he walked. He waved a hand, marched to the other side, and made preparations. My friend slid the *Alcestis* gently into the water, and waited. At a signal the two tiny vessels commenced their pigmy voyage, while their masters began a watchful patrol, but on the same side of the pond. I reckoned that ships and masters would meet half-way.

GEORGE.

THE sun was setting scarlet as the barges drifted by,

And tap'ring masts of foreign ships stood dark against the sky;

He thought of going homewards, then his mind went far away

To watch the San Diego lights shine out across the bay.

He'd saved a bit of money, and the shop in Camden Town

Was paying, and his wife had said, 'You ought to settle down.

You're forty-one to-morrow, George, and are no more a youth

To muck around in foreign parts.' She merely spoke the truth.

Not only San Diego; as he pondered, other bays Appeared as he had seen them—all came back in different ways.

'Bad towns you're longing after,' she had said to him last night.

'Those towns and other women!' But she had not been quite right.

It never was the women, though he liked to hear them sing

Behind their latticed windows, like the birds that call in spring;

He'd sit and watch them dance and move across the saw-dust floor,

And knew them all by name at every port he went ashore.

It was not other women: love and comfort, all the best,

Were here at home awaiting him. . . . What would not let him rest?

That something that had called men out across the world so oft,

That lonely calling voice that's e'er beyond horizons soft.

'Twas there by night in London docks, was whispering in the tide,

And seeking 'mong the wharves and creeks along the river side.

A trip to 'Frisco only! Just the last of all those trips,

And he'd come back to Camden Town, and sell his fish and chips.

P. G. N. CHAMBERS.

THE MONTH: SCIENCE AND ARTS.

A HUGE PAPER-MAKING SCHEME.

IT is common knowledge that the paper on which most newspapers are printed is made from wood, and that large areas of forest abroad, more especially in Newfoundland, are being devastated to maintain the supply. The wood is literally ground up into pulp before it is fit for manufacture into paper, and this process requires a large amount of power. A huge scheme for producing the necessary power from water and for laying down a factory to produce 120,000 tons of paper a year is now being carried out for the Newfoundland Power and Paper Co., Ltd., by Sir W. G. Armstrong, Whitworth, & Co., Ltd., Newcastle-upon-Tyne. It is impossible within the space of a paragraph to do more than touch on the outstanding features. Full details will be found in our esteemed contemporary, *The Engineer*. The water-power is derived from a lake with an area of 150 square miles, which drains a large surface and is capable of being made to maintain at all seasons a flow of 4000 cubic feet per second. From this lake the water is conveyed through canals and natural channels to the head of the pipe line leading to the power-house, 250 feet below. There are seven pipes, which convey the water to a like number of turbines in the power-house. Each pipe is $9\frac{1}{2}$ feet in diameter inside, and 4000 feet in length. For the first 2500 feet the pipes are built up from wood staves and steel hoops, like barrels. Steel plates riveted together are used for constructing the lower ends, which are subject to high pressures. At the turbines the pressure is 108 lb. per square inch. Water is admitted to the pipes through sluices 12 feet square. These are closed automatically by a trip gear if the speed of the water in the pipe exceeds a pre-determined limit, as would be the case should a pipe burst. Each turbine is capable of giving 14,000 horse-power when running at 375 revolutions per minute. It is astonishing how efficient a big water turbine can be made. The loss of power in this case is only 9 per cent. In the best of the old-fashioned water-wheels only 75 per cent. of the power in the water was utilised. A huge butterfly valve made of cast steel is fixed in each turbine to shut off the water. This is closed by hydraulic pressure from the supply pipe, which acts on a piston. Governing is effected by adjusting the ring of gates which admit water to the runner. But all the oil-operated governor does is to control the flow of oil under a high pressure to either side of a piston, the latter opening or closing the gates as required to maintain a uniform speed. Each turbine is coupled to an electric generator which gives

current at 6000 volts. For transmission to the paper-mill, 32 miles away, the pressure is transformed to 66,000 volts, so that only one eleventh of the quantity has to be carried by the line conductors. These are of aluminium with a steel core, aluminium being a good conductor, while the steel gives the necessary strength. These conductors are carried on latticed steel towers about 400 feet apart. At the mill the pressure is transformed down to 2200 volts for the bigger motors, and to lower pressures for small motors and for lighting. A considerable quantity of steam is required for paper-making, and this is supplied by boilers which are heated by electricity at a pressure of 4400 volts. No less than 200,000 lb. weight of steam is required per hour, or as much as would drive engines of 20,000 horse-power. The paper-making machines, which have been supplied by a Lancashire firm, are said to be the largest in the world. They turn the paper out in a width of 219 inches. To supply the paper-mill, 200,000 cords of wood per annum will be needed, and this huge quantity will be taken from forests estimated to yield 10,500,000 cords. [A cord = 128 cu. ft.]

AN ARM-CHAIR ASH-TRAY.

For the smoker seated in an arm-chair the most convenient position for his ash-tray is frequently the arm of the chair; here it is very liable to be knocked off. The latest novelty in ash-trays is one attached to a leather band which is weighted at each end and hung over the arm of the chair. On an upholstered arm this device takes a good deal of force to move it. The trays are made in silver, gilt metal, or oxidised metal, and the leather bands are of various colours, the complete device presenting a handsome appearance.

A NOTABLE DEEP-WELL PUMP.

In our issue for January 1922 there was described, under the heading, 'Simple Deep-Well Pumps,' an entirely new form of apparatus for raising water to the surface of a well. Owing to the depth of the well (400 feet), and the high efficiency obtained, a pump of this description which has been installed in the Dover Forts is of especial interest. In their main characteristics pumps of this kind resemble the well-known elevator by which grain is raised. This contrivance has a pulley at the top and another at the bottom, with an endless belt between them on which are mounted steel scoops. When the top pulley is driven the belt comes up one side and goes down the other, the scoops, or 'buckets,' as they are called, scooping up the grain at the bottom and coming up with it to the top, where, in going round the top

pulley, they shoot out their contents. The pump now being described has a corresponding pulley at each end, and a Balata belt, which is not affected by water. Instead of buckets, however, the belt is fitted with three rows of horizontal cells. According to *The Engineer*, each row 'consists of a strip of steel about $1\frac{1}{2}$ inches wide, which is folded so as to form a continuous series of triangular-shaped cells having a depth to the face of the belt of about one inch.' The remarkable feature of these cells is that after being filled with water at the bottom of the well, where the belt is immersed to a depth of about 10 feet, they hold the water without much spilling during the long journey upwards of 400 feet. When the belt passes over the top pulley, centrifugal force causes the water to fly out from the cells into a collecting spout. The bottom pulley frame is mounted in vertical guides, and is weighted to keep the belt tight. Except for a pulley immediately above the bottom one, the belt is not guided. It travels upwards at a speed of about 500 feet a minute. The top pulley is driven through reduction gear by an electric motor. This pump was designed to lift 3350 gallons an hour from a depth of close on 400 feet. According to tests the wastage of power due to spilling and friction amounts to only 30 per cent. of the power applied to the top pulley. This is a good result for any type of pump; while the simplicity of the installation and its low cost compare favourably with alternative devices. It may be remarked that for comparatively shallow wells no guides are required at the bottom; hence the work of installing such pumps can be carried out entirely from the top.

FINDING THE ELECTRIC-LIGHT SWITCH IN THE DARK.

Ignorance as to the whereabouts of the electric-light switch is a common worry when one is entering a strange room in the dark. A device is now obtainable which indicates the position of the switch by a luminous knob. Measuring a quarter of an inch across, this knob is coated with luminous paint and mounted on a strip of brass. This strip corresponds in curvature with that of the switch cover, and has turned-up points at the ends. To fix the device in position, the cover is unscrewed until the points at the ends of the strip will pass under the edge. It is then screwed up again and grips the strip, leaving the knob exposed. In a dark room this luminous knob is seen at once, while it saves finger-marks on the wall-paper round the switch caused by those groping to find it.

A REMEDY FOR SAGGING MATTRESSES.

Most of us have spent uncomfortable nights on old spring mattresses which sag in the middle. A contrivance has been brought

out recently which corrects this fault at a very moderate cost. It consists of a frame, fitted with a number of spiral springs, which is hung to the frame of the mattress by steel straps. This frame does not extend the full length of the mattress, but supports the middle part, where the sagging takes place. It has six cross rows of spiral springs, and is adjusted for height so that these just touch the under side of the mattress when it is level. The springs are strung together at the top to keep them in position, and are then covered with a piece of carpet, felt, or hessian, which prevents grating (with accompanying noises) between them and the mattress. By these means not only is the sagging of the mattress prevented, but the result in comfort is equal to that obtained from box spring mattresses; in fact, the contrivance described is almost identical with the modern spring mattress except that it is shorter. The frame is varnished and the springs are rust-proofed. It is very easily fixed to any spring mattress if the complete instructions packed with each frame are followed out. So confident are the makers that this appliance will give satisfaction that they send it on approval without any payment, the customer returning it if he or she is not satisfied with the results.

CLEANING OF BOILER-FLUES BY STEAM.

In spite of the many gas and oil engines to be found up and down the country, our main source of power is still steam. The use of boilers to provide the necessary steam involves one of the dirtiest jobs that men are called upon to carry out. This is the cleaning of the flues from the flue-dust which accumulates in large quantities. Until a few years ago this operation entailed shutting down the boiler and waiting until the metal and brickwork had become cool enough for men to enter, when the dust was removed by sweeping and shovelling. Where there are a number of boilers, the shutting down of one periodically is perhaps not of very great consequence, but in the smaller mills and factories, which have only one or perhaps two boilers, flue-cleaning means the loss of a day's work. In these circumstances the delay is minimised as much as possible by tackling the job long before the flues are cool, when, as may be imagined, the work is exceedingly unpleasant, if not positively dangerous. These difficulties have been successfully met by a patent mechanical flue-cleaner. In this device special groups of nozzles (connected by pipes to the boiler), through which steam is blown once a day, are placed in the flues. These nozzles, which are arranged at intervals throughout the flues, project the dust towards the chimney, that is, in the direction of the draught. In some cases, such as collieries, brickfields, and steelworks, the flue-dust is discharged from the chimney-top; but where

it would cause annoyance, the dust is collected in a special chamber, built to one side of the main flue, through which the gases are directed during the time the nozzles are in operation. This chamber is provided with water sprays to assist in trapping the flue-dust. It can be emptied by hand at any time without disturbing the cleaning of the boilers. In some cases the chamber is raised to a sufficient height above ground to allow of the flue-dust being dropped into a cart. Apart from the saving in labour effected by this method of cleaning flues, the heating surfaces of the boilers are kept free from soot, resulting in a considerable saving of fuel.

A REVOLUTIONARY DEVELOPMENT OF THE MAGIC LANTERN.

A development of the optical lantern which has been made in the United States bids fair to revolutionise the ordinary method of working this instrument. One of the principal features of the new development is that the rays of light from the lantern do not reach the screen from the front, but from the back. Striking a specially prepared screen at the proper focus, they form an image which is clear and distinct either in broad daylight or in artificial light. Another feature is the successful employment of what is called an opaque projector. A page of manuscript or of printed matter, a cutting from a newspaper, a picture post-card, or any other kind of illustration, is placed in the lantern and is immediately thrown on to the screen. It is evident that such an invention is a powerful auxiliary in visual education, and we are informed that it is already in use in over 2000 schools, as well as in the principal colleges, universities, and medical schools of the United States. Many churches, too, we are told, are adopting it for purposes of instruction and entertainment. An interesting development is its use in connection with the Stock Exchange tape or 'ticker.' The long, thin tape recording business transactions on the market is automatically fed into a lantern, which throws the picture of the quotations on to the screen placed on the 'floor' of the New York Stock Exchange, and also in some stockbrokers' offices. Hundreds of onlookers can thus see the progress of the market at one and the same time.

ENGLISH RAPID-HARDENING CEMENT.

As a response to the quick-hardening cement of French origin which formed the subject of a paragraph in this Journal for October 1923, an English cement with similar characteristics has been lately placed on the market. It is essentially a Portland cement, made of the usual constituents but in modified proportions; and improved methods of manufacture have produced quicker hardening and increased strength. According to the results of tests made by the selling agents, which are given in

The Engineer, the new cement has a tensile strength after one day of 450 lb. per square inch, this figure being increased to 900 lb. after seven days. Ordinary Portland cement has no useful strength after one day; after seven days the strength of an average sample is 750 lb. Tests on beams of reinforced concrete made from the new rapid-hardening cement and on similar beams made from the ordinary variety, carried out by Professor S. M. Dixon at the City and Guilds Engineering College, South Kensington, showed the new cement to have practically treble the strength of the ordinary kind after four days, and double after fourteen days. Compression tests showed four times the strength in some cases. Naturally, the short time in which this cement becomes strong as compared with ordinary Portland cement allows of carrying out construction work much more quickly.

PETROL TRACTORS FOR YARD HAULAGE.

In many industrial establishments heavy goods have to be moved from one part to another of extensive yards. Such establishments include collieries, timber merchants' and ship-builders' yards, brickfields, and railway goods stations—to name only a few of them. At one time horses were used exclusively for haulage of this nature. Then followed the steam locomotive for use on rails, and the steam tractor for yard pavements. Of late years the electric truck, as seen in big railway stations, has achieved some measure of popularity; but the petrol tractor, which has recently made its advent, seems likely to become the prime favourite in the future. It is much lighter and less costly to run than tractors propelled by either steam or electricity, while it will handle heavy loads more quickly than the steam tractor. With its rubber-tired wheels, the petrol tractor can haul either road or rail trucks. The motor, rated at 22½ horse-power, is fixed with the radiator under the usual car bonnet in the front of the tractor. It drives the back wheels through a differential and a chain or a worm gear, according to the model chosen. Of these models there are several. A seat for the driver is provided at the back of the chassis, where he has the steering-wheel and the controls conveniently placed before him. A push plate is arranged in front of the radiator, and a similar plate at the back of the chassis. Chains on rollers with crank-handles and ratchets are provided for towing at a distance behind; also chains with spring shock-absorbers for towing close up. Alternatively, automatic hitches controlled by the driver are fitted. Some models have only two speeds and a reverse; others have four speeds. The tractors measure 8 feet in length, with widths of about 4 feet, while the weights range from 21 to 31 cwt. Two special models are made; one with flanged steel wheels to suit standard-gauge railway lines; the other with a platform at the rear to take loads up to 2 tons. A number

of these petrol tractors are now in service, and are working to the satisfaction of the purchasers.

FREE BATTERY CHARGING AT HOME.

The widespread adoption of 'listening-in' sets has led to an enormous increase in the demand for low-voltage batteries. These are mostly of the accumulator type, which has to be charged at intervals. Small batteries are also largely used in cars for ignition, lighting, and starting. Charging from lighting circuits at 220 volts is very wasteful, because between 95 and 98 per cent. of the pressure is converted into heat (and is therefore wasted) in the resistance necessarily involved. Electric supply undertakings and some garages have special appliances for charging such batteries without incurring this loss, but accumulators are heavy articles to take to and from the nearest charging station, which may be a long distance away. A device for charging low-voltage accumulators from house-lighting circuits has been invented recently by Mr F. A. Wilkinson, M.I.E.E. This consists of a change-over switch, placed in the negative main circuit next to the consumer's fuse. By means of this switch the current can be passed through the battery to be charged instead of direct to the out-going terminal. When lamps are lit and current is flowing, the battery is automatically charged; and the process costs nothing, since the lamps would be required in any case. It is true that the resistance of the battery reduces the pressure at the lamps, but the slight dimming of the light is barely perceptible. If electric kettles, irons, or motors for driving domestic machines are used in the house, charging will also go on while these are in operation, at the cost of a very slightly increased consumption of current.

A BANDIT ALARM.

A development arising out of the war or post-war conditions is the daytime 'hold-up' in a bank, a post-office, or a shop. The difficulty of giving the alarm in such cases is that the victim can make no perceptible movement of the hands when threatened with a revolver or an automatic pistol. But the feet, being screened by a counter, may be used for making electric contacts whereby alarm bells are rung. Based on this fact, a simple electric alarm-bell system has been devised recently which is put into action by pressing down a contact button with the foot. The apparatus consists of a powerful electric bell, a dry battery to work it, and a push-contact which may be fixed in any convenient position for the operator's foot. In a large establishment a number of push-contacts can be connected to one bell and battery circuit. As might be expected, and as has been proved by experience, 'hold-up' bandits are very nervous of alarms, and a powerful bell which rings continuously causes most of them to decamp

hurriedly. These alarms are very easily installed. That something of the sort was wanted is demonstrated by the fact that an order for a large number has been placed by a well-known bank.

A NOVEL BATTERY-IGNITION DEVICE.

During the last few years there has been a distinct revival in battery ignition for the motors of cars and lorries. The system entails the provision of a coil, a condenser, and a battery, which are stationary and fixed in any convenient position, and a contact-breaker, with a distributor, which has to be driven at half-engine speed. If it be desired to change over a motor from magneto to battery ignition special arrangements have to be made on the engine to drive the rotating parts at the correct speed, while two wires are required between these parts and the coil, which may be some distance away. In a recent battery-ignition device the coil and the rotating contact-breaker and distributor are combined in a form having the same dimensions and driving spindle as a standard magneto. All that is necessary to change over the ignition system from magneto to battery is to put the new device in place of the magneto. Other advantages include the absence of wires between the coil and the engine, and the practicability of using the terminals of the device for a portable lamp, which is more often wanted on the engine than elsewhere. This appliance has been especially devised for ignition from the lighting system with which most modern cars are fitted. The chief advantage of battery ignition is that any motor can be started with certainty at the first pull-over on the coldest morning, provided, of course, that the carburetter is functioning correctly. In the demonstration car, a 25-horse-power Vauxhall, the motor is started by giving the starting-handle a quarter turn with the foot. A fact that inspires confidence is a free 14-days' trial offered by the makers, after which, if the device does not do all that is claimed for it, they will take it back and refund the money paid.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, Chambers's Journal, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

. TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, Chambers's Journal, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

C R A S K I E.

By HILTON BROWN.

PART I.

I.

THE weekly market-day at Brig o' Muir was wearing to a close. It had been a day of warm autumn drizzle, but now the clouds broke in the west and the late afternoon sun sent shafts of level light athwart the thinning concourse in the streets, the herds of sheep and bullocks surging out of the mart. In hotel yards the clatter of hoofs and the creak and rattle of harness told of preparations for departure. Hotel bars, enjoying their great hour of the week, roared merrily with loud rough voices.

In the 'coffee-room'—where no one ever thought of drinking coffee—of the Gilzean Arms big John Bonnar of Craskie finished his tea, counted over rapidly a thick bundle of notes, and slapped them into a wallet. His round rosy face under the fair hair assumed a momentary air of abstraction while he made the count, and then relapsed into vacancy as he looked up at Mrs Lockie, the landlady, who stood waiting to clear away the dishes. Once again that observant lady was reminded of a large, well-fed, well-beloved cat; the smooth cheeks, the big golden moustache, the luminous greenish eyes that looked up at her were all reminiscent of some kindly, affectionate, and wholly domestic beast.

'Was the eggs to your taste, Craskie?'

'Fine!' Craskie's sudden blaze of a smile sprang into his face and gave it astonishing life—much as the late sun outside, bursting through the clouds, gilded and lit the countryside.

'The ham wud please ye? I telt M'Gowan the last was ower saut. If I don't know yer tastes now it's no' for want o' experience.'

Craskie smiled absently again. He hated and detested ham and eggs for tea; left to himself, it was a thing he would never have had. But it was the Gilzean Arms's idea of a suitable dish for a farmer about to set forth on a six-mile drive at the close of his day's business. For twelve years—Craskie reflected a moment as he worked out dates in his head—ay, for twelve years Mrs Lockie had set in front of him every Tuesday at five o'clock an enormous dish

of this abhorred delicacy; and every Tuesday—except, of course, when he was 'away at the war'—Craskie had methodically eaten it. It was just twelve years since for the first—and only—time he had tried to suggest something else.

'Ay!' he said solemnly. Craskie's 'Ay' was a wonderful word; it appeared to mean—and did mean—nothing; yet somehow it produced the effect of a judicious summing-up of any existing situation on which it happened to comment. In the hill-farms round about Brig o' Muir you do not speak for the mere sake of speaking; if there is anything to be said, you say it; if not, you say 'Ay,' or 'M'phm,' or 'Jist that.' And if you can get into any of these as much as Craskie could get into his least conscious 'Ay' you are something of a conversationalist.

'Ay!' said Craskie again; and Mrs Lockie, entering into the spirit of the talk, screwed her mouth to one side, fixed her gaze on the street outside, and said 'M'm.'

Craskie scraped back his chair and stretched out his huge arms till the great muscles in them cracked. He brought them down on the table with a crash that made the dishes jump.

'Ah well, I'll just step into the bar for my usual,' he said. 'Ye might tell them I'll be out to the trap inside a quarter of an hour.'

Mrs Lockie, who admired him secretly, but none the less whole-heartedly, gave him an arch look.

'You an' yer usuals!' she remarked pleasantly. 'When ye've got a wife to harry ye hame there'll be nae mair o' *that*.'

To badinage of this type Craskie was normally a willing respondent; the applause of his great roar of a laugh rarely failed to crash out with the last word of the jest. But to-day he only looked sheepish and put out. He contrived a painful simper that to Mrs Lockie was worse than an oath. For Mrs Lockie had suddenly remembered—and realised with the remembrance—that she had been guilty of a most appalling *bêtise*. She coloured violently, made a great clatter with the dishes, and fled to the kitchen.

There she met her husband, a genial incom-

petent who regarded himself as a profound philosopher—and who could not have run the hotel without her for a week.

'Oh, man Davie,' she burst out, 'what think ye I've just gone and said to Craskie?' And she retailed the scene with gusto. "'When ye've got a wife to harry ye hame,'" says I, "there'll be nae mair o' that." Whatever possessed me to say sic a thing, an' at this time, of all times!

Lockie took his pipe from his mouth and looked at his excited wife with the cold contempt of an Academician.

'What for no'?' said he.

'What for no'? Ye ask me that! An' me maybe ruined the lassie's chances a'thegither.'

'Havers!' said Lockie. 'Folks doesna pay s' muckle heed to you an' yer sayin's as ye think. Like all auld wives, ye've naething in yer heid but marryin'. Hoo much o' this clash about Craskie and the lassie Maitland is due to yer ain spreadin' an' yer ain make-up?'

'I thought folk paid nae heed to me,' said his wife, scoring her point promptly.

'Folks'll aye listen t' auld wives' havers.' Lockie realised that his retort was rather lame, and took up a firmer tone. 'I say what I've said all along. I've asked ye a hunnert times—what need has Craskie to be marryin' any one at all? Has he no' a fine downsittin' where he is? Doesna Sarah Begg look after him jist as weel an' better'n any man could want?'

'David Lockie!' said his wife. 'Fifteen years syne, when ye were comin' round my father's house an' a'boddy kenned fine what ye were after—if some one had come an' said t' ye that ye were well off wi' Sarah Begg to look after ye, an' no' to be thinkin' o' marryin'—what wud ye ha' said?'

The outburst of an electric-bell deprived her of Lockie's answer to this involved question. She hurried away upstairs, throwing over her shoulder a Parthian shot of 'Sarah Begg!'

Up in the coffee-room Craskie finished his Gargantuan stretchings, felt his pockets carefully for pipes, pocket-book, watch, and tobacco-pouch, and stepped across to the dingy mirror above the mantel for a moment's attention to his tie and hair. He had been feeling in a ferment all day, and it was with something akin to relief that he beheld in the mirror only the old familiar face, rosy and good-natured, lit by a faintly humorous surprise. Straightening his tie, he beheld with more than usual satisfaction the great shoulders and upper arms that seemed to burst from his rough tweed coat. In the neighbourhood of Brig o' Muir a degenerate civilisation has not yet substituted professional football for Highland games; it was not so long since this same John Bonnar had putted weights and tossed cabers to distances which none of his contemporaries could approach. Before the war he had won prizes as far away

as Braemar in one direction and Strathpeffer in another. The name of John Bonnar was known from Dee to Ness.

Standing before the mirror, he doubled his arm and felt the muscle. He could do it again. Ay! He felt fine and well. Then the torments of the day came suddenly back to him; his honest face clouded over and he turned away like a wearied man.

He boldly entered the bar, however, called for his 'usual,' and fell into a dull talk about sheep with his neighbours. From the corner two old men with mean, scrubbily-bearded faces watched him drink. One was Sandy Skinner of Louby and the other was Jimmie Toddock of Shores.

Presently Skinner spoke. So far as a cleft palate would allow, he was understood to say that Craskie was playing fast and loose with the lassie Maitland. 'A dichty game!' he spluttered virtuously. 'A dichty game.'

Toddock shook his head. 'Na, na, man, it's nae that ava'. Yon mannike cudna play fast an' loose wi' a nowt. He jist canna mak' up's ain mind. He will, an' he winnae. He's aye been the same. Left a young laddie wi' s mither tae guide him—an' she was the managin' sort, yon. She was that. She made up's mind for him for twenty year, an' noo she's gane he canna dae't for himsel'.'

Mr Skinner keekled loudly, wiping the water from his bleary eyes. 'An' she wad yet,' said he, 'she wad yet. Heh, heh! she wad that. Gin Nelly Bonnar was still aman's there'd be nae Peggy Maitland for ony laddie o' hers. Na-na!'

Toddock echoed his unpleasant laughter. 'Ye dinna ken, man,' said he, 'that the ghaist o' her's no' guidin' him yet. He's in a wandered-like state at the best o't ony way. . . . Anither wee yin, Sandy, afore we go—hoot ay, man, jist wi' me.'

II.

The rich red-gold of the sunset died suddenly behind Craskie as his horse dropped into a walk on the long hill below Tomnahoy. Something of the sombreness of the country-side from which the light had been struck fell upon Craskie's mind. The horse pulled strongly at the hill—a sturdy, useful beast, but better bred and better made than was common thereabouts. The trap bespoke a careful owner comfortably off; its paint was new, and it answered the two tests of the Brig o' Muir ostlers—rubber tires and rubber foot-mats front and back. Its smartness was of a piece with the good Harris tweed of Craskie's suit, the decent briar pipe he smoked, the refined mixture that shed an aroma round him. It never occurred to Craskie to style himself a gentleman-farmer, but he might have done so without violence to either component of the term.

Yes, Craskie was a good farm, a very good farm; and it was going to be better. The garden was beautiful, the old-fashioned house was developing in his careful hands into the sort of place of which tenants rarely permit themselves to dream. Only last year he had put in a bath with hot-water circulation—a hundred pounds that had cost him, what with the new range it had meant, and all. It was a magnificent bath; you could almost swim in it. This year, far in advance of all his neighbours, he was toying with the idea of a small electric plant. . . . Yes, Craskie was a house you could ask any one to share without embarrassment.

Then why didn't he ask Peggy Maitland?

Craskie knocked out his pipe on the step iron, leaning carefully down to see that the hot ash fell clear onto the road. Yes, why didn't he? Was it because he knew she would decline? No, it wasn't that. On the contrary, he was almost sure she would accept. It wasn't that.

As the horse, blowing a little, toiled up the interminable ascent, Craskie ran over in his mind the brief conversation he had had with Peggy in the streets of Brig o' Muir that day. How precious every moment of that conversation had been! Why, the Lord only knew; now that he came to try, he could hardly recall a word of it. He had talked about his plums, and she had been eager and interested. He had told her a story about his first horseman—an excellent servant with a termagant of a wife—and she had laughed generously. He had told her of his difficulties over the electric-light project, and she had been intelligently sympathetic. But all the time she had given a sort of impression that though these things were deeply interesting to her, there was something he might say any time that would be even better. Did he know what it was? Fine! Ay, fine. Then why didn't he say it?

Sarah Begg!

As her name came into his mind her figure rose before him like a photograph. There she was—pale, big-boned, rectilinear. She was not ugly—yet certainly she was not bonnie; no, no, never that—she was not handsome altogether, she was not exactly grim, she was not at all masculine, neither hard nor solid nor mirthless nor Puritanical. No one of these words would do; but had Craskie possessed sufficient subtlety of mind, he might have told himself that she was all these things at once, and also in some incredible way all their direct opposites. He saw her black dress, her square, broad shoulders; her finely-waved black hair, her oddly white hands, her great right-angled chin. He heard her level, toneless voice—making statements one did not somehow dream of contradicting, offering suggestions one would never dare to refuse. That was Sarah Begg, Craskie's housekeeper.

Craskie's master? 'Tah!' he said in disgust at the idea; and then submissively, 'Ay!' Not his master—no, no; but it came to this, that before he, Craskie, could ask any girl to marry him he would have to tell Sarah Begg that he would no longer require her services as housekeeper. And how in the name of all desperate enterprise was he to accomplish *that*?

He couldn't, he simply couldn't; and that was just why he couldn't say to Peggy Maitland the thing she was quite clearly waiting to hear.

The horse crested the hill, threw up its head, and started to trot. Craskie pulled it back again into a walk. He wanted to think, to let his mind blend with the gentle melancholy of the evening along the pleasantly sad avenues of self-pity. Always, it seemed to him, he had been dominated by women. There had been his mother; his father had died when he was six, and from then onwards till the day of her own demise he had done what his mother told him. It was part of Craskie's simple creed that decent men were fond of their mothers; he could bear instant tribute to his. Much of the prosperity of the farm of Craskie was due to her magnificently capable direction—the sharpest buyer in the county, the most judicious seller, and when it came to a knowledge of sheep . . .! And he could remember many kindnesses, great and little—so long as he had done exactly what she wanted. But when or if he had tried to strike out a line for himself—ah, then it was a different story! What a woman she had been; she could put any man in his place with half-a-dozen words. 'I sorted *him*,' she would say. Ay, she had 'sorted' her son anyway.

He could remember her attitude to girls—and, indeed, to all women younger than herself. Merciless! There was Bessie Hope, who had gone off and got secretly married to young Wishart because her parents would not let him have her openly; there had been Mrs Abbot at Balforra, who had turned from her drunken boor of a husband and 'carried on' with another married man. Craskie had had a sneaking idea that both of these culprits were perfectly within their rights; but he would not have dared to hint at such a thing to his mother. He shuddered yet as he remembered her voice when she spoke of these delinquents; it would have cut a hole in a stone dyke! And of the two it was Bessie Hope who had caught it the worse. To run away from your husband was eternal damnation and hell; but to go against your parents—oh, unspeakable!

Craskie strove honestly to keep the hardness out of his thoughts; his mother was dead these four years, and it was to her almost entirely that he owed his present comfortable state. But suppose he had been going home to *her* to-night to tell her that he wanted to bring Peggy Maitland home as mistress of Craskie? The cold sweat almost stood on his brow at the mere

thought. That could never have been done—never, never, never.

It was his mother who had installed Sarah Begg; and as well as if he had seen into her mind, Craskie knew that she had designed Sarah to be a perpetuation of herself when she should no longer be there—to guide John in the way he should go, and to keep all 'impudent, forcing creatures' the length of the Brig o' Muir road away from Craskie. The war—accursed disaster!—had given her funds to indulge in Sarah; almost in the first days of the struggle she had grasped the fact that sheep were going to pay as never before—and everything on the place had gone into sheep. She had grabbed the market a good year ahead of her neighbours, and she had never let it go. They had made—well, not a fortune, but something more than a very decent turnover. And in 1916 Mrs Bonnar, failing the least thing herself, had commanded a housekeeper. Whatever Mrs Bonnar desired appeared instantly, as though supplied by a subservient Providence, though for much simpler needs others might search the length and breadth of the country in vain. Sarah Begg had materialised; she had settled in; she had persisted. And how on earth was she to be got out? She was a vitally strong woman—'Never a day in my bed, Mr John'—she had thirty years of vigorous life before her. She was perfectly contented at Craskie, as she well might be, and had taken root there for good. She remained a virgin, and the idea of anything else was unthinkable. No, there was no outlet; only by his own effort could Sarah Begg be dislodged. Could he make it?

Craskie had been glad to turn to the recollection of his mother's commercial aptitude; that, at any rate, he could sincerely venerate. Yet the thought of the war had brought a very bitter memory of her, too. She had decided ('I have decided, John'—he could hear her formula yet) that he was not to go to the front; and she had kept him back till the last possible moment, when he was taken from her. John Bonnar of Craskie—Private Bonnar, Corporal Bonnar, Sergeant Bonnar, X/Yth Seafields—had been a conscript. He had got the Military Medal, but—he had to be fetched. Not soon would Craskie forget those first years of the war—the looks the women gave him sometimes, the coldness of the older men at the market, the hell of that Tuesday when the Seafields, with their pipes playing, marched through the long street of Brig o' Muir, and John Bonnar of Craskie stood cheering—among the spectators. Among old men and wastrel youths and the village idiots; among the lame and the halt and the blind. And he the strong man of the county, as every one knew—a champion at the Highland games!

Not soon would he forgive his mother that; or himself either, for giving in to her.

Well, well, his mother was dead, and Sarah Begg was her reincarnation only in the morbid moments of his own imagination. His mother would have been immovable, fatal; Sarah Begg could be told to go. And she *would* be told—that night, maybe; the memory of those bitter days of the war had strengthened him to that. His mother had been wrong about his going to the front; she had almost admitted as much herself, a length to which she had never gone on any other occasion within his memory. Maybe if she had lived she would have seen herself wrong about the 'impudent, forcing creatures' as well. Anyway, Sarah Begg was *not* his mother, as she would soon find out.

A catch newspaper phrase jingled in his head. 'Ay,' he murmured, with a glint of his famous smile, 'Sarah Begg must go!'

(Continued on page 235.)

THE GIANT PIKE.

I AM the terror of the ways,
The horror of the pool and weir.
I am the haunting dread that stays—
I am the living, awful bier.

The nightmare of the speckled trout,
A cannibal pirate to my kin,
I put all living things to rout—
I am a living sabred sin.

My blood is rich with th' innocent,
I care for nothing that is dead.
All in the pool to me pay rent—
I must be fed—I must be fed.

Silver dace, oh I watch them race
And playfully leap in the air;
I watch through the weeds that interlace,
Deep in my lair, deep in my lair.

The timid chub I love to harry;
Even the salmon, lordly and bold,
Gives a wide berth—he doesn't tarry;
Knows me of old—knows me of old.

Translucent green, like weeds I seem
Motionless in the current,
And yet I glide and glide upstream,
A living death abhorrent.

I live on life, on life I live,
My spirit's their hereafter;
Their timid blood feeds my cruel flood,
Their agony's my laughter.

I am their knell, I am their hell,
My serried teeth their death-bed;
I am their sepulchre as well—
I must be fed—I must be fed.

I am the terror of the ways,
The horror of the pool and weir.
I am the haunting dread that stays—
I am the living, awful bier.

T. E. D. GEORGE.

BESSARABIA, A NEW TRAVEL GROUND.

By E. C. DAVIES.

I.

THE jaded traveller, weary of the stereotyped joys of the routine 'beauty spot,' might do worse than make for the delta of the Danube, and pitch his tent for a season in far Bessarabia. A journey of one night and day from Bucharest will take him to its capital city, Chisinau (Kishinev), and from there his wanderings can begin.

There are charms enough in the north of Bessarabia, where glorious vineyards clothe the hills and dense woods stretch out to fertile pasture-lands. Immense primeval forests once covered these rounded hills and rich valleys, and the rich brown earth, where the trees have been burnt away, is an indication of their former extent. To-day there are dense thickets, beautiful and wild, where beech mingles with elm, and the acacia abounds; groves of wild plums and cherries, with the fragrant eglantine finding a home amid the stately oaks. The sweet grass attracts the cattle, which come to browse among the mighty roots, and close to the villages even the pigs wander into the heart of the forests, so that little by little the clearings are widened by the pasturage of the animals.

The wooded hills dominate the terraced lands where the vine flourishes, and the villages nestling on their slopes, the white houses peeping from a wealth of green, are often on a level with the trees that crown them. The peasant builds in accordance with the needs of his primitive agricultural operations: nearness to a spring of water, favourable soil for his grapes—guided here by the instinct of a descendant of generations of vine growers—a sloping hill for the young plants, and shelter from the steppe winds. On the lower levels the crops of maize or barley are divided by thorn hedges, or low walls of the limestone which abounds in northern Bessarabia. The houses, characteristically Roumanian in appearance, have the typical long gallery running along the front, the gate pillars covered with naïve carving, the wide veranda, where the family bedding airs all day long in the sunshine, the spacious stables and granary. All the villages of the centre and north of Bessarabia possess this air of settled ease and comfort, betokening long centuries of peaceful occupation, unlike the steppe villages on the Dniester farther south, always a prey for the invader from the East. And in the *Codru*, as this long strip of the province is called, where Roumanian traditions have held out for centuries against any attempt at Russification, the people wear the graceful costume of Roumania proper, with the dignity and charm of this handsome race. The

men, picturesque in spotless white linen trousers and embroidered shirt, a scarlet sash round the waist, a sheepskin jacket slung from one shoulder, their brown heads crowned by black felt hats, are frank and free of manner. The women, sweet and gracious, if shy with the stranger, adorn their white robes with the wonderful needlework so instinct with a feeling for colour and decoration that every Roumanian woman seems to possess by birthright; and men and women alike are handsome, with fine classical features and dark, expressive eyes.

One carries away a delightful mental picture of these villages of the *Codru*, perched between orchard and forest; of the wide valleys where the great rivers wind slowly along, and the sound of the shepherd's pipe is the only other note in the stillness; of old white monasteries shining out from a wealth of greenness; of the old bastioned fortress of Suba, built in the great days of Stephen as a refuge from the dreaded Turk; its round granite towers, pink in the rays of a setting sun, the gardens of the little town beneath its walls stretching down to the graceful curve of the Dniester between the gorges cut out by its tributaries.

II.

But the wise traveller will not linger even in these charming pastorals, for beyond them lie the steppe lands, and he who has once tasted their pure air, and felt the subtle charm of infinite distances, will be drawn again and again to journeyings over these limitless plains.

The steppe of Bessarabia descends gently and regularly from the great plateau of Moldavia to the level of the Black Sea, its parallel valleys following the southern watershed, the curving line sweeping away in mighty folds to the distant horizon. One thinks of the steppes as flat; but in reality they are as full of wave-curves as the sea itself, and here and there rise into rounded folds of perfect contour, like our Sussex Downs. The 'black earth' of Bessarabia is some of the most wonderful corn-growing soil in the world, but all the steppes are not corn land, and immense stretches of velvety pasture nurture great herds of cattle and buffalo. As far as the eye can see, the same undulations of the land occur—monotonous but infinitely grand. Where the road follows the hills, the impression of solitude is complete. The fields are full of exquisite flowers of every shade; the air is like champagne; the sky marvellously clear and pure, great cloud-shadows sweeping over the horizon, casting purple lights on the land.

The charm of the steppe can be felt only by those who are willing to lend themselves to its

appeal. It is a fascination which makes all other beauty seem wearisome, save only that of the sea, to which, in its spaciousness and changeless changelessness, it has a close resemblance. And in Bessarabia the two beauties, of sea and steppe, can be realised almost together, for from the tiny village of Vilcov, where the fishermen catch the mighty sturgeon of the Danube and where the finest caviare in the world is to be tasted, to the Black Sea is only a day's journey. Only a country cart can cross the sand-dunes from Vilcov to the village of Djubria, where the road that takes one to Akkerman begins, but the drive across these dunes is a never-forgotten experience. Over miles of sand, beaten into waves by the clean fresh wind that blows from the sea, one passes great stretches of reeds, man-high, where a marvellous bird-life exists in the lovely loneliness, and gorgeous butterflies flit hither and thither in the sunshine. There are fields of blue chicory, and purple daisies, and a curious, reddish grass; and the last section of the way leads actually through the sea, the heavy wheels of the cart splashing through the green, transparent water, millions of tiny fishes plainly visible as they dart away in terror from the oncoming intruders.

If I were rich I would build me a house on the shores of the Black Sea, close to that island village that is part of the mainland only at low water. There is pure joy in basking in the glorious rays of the sun on the white sand-dunes covered with tussocky grass, fragrant with thyme and peppermint; watching the dark waters of the sea change in colour with the changing hours; in wandering amid the leafy lanes that lead to Shaba, where a little colony of French descent prepares the finest wine of a province that boasts five hundred varieties of grapes; in climbing the walls of the great fortress of Akkerman, and looking over its shimmering lake to Bolshevik Russia.

III.

The history of this town, the Roumanian name of which is Cetatea Alba, dates back four centuries before Christ. Built by the Greeks at the mouth of the Danube to protect their trade-route inland, it passed from the dominion of Byzantium to that of Genoa. After them came the sovereignty of the Tatar, until in the fourteenth century the Moldavians obtained possession of it, and under two powerful princes, Alexander the Great and Stephen the Great, made of it one of the most impregnable forts in Europe. Even Mohammed II., the conqueror of Constantinople, affirmed that, 'so long as the town remains in the hand of the Moldaves, we Turks will never vanquish the Christians'; and for long years all attempts to that end were unavailing, till at length, after a mighty battle, it fell, and under Turkish rule played an important part in the wars of that state against Russia in the eighteenth century. Recent

excavations have brought to light much of the ancient city in which the triple influences—Byzantine, Genoese, and Moldavian—are plainly illustrated. The immense strength of the great towers built by the Genoese (reminding one strongly of Norman work), the curtain walls and bastions, and the remains of the outer fortifications running down to the lake give an impression of extraordinary power, and, before the days of long-range artillery, the place must have been well-nigh impregnable.

By motor-boat from Chilia, where the grain ships take up their load from the golden granaries of Bessarabia for the sea, one can reach the quaint monastery of Lipovene monks, close to Vilcov of caviare fame. The monastery stands close to the river-bank on a narrow reach of the Danube, and in its lovely garden golden quinces, like the apples of the Hesperides, glow in their season. At sunset the trees, banked high to withstand the periodic inundations of the Danube, stand out like black fans against the marvellous colour of the sky, while the Danube shines crimson and gold in that miraculous hour. In the memory of such pictures, the traveller forgets the petty discomforts of wanderings in a primitive land, and weeks of journeying in Bessarabia add innumerable joys to the mind's treasures. One breathes again the cool, salt air of the great lagoons fringed by tall reeds, the haunt of wild birds by thousands, the birthplace of strange aquatic plants, the home of lonely fisher-folk, where some tiny creek may shelter a humble house. One remembers the red sunsets over the Danube, the chanting of the bearded monks in their quiet sanctuary, the fields of golden corn in September days, and the treading of the grapes in the vineyards; the green waters of the Black Sea lapping the white sands of Budachi; the lonely, infinite horizons of the steppes; and—kindest memory of all—the warm welcome that awaits one after long days in the solitudes in the little towns, where the traditional Bessarabian hospitality, almost patriarchal in its beautiful simplicity, still has its being.

GRAY DAYS AND GOLD.

WHEN long the road and far the goal,
Heavy the burden;
When for the sad and stricken soul
Seems there no guerdon:
A faith there is to ease the load,
A hope the heart to free—
When far the goal and long the road
For you and me!

When clear the day and calm the night
In earth's fair closes;
When dressed in silkiest garments bright
Bloom radiant roses:
A love there is for hearts that pray,
A love for ever true—
When calm the night and clear the day
For me and you!

J. M. STUART-YOUNG.

THE FIRST DOG.

A TALE OF PREHISTORIC ENGLAND.

By Lieutenant-Colonel GORDON CASSELY, F.R.G.S.,
 Author of *The Elephant God*, *The Jungle Girl*, *The Red Marshal*, &c.

I.

HIGH up on the face of a rocky hill that rose above the Thames valley a strangely-clad man pulled aside the stones blocking the entrance of a small cave, and stepped out cautiously into the morning sunshine. His only garment was a deerskin jerkin, belted at the waist, although at first sight he seemed to be clothed from head to foot in some tight-fitting hairy garb. But the fur grew on his own skin, a thick brown fur, like a monkey's; and he might have been taken for one of the apes that inhabited the forests of England then, but for the long, straight hair of his head, the higher forehead, and the strongly-marked chin, that showed him to be human. For it was hundreds of thousands of years ago; and men then did not seem far removed from the apes.

In one hand he carried a long, flint-tipped spear, while the other held three short javelins; and a small stone axe hung from a bandolier of deerhide over his left shoulder. With quick, nervous glances all round he assured himself that there was no danger near, and relaxing his cautious attitude, he turned and spoke to someone in the cave behind him. From it emerged a woman carrying a baby, and two young children followed her. She was clothed like the man in one leather garment, hers being ornamented by the skins of brightly-feathered birds fastened to it by bone skewers, and around her neck was hung a string of polished shells. But she and her naked offspring were even hairier than he was; and her features, although not unpleasing, were more ape-like.

The man, her husband, had turned away again, and was looking down into the valley below, where the river, five miles wide, swept along between dense woods. From where he stood he could see a score or more of gigantic crocodiles crawling out on to a small sandy island to bask in the sun; while everywhere great black dots rose and sank in the water—hippopotamuses, he knew them to be, for in that far age the rivers of Britain swarmed with these amphibians; while elephants, rhinoceroses, cave-lions, and sabre-toothed tigers haunted its forests, where monkeys and great apes played in the tree-tops.

The tropical climate that had prevailed in the land for untold centuries was changing rapidly, for a glacial period was in store for the world, and a vast ice-sheet was spreading over Northern Europe. Its coming was heralded by the great herds of reindeer and Arctic animals that had

already appeared in Britain; while the tropical mammals were beginning to migrate across the wooded isthmus that linked England to France, a relic of the days when what are now the British Isles were but small portions of a vast country that stretched from Scandinavia to Spain and spread out west into the Atlantic far beyond the present limits of Ireland.

Of that past history this little family of the Old Stone Age knew nothing. All that the father and mother realised was that even in their life-time the climate was sadly altered, and cold such as they never knew in their young days chilled them now. The man, who was named Koto,¹ was more intelligent than his contemporaries in the scanty population of Britain. He had taken up his abode in this cave, and by so doing had set a new fashion, which the increasing rigour of the climate soon made popular among the inhabitants of Europe.

He had been the first in his own country to wear clothes, such as they were, for hitherto men's hairy skins had been sufficient protection for them against the weather. In this his example would soon be followed, for fire and the art of making it were unknown to human beings then; and the intense cold caused by the approach of the ice-sheet from the North Pole made some artificial means of obtaining warmth necessary. But, like all pioneers, he was regarded askance by his fellows, the other dwellers in the forest where he generally sought for his family's food. Like all the inhabitants of Britain then, they and he were hunters; and, armed only with hand-to-hand weapons of stone and wood, they slew harmless animals for meat, and did battle with the dangerous ones, which preyed on them in turn.

II.

Koto looked down towards the river and debated inwardly whether to descend to the forest or climb to the undulating downs on the other side of the hill and chase the deer that roamed there. He decided on the latter course; and, putting his axe away, as it would only impede him when running, he bade the woman guard the children and remain near the cave, into which she could retire for safety if any beast of prey drew near.

Then he climbed like a goat up the rocky face of the heights that, now diminished and softened, still rise above the Thames at Richmond, until he stood on the summit looking on the grassy

¹ See 'A Child of the Stone Age,' in *Chambers's Journal* for December 1924.

downs below. Dotted here and there over them, herds of reindeer were feeding; so, with hunger lending wings to his feet, he rapidly descended the steep slopes.

But before he reached the level he stopped with an exclamation of anger. Across the undulating ground swept a large pack of wild dogs, big, russet-hided animals with prick ears and bushy tails, running silently in the chase, and before them the deer fled their fastest—for of all their many foes, these were the worst. The tiger, the cave-lion, and the spotted hyena slew them by ones and twos, but the dogs by scores.

In a few minutes, therefore, there was no game to be seen; and Koto was too skilled a hunter not to know that it would be a waste of time to look for any where the wild pack had passed. He turned his attention instead to searching the scrub along the base of the hill for foxes or other small animals that might be hidden in it.

He had poor luck. At the end of two or three hours he had found only a snake, which he killed and ate on the spot. So he resolved to recross the hill and descend into the forest on the river-bank, and was turning away from the level when his eye was caught by something moving among the bushes. Crouching motionless, he saw two or three small animals playing in the scrub. They were wild-dog puppies, and, as he watched, the mother came out of cover and lay down on the grass near them. Koto waited until she was asleep before he moved. Then he stole cautiously through the bushes toward her upwind, until he was near enough to hurl a javelin at her, just as she woke up at a warning growl from one of her offspring, which had caught sight of him.

The flint-tipped weapon pierced her heart and she fell dead. Koto ran swiftly up and knocked the astonished puppies on the head, four of them, as they backed away from him, snarling. He tied the hind-legs of all his kill together, passed a strip of deerskin through them, and slung the dead animals over his shoulder.

As he turned to go a fifth puppy, which had been lying asleep under a bush and so had escaped his eye, woke up and came towards him. Unlike the others, it showed no fear of him, and walked forward, gambolling clumsily and wagging its tail. As the man stooped to pick it up and wring its neck it licked his hand.

Koto was astonished at these demonstrations of friendliness, for dogs were then regarded as the most intractable animals of the wild, fierce and dangerous as wolves, and as ready to pull down human beings when hunting in packs. At that age of the world none had ever been domesticated, and a man would as soon have thought of trying to tame a sabre-toothed tiger or a cave-lion as a dog.

The hunter could scarcely believe his eyes when this puppy showed every desire to be friendly. He picked it up carefully, but the

little animal only licked his hand again, and nestled down confidently in his arms. Koto had not the heart to kill it, and put it down on the ground again, for the other members of its family hanging on his back would provide sufficient food, and he could afford to let it go. But, to his surprise, as he moved away it followed him, wagging its tail.

He stopped and looked at it thoughtfully. If he left it, it would either starve or be killed by some beast of prey; so it would be kinder to put it out of its misery at once. He raised a javelin to slay it, but the puppy looked up at him so trustingly that he lowered the weapon again.

Suddenly he remembered the children in the cave. How they would delight in such a play-fellow! He thought of his own boyhood and how he would have loved such a companion; so he picked up the puppy again, and it promptly went to sleep in his arms.

III.

Speculating with amusement on his wife's surprise and the children's pleasure when he brought it home, Koto breasted the slopes of the hill, carrying the little dog carefully, and started to climb down the precipitous face on the river side. He dropped from rock to rock like a mountain goat until he reached a path that he had made himself, which led around a projecting corner to the entrance of his cave. He strode along it without caution, not dreaming of danger so near his home.

But just as he got to the great rock that jutted out from the face of the hill, and was about to turn it to reach the cave, the puppy, tucked under his arm, stiffened and growled faintly. Koto checked in his stride and looked at it. The dog was awake, and, lifting its little nose in the air, sniffed and growled again.

The warning was enough for the man. Quietly laying the dead animals on the ground, he placed the puppy with them, and then climbed like a cat up the steep rocks until he reached the small cliff that rose sheer above the mouth of his cavern. Lying down, he crawled to the edge and looked cautiously over.

In front of the entrance to his home a great cave-lion crouched, ears twitching and tail beating the ground impatiently. Like a cat it was watching the hole in the cliff, and as Koto looked it rose, and with its huge paws tried to dig away the rocks with which the woman inside had blocked the entrance, the boulders that were always kept there for the purpose. Failing to dislodge them, the brute snarled angrily and lay down again.

Koto, watching it, felt very grateful to the puppy, for without its warning he would have walked straight on to the lion and, taken by surprise, must inevitably have perished. But now he was safe from attack where he was, and held the enemy at his mercy.

He drew back cautiously until he was hidden from the sight of the beast below. Looking at the loose stones lying around him, he selected two heavy, flat ones; with his sharp-edged flint knife he cut a broad strip from the hem of his deerskin garment, and with this bound the stones against the shaft of the spear, two feet from the head. Then, carrying the weapon, he crawled forward again cautiously on his stomach and looked over.

The lion lay almost directly below him. Rising to his feet, Koto lifted the weighted spear and hurled it down with all his strength. It struck the great brute between the shoulders and, breaking the spine, pierced the heart. With a convulsive shudder the stricken animal died without a sound.

Koto threw stones at it to assure himself that it was really dead. Waiting for a few minutes to ascertain if its mate was near, he climbed down by the way that he had ascended. The puppy was sitting by the body of its mother; but, seeing him, it ran to meet him, wagging its little tail. He stooped down and petted it, to its evident delight, then turned the corner, and with uplifted javelin advanced cautiously towards the lion. The small dog followed him, and at the sight of the big beast growled and rushed forward with bristling hair and bared teeth. But the common enemy was dead.

Delighted with the puppy's courage, Koto stroked it again, and called loudly to his wife. She answered from within; but not until, through a spyhole, she had seen him draw the spear out of the lion's carcass would she roll away the great stones that closed the entrance to the cavern, then she cautiously emerged with a javelin in her hand.

Seeing the dog, she raised her weapon; but Koto, picking up the puppy, held it out to her. She refused to touch it, and begged him to kill it. Even when she heard how it had saved his life she persisted; and when the two older children came out and screamed with delight at the sight of the puppy in their father's arms, she angrily pulled them away from it as it licked their little hands. She bitterly opposed its being brought into the cave, and tried to drive it out; but Koto, grateful to it for the warning that had preserved him, insisted on its staying. For weeks it was the cause of constant quarrelling between the pair, until at last the usually pacific man thrashed his wife soundly, and obtained peace.

But she would never allow it to touch her or the baby. The other children, however, loved and welcomed their new playfellow, and rolled with it all day long on the floor of the cave or on the strip of grass outside the entrance. They named it Lion, persuaded from its fearlessness that the spirit of the ferocious beast that had died on the threshold had entered its little body. It very soon proved that it was more than a

child's toy, for one night, when all lay sleeping on the deerskins that served them as beds, its growling awoke them, and they heard some beast of prey snuffing at the stones with which Koto had as usual blocked the entrance to the cave, and trying to pull them away. Koto rose and clambered up to a narrow hole that he had made, opening onto a ledge above the mouth of the cavern. He thrust a stout pole out through it, and pushed with this until he dislodged a pile of rocks that he kept heaped up on the ledge for such occasions. The big stones crashed down on the unseen animal, which, battered and bruised, bolted in terror.

The young dog was soon always to be relied on to warn them of danger; and so Koto took to sending it out of the cave every morning, and waited safely inside until he understood from his four-footed scout's manner that it was safe to emerge himself.

IV.

Lion grew rapidly, and before many months had passed was bigger than a wolf. The dog always accompanied Koto out hunting, for it had speedily shown itself useful in the chase. It gave its master early intimation of danger, and warned him when they were near game; and it pulled down wounded deer, or held them until he could come up and kill them.

Many and varied were the adventures of the pair, narrow their escapes from death, as they roamed the forests or ranged far and wide over the upland downs. Other human hunters, seeing this novel association, whispered that the dog was an evil spirit, a fitting companion for the man who had outraged old custom by wearing clothes and living in a cave.

Koto paid no heed to them, but went his way with the faithful companion that shared his dangers and was always ready to give its life for him. In order not to have to abandon the dog whenever he was obliged to take refuge in a tree from some dangerous beast, he taught it to grip the back of his jerkin collar with its teeth, place its paws over his shoulders, and cling to him while he climbed up out of harm's way. This trick often saved Lion's life. Once as they pursued an antelope through the forest they burst suddenly into an open glade in which an enormous animal was browsing on the leaves of a tree. It was a baluchitherium, the greatest of all varieties of rhinoceros. It stood thirteen feet at the shoulder, and its neck, relatively as long as a horse's, gave it an additional reach of four or five feet when it raised its great head to feed on the branches above it. It had no horns; but two long, down-growing ivory tusks served it as deadly weapons of defence instead.

Like all the rhinoceros family, the brute, although not carnivorous, was liable to fits of blind rage; and now, seemingly annoyed at being disturbed, it looked around for someone

to vent its anger on. The antelope had vanished ; but the great brute's fierce eyes fell on the man, who rushed for the nearest tree. Unluckily, this had no branches for twenty or thirty feet above the ground ; so Koto turned in desperation to look for a more accessible one.

The nearest that was climbable stood at the other end of the open space, and as he ran for it the monster charged him. Clumsy though it seemed, it moved swiftly ; and Koto, glancing over his shoulder, saw with horror that it was rapidly overtaking him. He gave himself up for lost. The enormous head towered over him as the rhinoceros lifted it high in the air to give him a crushing downward blow with its tremendous tusks.

But at the crucial moment the beast squealed shrilly and swayed away to one side ; for the gallant dog had dashed in and given it a raking bite in the hind-leg, a bite that shore through tendon and sinew and almost hamstringed the monster, which stopped in bewilderment and looked around for its assailant. When it saw the dog it grunted fiercely and, forgetting the man, charged at it. Lion dodged the rush, and as the rhinoceros turned and dashed at it more angrily than before, fled into the undergrowth. The great beast crashed noisily in after it ; but as the miraculously-saved Koto got to the tree and reached up to grasp the lowest branch the dog ran out of the bushes and came to him.

Despite the imminent danger he could not abandon the faithful animal ; so he knelt down, and Lion sprang on his back, gripped the collar of his garment with its teeth, crooked its paws over his shoulders, and held on firmly to him as he pulled himself up into the tree, just in time to get out of reach as the baluchitherium burst into the glade again and charged towards them. When the baffled monster realised that its prey had escaped, it pressed its forehead against the trunk and tried to push the tree down. Finding the task too much even for its giant strength, it gashed the bark with its curving tusks in impotent fury. While it thus vented its wrath foolishly Koto climbed into the next tree and went on through the forest high above the ground as adroitly as a monkey, the dog on his back gripping him firmly.

But even when he got back to the cave and told Ra, his wife, what Lion had done for him she still persisted in regarding the dog with hostility ; for she was convinced that some day it would reveal its savage nature and attack them. But the day came when she changed her opinion.

v.

The child that she had been nursing when Lion first entered their life had been succeeded by a new baby. One morning, when Koto was digging for flints some distance down the hill

with a pick made from a reindeer's antler, and the mother was gathering leafy branches to lay under the skins that formed their beds, all the children were playing on the grass before the cave. Ra had given the three eldest strict injunctions to guard the baby ; but, seeing the father and Lion climbing up to them, they ran to meet him, leaving it on the ground, wrapped up in a soft deerskin.

Suddenly a shadow seemed to pass across the sunlit sward. One of the children turned and screamed. A spotted cave-hyena had stolen down from the cliff above, leapt noiselessly on to the grass, and snatched up the baby in its strong jaws. With one bound it vanished into the bushes.

At the child's cry Ra came running along the path, and Koto climbed up the rocks as fast as he could, ignorant of what had happened, but knowing that some danger threatened their offspring. But swifter than either, Lion sprang ahead of his master, sniffed the ground, and then without hesitation started off on the hyena's track. It had vanished before the distracted mother had reached the other children and learned from them her baby's fate.

She shrieked the truth to her husband as he came up. Flinging down his pick, he snatched up a spear and rushed wildly after the dog. He caught a glimpse of it just as it disappeared among scattered trees and undergrowth on the hillside. But he lost its trail and, mad with despairing rage, stood irresolute, not knowing which direction to take.

Suddenly he heard a whimper, a snarl, and the awful scream of a hyena, and sprang towards the sound. In an open space he came upon the spotted ravisher struggling fiercely with the dog. Although the brute was twice its size and weight, Lion had seized the hyena's throat, and, though swung wildly round, and battered against the ground, the brave animal never relaxed its grip.

Koto's heart seemed to stop, for there was no sign of the baby. He dashed to the struggling pair and, when the hyena swung round towards him, drove his spear into its heart. As he plucked his weapon out the blood spurted from the wound and the hyena fell on the ground dead. But Lion still held its throat until his master opened the clenched jaws. Then the dog, followed by its master, ran into the undergrowth and with a joyous whimper nosed out the baby, lying still wrapped up in the deerskin, crying but unhurt. It was evident from the teeth-marks that the hyena had gripped the leather and so inflicted no injury on the child.

Lifting the baby up, and assuring himself of the welcome truth, Koto patted the bruised and bleeding dog, and ran back towards the cave. With streaming eyes Ra met him on the way, and like a mad thing snatched the infant from his arms. Tearing the deerskin from it, she examined it all over before she could believe

his assurance that the baby was unhurt. She mouthed its hairy little body, and smothered it with fierce caresses.

Not until they had reached the cave did she recover her senses sufficiently to listen to her husband's story. But when at last she realised that she owed the life of her child to the animal

that she had always distrusted, she knelt down beside Lion as it lay licking its wounds and, putting her arms round its neck, pressed the great head fondly to her bosom.

And that is how the dog first came to be accepted as Man's faithful friend in dog-loving Britain.

WIRELESS VERSUS CABLES.

By GEORGE E. CLARKE.

SENATOR MARCONI'S recent announcement of his startling experiments with the 'Beam' short-wave system of transmission, which it is claimed will revolutionise the whole business of long-distance electrical communication, has again revived the query, first raised over twenty years ago, 'Will wireless supersede the cables?'

The Marconi Wireless Telegraph Company has now been in operation for seventeen years, in active competition with the cable companies, and there can be no question as to the miraculous strides made, particularly in the last few years, in this almost uncanny means of communication.

When commercial transatlantic communication first took place in 1907 between Clifden, County Galway, Ireland, and Glace Bay, Nova Scotia, the working speed was seldom, if ever, more than ten words per minute, a very laborious proceeding. Even at this painfully slow rate, numerous lengthy interruptions took place, particularly during the day, when transmission was impossible owing to atmospheric disturbance. In those days the sending operator formed his dots and dashes by hand, while the receiving telegraphist could manage to read the very anæmic signals only by the use of ear telephones!

Nowadays automatic transmission at a speed of sixty words per minute, both ways simultaneously, between London and New York direct, by the aid of automatic relays installed at the coast stations on both sides of the Atlantic, is the order of the day; while on shorter circuits, like that between London and Paris, a speed of a hundred words per minute in both directions is often maintained for many hours, except during very hot weather, when atmospherics cause considerable trouble and occasional lengthy stoppages.

Even the 'Beam' system apparently will not overcome this atmospheric trouble, as it is generally admitted that 'Beam' transmission is only possible during the hours of darkness and for an hour or so before and after twilight, while the reflectors used in the reception of 'Beam' signals do not prevent interference of other stations working on the same wavelength. The experiments carried out by Mr Marconi between Poldhu, Cornwall, and Sydney, N.S.W., were only possible during seven hours out of the twenty-four, and it would be interesting to know the reason for this limitation.

It may not be generally known that the short-wave or 'Beam' system of wireless transmission is not by any means new. It was first tried by Hertz over thirty years ago; even Mr Marconi himself, when he first came to this country in 1896, experimented with it over short distances, but dropped it in favour of the long-wave, as the latter was found to be much more satisfactory.

Unfortunately there appears to be some hesitancy on the part of the Post Office Research Board in accepting the claims of the 'Beam' system, by the fact of demanding that the tests for the new stations proposed under the Imperial scheme shall continue for such a lengthy period as twelve months before being accepted by the Government as satisfactory.

And now, what of the cables? To those closely connected with the business of Atlantic communication, it is rather astonishing that little or no notice has been taken in either the technical or daily press of the great revolution which is taking place in cable telegraphy.

Previous to the World-war the majority of the Atlantic cables were worked from either Ireland or Penzance, Cornwall, the cable stations in each case being connected with the London offices by ordinary land wires leased from the Post Office authorities; while on the American side, short cables connected the Canadian cable station at Canso (Nova Scotia) with the city office in New York.

A cablegram despatched from London was transmitted by Morse dots and dashes to the cable station in Ireland (or Penzance), where on receipt it was re-transmitted by siphon recorder (a tape machine) to the Canadian station, from where it was again transmitted to New York.

Marvellous improvements have, however, taken place in the operation of cables as well as wireless, and nowadays most of the Atlantic cables are connected up by the introduction of automatic relays, or rotary repeaters, direct between the London city office and the city office in New York, no re-transmission being necessary at any point. Important telegrams can be transmitted and the reply received in less than two minutes between the two cities, and the average working speed is about fifty words per minute, both ways simultaneously, and on some cables sixty words per minute; and this

speed can be maintained during the whole twenty-four hours if necessary.

Recently came news of the most important development in the whole history of submarine cable construction, and the first radical change for over fifty years, in the invention of a new distortionless cable, which, if expectations are realised, will have a considerable bearing upon the relative importance of long-distance wireless telegraphy.

The conductor of this distortionless cable is composed of a special alloy, known as 'Permalloy,' of nickel and iron, which will permit of an increase in speed of transmission by nearly ten times. So great is the increase in speed that it is declared to have a carrying capacity of between three hundred and four hundred words per minute, which will mean of necessity the introduction of multiplex printing telegraphy on submarine cables if full advantage of such tremendous capacity is to be taken.

Ever since the first successful transatlantic cable was laid in 1858, cables have been of essentially the same type—that is, with a copper conductor, although during the intervening years the actual size of the conductor has gradually been increased, until in the most recent transatlantic cable put down by the Commercial Cable Company between New York and Paris, via the Azores, no less than 1100 pounds of copper per mile was used, making it far and away the world's greatest cable, equal in speed to three of the older type.

The feature of the new 'Permalloy' cable, however, is what is known as inductive loading, an idea which dates back many years, being first put forward by that great scientist, Oliver Heaviside, while Dr Pupin, of New York, in conjunction with the Western Electric Company, has been largely responsible for its practical adaptation to submarine cables. The new type of cable is surprisingly like the old, and differs only in the fact that it has a thin tape of 'Permalloy' wrapped round the copper conductor underneath the gutta-percha covering, which permits the electric current to reach the distant end of the cable with its energy concentrated and without any loss of power *en route*. This increased energy makes it possible to transmit the tele-

graphic signals in more rapid succession, thus increasing the working speed of the cable, 150 miles of which were laid a few months ago off the coast of Bermuda for experimental purposes. The very exhaustive tests which took place proved conclusively satisfactory, and the first transatlantic cable of the new type is now being laid between the United States and Italy, via the Azores, by the Western Union Telegraph Company. It is claimed that this new cable will be equivalent to eight of the old type cables and can be operated without additional expense.

Without minimising in any way the epoch-making development in the art of wireless communication, there is undoubtedly still a lot to be accomplished before it will equal, let alone surpass, the improved regular operation of submarine cables—for two reasons. The first is lack of secrecy; a fact so fully recognised by the British Government during the Great War as to cause the closing down of the only transatlantic circuit then operating between Clifden (Ireland) and Glace Bay (Nova Scotia). A further instance has come to light since the inauguration of the wireless service between London and Paris, when it was discovered that telegrams transmitted from London to Paris were picked up in Amsterdam, as well as at other continental points, and this is being done to-day. It may not be generally known, but there is nothing to prevent the picking up of wireless signals, so long as you know the wavelength and possess a sufficiently sensitive valve set, together with a receiving tape machine. The second weakness is that of atmospherics, which are so powerful at times as to prevent transmission altogether, a fact recently confirmed by no less an authority than Sir Charles Bright, F.R.S.E., M.I.E.E., etc.

At the same time it cannot be disputed that wireless has taken a permanent place in the realm of electrical communication, and is rendering, and will continue to render, great service in broadcasting, ship-to-ship and ship-to-shore communication; but the highest authorities are unanimous that it will never be the equal of the cable in responding to the exacting demands of the business community for secrecy, speed, and reliability.

JOHN MACNAB: A COMEDY FOR POACHERS.

By JOHN BUCHAN, Author of *John Burnet of Barns*, *Greenmantle*, &c.

CHAPTER VII.—continued.

WHEN the Hispana crossed the bridge of Larrig His Majesty's late Attorney-General was modestly concealed in a bush of broom on the Crask side, from which he could watch the sullen stretches of the Lang Whang. He was carefully dressed for the part in a pair of Wattie

Lithgow's old trousers, much too small for him; a waistcoat and jacket which belonged to Sime the butler, and which had been made about the year 1890; and a vulgar flannel shirt borrowed from Shapp. He was innocent of a collar; he had not shaved for two days; and as he had

forgotten to have his hair cut before leaving London, his locks were of a disreputable length. Last, he had a shocking old hat of Sir Archie's, from which the lining had long since gone. His hands were sunburnt and grubby, and he had removed his signet-ring. A light ten-foot green-heart rod lay beside him, already put up, and to the tapered line was fixed a tapered cast ending in a strange little cocked fly. As he waited he was busy oiling line and fly.

His glass showed him an empty haugh, save for the figure of Jimsie at the far end close to the Wood of Larrigmore. The sun-warmed waters of the river drowled in the long dead stretches, curled at moments by the faintest western breeze. The banks were crisp green turf, scarcely broken by a boulder, but five yards from there the moss began—a wilderness of hags and tussocks. Somewhere in its depths he knew that Benjie lay coiled like an adder, waiting on events.

Leithen's plan, like all great strategy, was simple. Everything depended on having Jimsie out of sight of the Lang Whang for half-an-hour. Given that, he believed he might kill a salmon. He had marked out a pool where, in the evening, fish were usually stirring, one of those irrational haunts which no piscatorial psychologist has ever explained. If he could fish fine and far, he might cover it from a spot below a high bank, where only the top of his rod would be visible to watchers at a distance. Unfortunately, that spot was on the other side of the stream. With such tackle as his, landing a salmon would be a critical business, but there was one chance in ten that it might be accomplished; Benjie would be at hand to conceal the fish, and he would disappear silently into the Crask thickets. But every step bristled with horrid dangers. Jimsie might be faithful to his post—in which case it was hopeless; he might find the salmon dour, or a fish might break him in the landing, or Jimsie might return to find him brazenly tethered to forbidden game. It was no good thinking about it. On one thing he was decided; if he were caught, he would not try to escape. That would mean retreat in the direction of Crask, and an exploration of the Crask covers would assuredly reveal what must at all costs be concealed. No. He would go quietly into captivity, and trust to his base appearance to be let off with a drubbing.

As he waited, watching the pools turn from gold to bronze, as the sun sank behind the Glenraden peaks, he suffered the inevitable reaction. The absurdities seemed huge as mountains, the difficulties innumerable as the waves of the sea. There remained less than an hour in which there would be sufficient light to fish—Jimsie was immovable (he had just lit his pipe, and was meditating on a big stone)—every moment the Larrig waters were cooling with

the chill of evening. Leithen consulted his watch, and found it half-past eight. He had lost his wrist-watch, and had brought his hunter, attached to a thin gold chain. That was foolish, so he slipped the chain from his buttonhole and drew it through the arm-hole of his waistcoat.

Suddenly he rose to his feet, for things were happening at the far end of the haugh. Jimsie stood in an attitude of expectation—he seemed to be hearing something up-stream. Leithen heard it too, the cry of excited men. . . . Jimsie stood on one foot for a moment in doubt, then he turned and doubled towards the Wood of Larrigmore. . . . The gallant Crossby had got to business and was playing hare to the hounds inside the park wall. If human nature had not changed, Leithen thought, the whole force would presently join in the chase—Angus, and Lennox, and Jimsie, and Davie, and doubtless many volunteers. Heaven send fleetness and wind to the South London Harrier, for it was his duty to occupy the interest of every male in Strathlarrig till such time as he subsided with angry expostulations into captivity.

The road was empty, the valley was deserted, when Leithen raced across the bridge and up the south side of the river. It was not two hundred yards to his chosen stand, a spit of gravel below a high bank at the tail of a long pool. Close to the other bank, nearly thirty yards off, was the shelf where fish lay of an evening. He tested the water with his hand, and its temperature was at least sixty degrees. His theory, which he had learned long ago from the aged Bostonian, was that under such conditions some subconscious memory revived in salmon of their early days as parr when they fed on surface insects, and that they could be made to take a dry fly.

He got out his line to the required length with half-a-dozen casts in the air, and then put his fly three feet above the spot where the salmon were wont to lie. It was a curious type of cast, which he had been practising of late in the early morning, for by an adroit check he made the fly alight in a curl, so that it floated for a second or two with the leader in a straight line away from it. In this way he believed that the most suspicious fish would see nothing to alarm him, nothing but a hapless insect derelict on the water.

Sir Archie had spoken truth in describing Leithen to Wattie Lithgow as an artist. His long, straight, delicate casts were art indeed. Like thistledown the fly dropped, like thistledown it floated over the head of the salmon, but like thistledown it was disregarded. There was, indeed, a faint stirring of curiosity. From where he stood Leithen could see that slight ruffling of the surface which means an observant fish.

Already ten minutes had been spent in this barren art. The crisis craved other measures.

His new policy meant a short line, so with infinite stealth and care Leithen waded up the side of the water, sometimes treading precarious ledges of peat, sometimes waist-deep in mud and pond-weed, till he was within fifteen feet of the fishing-ground. Here he had not the high bank for a shelter, and would have been sadly conspicuous to Jimsie, had that sentinel remained at his post. He crouched low, and cast as before, with the same curl, just ahead of the chosen spot.

But now his tactics were different. So soon as the fly had floated past where he believed the fish to be he sank it by a dexterous twist of his rod-point, possible only with a short line. The fly was no longer a winged thing; drawn away under water, it roused in the salmon early memories of succulent nymphs. . . . At the first cast there was a slight swirl, which meant that a fish near the surface had turned to follow the lure. The second cast the line straightened and moved swiftly upstream.

Leithen had killed, in his day, many hundreds of salmon—once, in Norway, a notable beast of fifty-five pounds. But no salmon he had ever hooked had stirred in his breast such excitement as this modest fellow of eight pounds. "'Tis not so wide as a church-door,'" he reflected with Mercutio, "'but 'twill serve'"—if I can only land him.' But a dry-fly cast and a ten-foot rod are a frail wherewithal for killing a salmon against time. With his ordinary fifteen-footer and gut of moderate strength, he could have brought the little salmon to grass in five minutes, but now there was immense risk of a break, and a break would mean that the whole enterprise had failed. He dared not exert pressure; on the other hand, he could not follow the fish, except by making himself conspicuous on the greensward. Worst of all, he reckoned he had, at the best, ten minutes for the job.

Thirty yards off an otter slid into the water. Leithen wished he was King of the Otters, as in the Highland tale, to summon the brute to his aid.

The ten minutes had lengthened to fifteen—nine hundred seconds of heart-disease—when, wet to the waist, he got his pocket gaff into the salmon's side and drew it on to the spit of gravel where he had started fishing. A dozen times he thought he had lost; once, when the fish ran straight up the pool, his line was carried out to its last yard of backing. He gave thanks to high Heaven when, as he landed it, he observed that the fly had all but lost its hold and in another minute would have been free. By such narrow margins are great deeds accomplished.

He snapped the cast from the line and buried it in mud. Then cautiously he raised his head above the high bank. The gloaming was gather-

ing fast, and, so far as he could see, the haugh was still empty. Pushing his rod along the ground, he scrambled onto the turf.

Then he had a grievous shock. Jimsie had reappeared, and he was in full view of him. Moreover, there were two men on cycles coming up the road, who, with the deplorable instinct of human nature, would be certain to join in any pursuit. He was on turf as short as a lawn, cumbered with a tell-tale rod and a poached salmon. The friendly hags were a dozen yards off, and before he could reach them his damning baggage would be noted.

At this supreme moment he had an inspiration, derived from the memory of the otter. To get out his knife, cut a ragged wedge from the fish, and roll it in his handkerchief was the work of three seconds. To tilt the rod over the bank so that it lay in the deep shadow was the work of three more. . . . Jimsie had seen him, for a wild cry came down the stream, a cry which brought the cyclists off their machines and set them staring in his direction. Leithen tossed his gaff after the rod and began running towards the Larrig bridge—slowly, limpingly, like a frightened man with no resolute purpose of escape. And as he ran he prayed that Benjie from the deeps of the moss had seen what had been done and drawn the proper inference.

It was a bold bluff, for he had decided to make the salmon evidence for, not against, him. He hobbled down the bank, looking over his shoulder often as if in terror, and almost ran into the arms of the cyclists, who, warned by Jimsie's yells, were waiting to intercept him. He dodged them, however, and cut across to the road, for he had seen that Jimsie had paused and had noted the salmon lying blatantly on the sward, a silver splash in the twilight. Leithen doubled up the road, as if going towards Strathlarrig, and Jimsie, the fleet of foot, did not catch up with him till almost on the edge of the Wood of Larrigmore. The cyclists, who had remounted, arrived at the same moment, to find a wretched, muddy tramp in the grip of a stalwart but breathless gillie.

'I tell ye I was daein' nae harm,' the tramp whined. 'I was walkin' up the water-side—there's nae law to keep a body frae walkin' up a water-side when there's nae fence—and I seen an auld otter killin' a saumon. The fish is there still to prove I'm no leein'.'

'There is a fush, but you wass thinkin' to steal the fush, and you would have had it in your breeks if I hadna seen you. That is poachin', ma man, and you will come up to Strathlarrig. The master said that any one goin' near the watter was to be lockit up, and you will be lockit up. You can tell all the lees you like in the mornin'.'

Then a thought struck Jimsie. He wanted the salmon, for the subject of otters on the

Larrig had long been a matter of dispute between him and Angus, and here was evidence for his own view. 'Would you two gentlemen oblige me by watchin' this man while I rin back and get the fush? Bash him on the head if he offers to rin.'

The cyclists, who were journalists out to enjoy the evening air, willingly agreed, but Leithen showed no wish to escape. He begged a fag in a beggar's whine, and, since he seemed peaceable, the two kept a good distance for fear of infection. He stood, making damp streaks in the dusty road, a pitiable specimen of humanity, for his original get-up was not improved by the liquefaction of his clothes and a generous legacy of slimy peat. He seemed to be nervous, which indeed he was, for if Benjie had not seized his chance he was utterly done, and if Jimsie should light upon his rod he was gravely compromised.

But when Jimsie returned in a matter of ten minutes he was empty-handed. 'I never kenned

the like,' he proclaimed. 'That otter has come back and gotten the fush. Ach, the maleecious brute!'

The rest of Leithen's progress was not triumphant. He was conducted to the Strath-larrig lodge, where Angus, whose temper and wind had alike been ruined by the pursuit of Crossby, laid savage hands upon him, and frog-marched him to the back premises. The head-keeper scarcely heeded Jimsie's tale. 'Ach, ye poachin' va-agabond. It is the jyle ye'll get,' he roared, for Angus was in a mood which could only be relieved by violence of speech and action. Rumbling Gaelic imprecations, he hustled his prisoner into an outhouse, which had once been a larder and was now a supplementary garage, slammed and locked the door, and, as a final warning, kicked it viciously with his foot, as if to signify what awaited the culprit when the time came to sit on his case.

SOME ARCTIC NOTES.

By G. LINDESAY.

FROM one cause or another Norway has of late years become associated more closely with some of the Arctic island groups than was the case before the War, and she now despatches annually a large fleet to these far northern regions in pursuit of the various animals and birds which exist there. These vessels operate throughout the spring and summer months, both among the so-called 'Eastern Ice' (that is to say, the tract of ocean which lies between the Russian Coast—Novaja Semlja in the south-east and Bear Island—Spitsbergen in the north-west) and the Western Ice (between Spitsbergen and Greenland). Here the Greenland Seal (*Phoca groenlandica*) may be said to be the most important object of pursuit, together with—in the western region at any rate—the Hooded Seal or 'Klapmyds' (*Cystophora cristata*).

The two species which are most common in summer on the coasts of Spitsbergen and Novaja Semlja are the Bearded Seal or 'Storkobben' (*Ph. barbata*), and the Ringed Seal or 'Snadden' (*Ph. foetida*). The former is the largest of the seal tribe in the northern Arctic, and attains a length of about ten feet. It is highly valued on account of the quantity of blubber which it yields, and for its skin, which is reckoned the best for the construction of boats, kayaks, sleighs, dog harness, etc. It keeps near the land in shallow water and is frequently met with in the fjords. In warm, still weather, it lies out on the ice floes and is then not difficult to approach. In stalking these animals amongst the drift ice large white-painted boats are employed, and instead of ordinary rowlocks, rings of rope are used, so as

to minimise the noise made by the oars. The ringed seal is common in the fjords throughout the summer. In the open water, where it is most frequently met with, there is little use in shooting at it, as, when killed, it sinks at once.

The walrus has ceased to exist on the west coasts of Spitsbergen and Novaja Semlja, but to the east and north of these groups considerable numbers are still to be found. On Bear Island they were very plentiful about a hundred years ago, and there they were slaughtered in thousands by the 'Fangstmaend' (professional hunters).

On the east and north coasts of Novaja Semlja the polar bear is still met with occasionally. It has a distinct preference for the drift ice, where it finds the seals, which constitute its principal food. In stalking its prey it exhibits great skill, and it is even said by hunters to conceal with a fore-paw the only black spot it possesses—namely, its nose.

When the ice approaches the shore bears sometimes land, but, there being few attractions in the shape of food, they do not generally remain there long. In winter they follow with the drift ice southwards, and have even been known to reach Finmarken. Young ones are not infrequently captured alive after the death of the mother and brought to Norway, their ultimate destination being usually a zoological garden or a menagerie. I recollect travelling in the society of one all the way from the North Cape to Bergen, and a more noisy little beast I never saw. Although liberally supplied with food, it kept roaring for more,

night and day; and when on one occasion it succeeded in breaking out of the strong cage in which it was confined, the combined efforts of passengers and crew were required to secure it again.

The only large land mammal in Spitsbergen and Novaja Semlja is the reindeer; the musk ox, which is of comparatively frequent occurrence in some parts of Greenland, does not exist on either of these two groups. On the western coasts there are very few deer left, but in the north and east there is still a considerable stock, owing mainly to the inaccessibility of these parts. Professional and amateur hunters have done their best to exterminate this noble animal. In 1891 Prince Henry of Bourbon's party shot 78, and the following year 114. The question as to how reindeer originally reached Spitsbergen has been much discussed, in view of the great tract of ocean which lies between it and the European continent. It would seem, however, that they must have come from north Russia (where, on the island of Vaigatsch, the Samoyedes keep tame deer), by way of Novaja Semlja and Franz Josef's Land, traversing the intervening tracts of sea on the ice in winter.

The Spitsbergen reindeer is smaller than the Norwegian and Greenland rein. It also differs somewhat from these in structure, and it has a comparatively shorter and broader skull. Its summer coat is rather darker than that of the Norwegian wild rein. In spring, it is so thin and in such poor condition that its flesh is hardly eatable. It is not long of recovering, however, and already at the end of July it has a thick layer of white fat between the skin and the flesh. During the long, dark arctic winter the animal absorbs this fat, so that in spring it has entirely disappeared.

When Spitsbergen was first discovered the Greenland Whale (*Balaena mysticetus*) frequented the surrounding waters in vast numbers, and in the first half of the seventeenth century the English and the Dutch carried on a whale fishery there, which was so lucrative that the Spitsbergen group came to be called the Gold Mine of the North. Ruins of the great establishments erected in connection with the fishery may still be seen on the west coast. This period of prosperity, however, did not last long. In the neighbourhood of Spitsbergen the Greenland whale soon ceased to exist, and after a time the vessels, in order to find any, had to go so far towards the east coast of Greenland that it no longer paid them to have stations in Spitsbergen. For the present the Greenland whale has disappeared from the east coast of Greenland.

The great 'fin whales' or rorquals arrive in summer in the waters between Spitsbergen and Finmarken, and in ice-free years they also show themselves in the seas to the west of Spitsbergen. The Grampus (*Delphinus orca*) and the Bottlenose (*Hyperoodon*) have a more western

distribution—between Iceland and the drift ice round Ian Mayen.

The Narwhal (*Monodon monoceros*) lives among the drift ice and is therefore oftener seen on the north coast of Spitsbergen, but it would seem to be most frequently met with among the ice between that group and Greenland. The Beluga (*Delphinapterus leucas*) frequents the inner fjords, where it may often be seen pursuing the pollack along the edge of the glaciers discharging into these. It is captured with heavy, large-meshed nets. The polar fox is common on the Arctic islands, but its fur is valuable only in winter, when large numbers are trapped by the 'Fangstmaend.' It is partial to the vicinity of the coast, where it lives mainly on the sea-fowl which swarm there and on their eggs.

Of the Arctic fauna the birds are the most prominent feature during the summer months, and the great colonies, with their myriads of inhabitants closely packed together on the rocky ledges and filling the air with their cries, present a most remarkable and interesting spectacle. Of the Spitsbergen Auk or Guillemot (*Uria bruennichi*) there is an enormous colony near the southern end of Bear Island, and for miles along the coast of Novaja Semlja the cliffs swarm with these pretty black and white birds.

On the skerries and islets the eider breed in immense numbers. Their eggs and those of several other kinds of sea-fowl are much appreciated by the 'Fangstmaend,' constituting, as they do, a pleasing change from the monotonous food to which they are accustomed on board ship. A peculiarity of the eider in the Arctic regions is that the male remains with its mate until a short time before the young are hatched out; in Norway he leaves her as soon as she begins to sit.

The King Eider (*Somateria spectabilis*) is fairly common at several places on the west coast of Spitsbergen, but appears to vary greatly in numbers from year to year. On Bear Island it does not seem to breed.

According to Professor Grilg of the Bergen Museum, in his latest disquisition on the fauna of Spitsbergen, fifty-two kinds of birds have been observed there, and of these twenty-five breed; the corresponding numbers for Bear Island being thirty-six and sixteen. No birds of prey breed on either, but the snowy owl and the falcon have been seen on the former.

Some of the small lakes near the coast of Novaja Semlja are frequented by large numbers of wild geese, and on the western side of that group there is an extensive tract of low-lying country called 'Gaase Land,' where in summer vast flocks of these birds are to be seen.

The only permanent bird resident in Spitsbergen is a form of ptarmigan (*Lagopus hyperborea*), which closely resembles the Norwegian 'fjeld rype.' On Bear Island it does not exist.

Chambers's Journal

SEVENTH SERIES

TWENTY-FOUR HOURS ON PICQUET DUTY.

By Lieutenant H. P. CINNAMOND, M.C.

I.

'YOU'RE on out-lying picquet to-night, Jones, so you can turn in this afternoon, if you like. I'll have your men fallen in for you at four o'clock. Don't oversleep yourself.'

'Good Lord!' grumbled Second-Lieutenant Jones, 'this is the third time this week that I've been on picquet.'

'It is a bit hard,' agreed Tyrrel, his company commander, 'but there's only you and Burton for it, and as Burton came off duty last night he can hardly be expected to go on again to-night, can he? I should take a turn myself were it not against orders. Now toddle off and get your beauty sleep. I'll see you at four.' So saying, he strolled away, leaving the other to curse his luck, the Frontier Force, Afghanistan, and life in general, as he made his way to the 'E.P.' tent shared with three other spirits more genial than himself.

At four o'clock Jones received final instructions from his company commander, who awaited him beside the little body of men, drawn up on the tiny square forming the centre of the perimeter camp, who were to form the picquet.

As Jones saluted, Tyrrel informed him that the men were ready to be marched off; that he had inspected them. 'I've given you twenty-five men and three N.C.O.'s,' he continued. 'I'm also giving you two Lewis guns, because you'll have to split your picquet up; it's the river picquet.'

'Thank the Lord!' ejaculated Jones. 'I was afraid it was going to be Green Hill again—I nearly died climbing it last time. Whom am I taking over from?'

'From the — Sikhs. Subadar-Major Gholab Singh is there now with thirty men.'

'An Indian officer!' grumbled the discontented youth. 'Surely if they can put an Indian officer in charge we ought to be able to put a warrant officer in command of our lot?'

'Gholab Singh is a Viceroy's commission,' answered Tyrrel shortly, 'and when you know as much about border warfare as he does you may hope to command a division, if you're not dead. Now get along; everything's correct here—rations, water, bombs, s.a.a., guns, spare parts, etc. See that you check the ammunition

you take over from the Sikhs. They did a lot of firing last night, so don't take their boxes as being full if they are not. Those disciples of Guru Nanak like a few spare rounds about them that they don't have to account for. Don't forget to report every hour through the night. Your signallers' stuff is all correct. Right-o! March off. The men are numbered.'

A sharp 'To the right in fours—form fours—right—left wheel—quick march!' and the little column with Jones at its head moved off to its destination, the river picquet.

II.

After leaving the fortifications, a deep ditch with a parapet thrown up on the inside, a right wheel followed by a half-right as they cleared the perimeter headed them for their objective, a line of hills, which lay some half-mile away across the dusty Dakka plain, extending in a low spur to the Kabul River. Up the spur a narrow path, well-worn by the feet of many picquets, ran to the walled sangars at the top; along this the little force marched.

Arrived at the sangar, Jones halted his men while he, with his senior N.C.O., went forward to arrange for the relief of the garrison.

A tall, heavily-built man, wearing the badges of a Subadar-Major, came out of the sangar to greet them; a man to be remembered, Gholab Singh, a Sikh of the military caste, a class to which India—indeed, the Empire—owes some of her finest soldiers; that caste which, before the days of the British Raj, drove the Afghans from the Punjab.

As the Subadar-Major advanced, even Jones, who, being freshly out from home, was rather apt to class all natives generically as 'niggers,' was compelled to admit to himself that he had seldom seen a finer man. Tall and strongly-built, his great chest bearing medals, some of which Jones had never seen before, spoke of the long and arduous nature of his service. The face, framed in its heavy beard, the latter coiled Sikh fashion, was strikingly handsome. The broad high forehead, only partly concealed by the Sikh puggri, the wide-set dark eyes, and the hawk-like nose combined to make a picture not easily forgotten.

Saluting punctiliously, he addressed Jones in

Urdu, to which Jones, feeling like a very small child, could only reply by shaking his head, when the Subadar-Major hastily changed to English.

The sahib had come to relieve his picquet? Good! If the sahib would come with him he would have pleasure in handing over to him. Had the sahib been on this particular picquet before? No? Then perhaps the sahib would like to see the dispositions which he had made of his force the night before? This diffidently.

Yes, the sahib would certainly like to see the Subadar-Major's dispositions.

'By day, sahib,' began Gholab Singh, leading the way into the sangar, 'I have but one sentry—there!' pointing to a man on duty beside a pile of arms; 'that is sufficient. He can command all the country from that point; he can watch both the camp for signals and the hills for the enemy.'

'At night I have four double posts, three in this sangar and one with the Lewis gun post, where the spur overhangs the river.'

Jones glanced around the sangar. It was a big one of an oblong shape, some sixty feet long by twenty wide, running from north to south along the slope of the spur. Its construction was simple—merely a wall five feet in height enclosing the afore-mentioned space, a wall some two feet thick built of the stones and boulders which lay strewn about in profusion on the hill-top.

The Subadar-Major led Jones to the southern end of the sangar. 'Here, sahib,' he said, 'I place my No. 1 group. It can overlook that portion of the hill which is dead ground to the picquet on Black Hill; also it can keep connection with it.'

'I have my No. 2 post on the western side; it overlooks the slope over which any attack, save from the river, must develop itself if it is to avoid other picquets.'

'My No. 3 group is placed at the extreme north point of the sangar. Its duty is to watch the ground between ourselves and our subsidiary post on the river bank, and to maintain connection with the latter, where No. 4 group is situated.'

Together they left the main sangar, and climbing out along the rocky spur which abutted on the river, they came to the Lewis gun post, where they found six men under a naik (corporal). One of the men was peering across the river and paid no attention to the two officers.

'This,' said Gholab Singh, 'is the position occupied by No. 4 group. Its duty is to watch the far bank of the river and to maintain connection with the main picquet. As you see, it is impossible for an attack to be made on it from the land side without first forcing the main sangar. But, nevertheless, it is an uncomfortable post, for it is under fire practically the whole night from darkness until dawn. As soon as darkness falls the snipers assemble on that ridge on the far bank of the river—that low ridge, sahib, running east and west at the back of the

town of Lalpura. The range is 1400 yards to the eastern point of the ridge, and 1250 to the western point. In spite of the distance and the darkness the swine make pretty good shooting.'

'And we're supposed to be at peace with the Mohmands,' growled Jones; 'I should think a few shells from our six-inch howitzers in their capital Lalpura would make them think twice before they sniped us again.'

'Ah! sahib,' replied the Subadar-Major, 'it is not the Mohmands who do it. They will not readily fight again against the British Raj—they had their lesson three years ago. It is the Afghans, with, perhaps, a few budmash Mohmands, who cross the river and do the sniping, hoping, no doubt, to draw the Mohmands into the war in this manner.'

He led the way back to the main sangar, where the stores, ammunition, bombs, Very lights, Very pistols, etc. were checked. Receipts for the amounts taken over were entered in the picquet log, a book which, like Tennyson's stream, goes on for ever, in spite of the comings and goings of men. In it is entered, along with matters of daily routine, every item which may concern the well-being of its temporary inmates, including range-cards of the surrounding country, details of attack and defence, suspicious objects seen, with time, place, range and compass bearing complete. It is in fact a compendium of useful information, and many a raw subaltern who has cursed while entering the minutiae of the daily routine has found it a godsend when confronted with an awkward situation.

Next the daylight sentry was posted, after which the Subadar-Major's men marched out and Jones's men marched into the sangar. The Lewis gun post was similarly relieved, when the Sikhs swung down the hill and marched off to camp.

III.

Left alone, Jones called a signaller to him and ordered him to report the relief complete to the camp. When the heliograph ceased winking he sent for the sergeant, and taking him around the position, showed him where he intended posting his sentries for the night.

'We will "stand-to" from seven to eight and from five to six in the morning, which will give you three reliefs of three hours each. The Lewis gunners in the lower sangar will find their own sentries. Tell Corporal Smalley so, and give him the hours for the reliefs. You and I, sergeant, with Corporal Buckley, will do the rounds. I don't want Smalley to leave his post at all. Better let Buckley take the first watch from eight to eleven; then, if you take the middle watch until two, I'll take from that until "stand-to," when we'll mount the day sentries. You'd better get along now and fix up the reliefs. See that the Lewis gunners in the lower sangar have their rations sent to them. I don't want them to come up here at all.'

Left to himself again, Jones wandered about idly; the Sikhs, with characteristic discipline, had left the place spotlessly clean, so there was no tidying up to be done, as there generally is after taking over from British troops.

He watched the construction of a sanitary trench, and instructed the men that it must be used before the night sentries were mounted, as from that time until the dawn 'stand-down' no man would be allowed to leave the sangar. He saw that the *chagals* containing water were placed in a shady and protected spot. Then, in the few minutes' leisure before the evening 'stand-to,' he surveyed the country round about.

Looking towards the west, he had before him, extending from the foot of the hill on which he stood to the town of Jelalabad, some thirty miles distant, a rich and well-cultivated plain, only a couple of miles in width in his immediate vicinity, but broadening as it receded until it reached a maximum of some twenty-five miles; the whole well watered by the Kabul River, flowing past him a bare fifty yards to his right and a good half-mile in width at that spot, its broad bosom broken here and there by small islands, its farther bank cultivated—from the water's edge to where, only a few hundred yards back, the outlying spurs of the Pusht-i-Kuh push forward—by the inhabitants of Chiknao and Lalpura.

The spur on which he stood, dividing the Jelalabad plain from the Dakka plain, where the British force lay, ran back to a chain forming part of the Safedh Kuh range. This same spur was broken some four hundred yards south of his own position by a tiny pass only a few yards wide—yet that little pass is the Khud Khaibar, or the Khaibar Gate, down which a great portion of the trade of Asia passes every year on its way to India.

At the hour of seven Jones gave the order to 'stand-to,' while he with the sergeant walked round the position; the night sentries were mounted and given their orders; each man was shown the exact position which he would occupy in the case of an alarm, and was instructed to sleep as close to it as possible. Jones assured himself that every man knew where bombs, ammunition, Very lights, and Very pistols could be obtained, and that they knew the alarm signals—the local alarm a series of short blasts on a whistle; the general, to warn the camp, three red flares from the Very pistols. Next the picquet range-cards were explained in order that they might judge their distances in the light of known ranges; after which 'stand-down' was ordered, when such men as were not on duty retired to rest.

IV.

As darkness fell the first of those signals which must be sent every hour winking through

the night to reassure the sleeping camp, the 'All's Well,' was sent. A few minutes later sparks of flame on the Lalpura ridge announced that the snipers had commenced their night's work; desultory shots at first, but growing into a fair demonstration of volley firing directed in about equal quantities at the camp and the river picquet, the only objects within range when firing from the ridge. Considering the darkness, the long range, and the fact that many of their weapons were of the old long-barrelled jezail type, the Afghans made very fair shooting, and soon bullets were pattering quite briskly on the rocks around, above and below the picquet. So far none had fallen within it, and even did they do so, they were likely to do but little harm, as the men were sleeping close under the lee of the northern wall. Of course, the sentries might be hit, as they could not take cover, it being most necessary that a bright look-out be kept during the more fierce bursts of fire, as it was possible the enemy might use them as an aid to an advance on the picquet.

Jones with his orderly left the sangar, and, at some risk, both from the nature of the climb and the sentries below, proceeded to the lower sangar. After being recognised by the sentry there he was admitted. 'I think, Corporal Smalley,' he said, 'we'll give these fellows an answer; it's no use letting them have it all their own way, what?'

'Very good, sir,' replied the corporal; 'I'll just traverse that bit of a ridge where the flashes seem thickest.'

Slipping forward the safety-catch of the gun lying ready in its embrasure, he raised the butt to his shoulder, and settling himself comfortably on a couple of ammunition boxes, he glanced along the luminous sights and pressed the trigger. A hoarse rattle like the tearing of canvas rang out and died away in the night, when, charging the now empty magazine with a full one, the corporal let the butt slide from his shoulder.

A slight lull followed on the other side of the river. 'That'll do for the present,' said Jones. 'Give them a magazine every hour or so just to show them we're not asleep.'

Ascertaining that the sentries were alert and understood their jobs, the officer bade the corporal good-night and returned to the main sangar, where he made his rounds, and receiving the 'All's Well!' from the three posts there, proceeded to send that message winking back to the camp. After watching the lamp—carefully shaded as to sides and rear—for a little while, he retired to his couch—that is, a waterproof sheet, with his greatcoat for a pillow.

V.

Jones was awakened by a gentle pressure on the shoulder. Opening his eyes, he was aware of the sergeant's figure bending over him. A

low 'hsh' came from the latter's lips before, straightening himself, he signed to Jones to follow him.

Arrived at No. 2 sentry post, the sergeant stood for some time in a listening attitude. At first Jones could hear nothing, then a very faint 'click' was borne to his ears.

'Did you hear that, sir?' whispered the sergeant, putting his mouth close to the officer's ear.

Jones nodded. 'Stand the men to,' he whispered, 'but no noise.'

Silently man after man was touched, and silently each man rose to his feet and took up his prearranged position, his rifle loaded and his bayonet fixed, to await the rush which all knew was preparing out there in the dark. The wicked muzzle of the Lewis gun peeped over the stones, while dark egg-shaped objects lay ready to the bombers' hands.

Now, in the dead silence, the gentle click and rattle of disturbed stones was clearly audible, even a guttural word of Pushtu could be heard. The attacking party could not be more than thirty yards below them, Jones thought. The time had come to act.

Raising a Verry pistol, he discharged it. The flare, soaring into the air, lit the scene as by day, revealing on the slope below a dark mass, which surged upwards towards the sangar wall. But the slope was steep, and the Afghans were never destined to reach their goal. The Lewis gun blared its message, a dozen little egg-shaped toys trickled gently towards them, and—the fight was over.

For half an hour the inmates of the sangar 'stood-to'; but, save for a groan now and then, or a call to Allah by the stricken below, their peace was unbroken. The 'stand-down' was ordered, the lamp flickered its eternal 'All's Well' to the expectant camp, and once more sleep reigned supreme.

VI.

Duly awakened by the sergeant at two o'clock, Jones made his rounds three times, and each time the lamps winked their message of security through the night. Save for an occasional magazine discharged at the snipers across the river, the peace was unbroken.

The dawn 'stand-to' found the little garrison waiting in eager expectancy to view the scene of the over-night battle. But if they expected to find the ground strewn with corpses they were mistaken. Blood there was in plenty, but the Faithful do not leave their dead to be desecrated by Infidel Dogs.

Then came 'stand-down,' the posting of the day sentries, and breakfast—a merry little meal of bully beef, bread, and cheese, washed down by tea, hot and sweet, and strong enough to stand on.

After breakfast Jones entered up the events

of the previous night in the picquet log-book, strolled down to the lower sangar to gaze enviously at the river, for the beginning of July in Afghanistan is decidedly hot. Fortunately this same heat melts the snow in the hills, and sends a mighty flood, gloriously cool, rolling down the Kabul; and Jones, as he looked, promised himself a long, cool swim as soon as his relief was completed. He went back to the upper sangar, where shelters were erected out of waterproof sheets and rifles.

At eleven o'clock the water mule arrived, leaving two full eight-gallon *chagals* in place of those emptied, which it took away. Then the ration beast and lunch, very similar to breakfast, and so the day wore on until tea, broken by the 'All's Well' signal at three hours' intervals.

After tea the welcome message: 'You will hand over to the — Ghurkas. AAA. Report relief complete. AAA. Message ends. AAA.'

Yes, there they come, the small brown hill-men; how little they make of the steep path which the British infantry toiled up so laboriously, and with so many deep-chested curses. Indeed, disdaining the path altogether, they swarm up the side of the hill, and are on the top in no time. The British officer in charge, a cheery young fellow in the black accoutrements of his regiment, comes forward. Greetings are exchanged. He is shown the posts by day and night, positions which he may or may not adopt as he thinks fit. Ammunition and stores are checked, the entries in the log made; he mounts his daylight sentries, then, with a cheery 'so-long,' waves Jones off.

A 'go-as-you-please' down the hill, the men are fallen in at the bottom, and a sedate march back to camp, where they are dismissed, to reassemble some half-hour later on the banks of the Kabul, there to wash away the dust and dirt accumulated during the twenty-four hours' duty.

THOMAS HARDY.

[Thomas Hardy's first published work appeared in *Chambers's Journal* just sixty years ago, March 18, 1865.]

THERE on a star that sheds a pure white ray
Shakespeare with Homer walked, and close at hand

Milton and Dante mused, and quietly planned
Whom of the Earthlings they should choose to say
What their free minds contrived in spirit way

Of import high that man could understand.
Far down a flame of genius they fanned,
And carefully they fed it day by day
With winds of thought which shook one eager man.

And Thomas Hardy felt within his soul
The kindling of a fire whose piercing light
Lit up the Everywhere for him to scan;
Then to his age he showed the Cosmic whole,
As it appeared to his most inward sight.

E. M. FRAMPTON.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER VII.—*continued.*

SIR ARCHIE, if not a skeleton at the feast, was no better than a shadow. The fragment of drama which he had witnessed had divorced his mind rudely from the intelligent conversation of Mr Bandicott; he was no longer slightly irritated by Mr Claybody; he forgot even the attractions of Janet. What was going on in that twilit vale? Lady Maisie's Pool had still a shimmer of gold, but the woods were now purple, and the waterside turf a dim amethyst, the colour of the darkening sky. All sound had ceased, except the rare cry of a bird from the hill and the hoot of a wandering owl. . . . Crossby had beyond doubt been taken, but where was Leithen?

Roylance was recalled to his surroundings by Janet's announcement that Mr Bandicott proposed to take them all in his car to the meeting at Muirtown. 'Oh, I say,' he pleaded, 'I'd much rather you didn't. I haven't a notion how to speak—no experience, you see—only about the third time I've opened my mouth in public. I'll make an awful ass of myself, and I'd much rather my friends didn't see it. If I know you're in the audience, Miss Janet, I sha'n't be able to get a word out.'

Mr Bandicott was sympathetic. 'Take my advice and do not attempt to write a speech and get it by heart. Fill yourself with your subject, but do not prepare anything except the first sentence and the last. You'll find the words come easily when you once begin—if you have something you really want to say.'

'That's the trouble—I haven't. I'm goin' to speak about foreign policy, and I'm dashed if I can remember which treaty is which, and what the French are making a fuss about, or why the old Boche can't pay. And I keep on mixin' up Poincaré and Mussolini. . . . I'm goin' to write it all down, and if I'm stuck I'll fish out the paper and read it. I'm told there are fellows in the Cabinet who do that.'

'Don't stick too close to the paper,' the colonel advised. 'The Highlander objects to "read" sermons, and he may not like a "read" speech.'

'Whatever he does I'm sure Sir Archibald will be most enlightening,' Mr Bandicott said politely. 'I confess I should like to hear Lord Lamancha. We think rather well of that young man in America. How do you rate him here?'

Mr Claybody, as an inhabitant of the great world, replied, 'Very high—in his own line. He's the old-fashioned type of British statesman, and people trust him. The trouble about him and his kind is that they're a little too far removed from the ordinary man—they've been

too cosseted and set on a pedestal all their lives. They don't quite know how to handle democracy. You can't imagine Lamancha rubbing shoulders with Tom, Dick, and Harry.'

'Oh, come!' Sir Archie broke in. 'In the War he started as a captain in a Yeomanry regiment, and he commanded a pretty rough Australian push in Palestine. His men fairly swore by him.'

'I daresay,' said the other coldly. 'The War doesn't count for my argument, and Australians are not quite what I mean.'

The butler, who was offering liqueurs, was seen to whisper confidentially to Junius, who looked towards his father, made as if to speak, and thought better of it.

The older Mr Bandicott was once more holding the table. 'My archæological studies,' he said, 'and my son's devotion to sport are apt to circumscribe the interest of my visits to this country. I do not spend more than a couple of days in London, and when I am there the place is empty. Sometimes I regret that I have not attempted to see more of English society in recent years, for there are many figures in it I should like to meet. There are some acquaintances, too, that I should be overjoyed to revive. Do you know Sir Edward Leithen, Mr Claybody? He was recently, I think, your British Attorney-General.'

Mr Claybody nodded. 'I know him very well. We have just briefed him in a big case.'

'Sir Edward Leithen visited us two years ago as the guest of our Bar Association. His address was one of the most remarkable I have ever listened to. It was on John Marshall—the finest tribute ever paid to that great man, and one which I venture to say few Americans could have equalled. I had very little talk with him, but what I had impressed me profoundly with the breadth of his outlook and the powers of his mind. Yes, I should like to meet Sir Edward Leithen again.'

The company had risen and were moving towards the drawing-room.

'Now, I wonder,' Mr Claybody was saying. 'I heard that Leithen was somewhere in Scotland. I wonder if I could get him up for a few days to Haripol. Then I could bring him over here.'

An awful joy fell upon Sir Archie's soul. He realised anew the unplumbed preposterousness of life.

Ere they reached the drawing-room Junius took Agatha aside. 'Look here, Miss Agatha, I want you to help me. The gillies have been a little too active. They've gathered in some wretched hobo they found looking at the river,

and they've annexed a journalist who stuck his nose inside the gates. It's the journalist that's worrying me. From his card he seems to be rather a swell in his way—represents the *Monitor*, and writes for my father's New York paper. He gave the gillies a fine race for their money, and now he's sitting cursing in the garage and vowing every kind of revenge. It won't do to antagonise the Press, so we'd better let him out and grovel to him, if he wants apologies. . . . The fact is we're not in a very strong position, fending off the newspapers from Harald Blacktooth because of this ridiculous John Macnab. If you could let the fellow out it would be casting oil on the troubled waters. You could smooth him down far better than I.'

'But what about the other? A hobo, you say! That's a tramp, isn't it?'

'Oh, tell Angus to let him out too! Here are the keys of both garages. I don't want to turn this place into a lock-up. Angus won't be pleased, but we have to keep a sharp watch for John Macnab to-morrow, and it's bad tactics in a campaign to cumber yourself with prisoners.'

The two threaded mysterious passages and came out into a moonlit stable-yard. Junius handed the girl a great electric torch. 'Tell the fellow we eat dirt for our servants' officiousness. Offer him supper, and—I tell you what—ask him to lunch the day after to-morrow. No, that's the Muirtown day. Find out his address, and say we'll write to him and give him first chop at the Viking. Blame it all on the gillies.'

Agatha unlocked the door of the big garage, and, to her surprise, found it brilliantly lit with electric light. Mr Crossby was sitting in the driver's seat of a large motor-car, smoking cigarettes and composing a story for his paper. At the sight of Agatha he descended hastily.

'We're so sorry,' said the girl. 'It's all been a stupid mistake. But, you know, you shouldn't have run away. Mr Bandicott had to make rules to keep off poachers, and you ought to have stopped and explained who you were.'

To this charming lady in the grass-green gown Mr Crossby's manner was debonair and reassuring. 'No apology is needed. It wasn't in the least the gillies' blame. I wanted some exercise, and I had my fun with them. One of the young ones has a very fair turn of speed. But I oughtn't to have done it—I quite see that—with everybody here on edge about this John Macnab. Have I your permission to go?'

'Indeed you have. Mr Bandicott asked me to apologise most humbly. You're quite free unless—unless you'd like to have supper before you go.'

Mr Crossby excused himself, and did not stay upon the order of his going. He knew nothing of the fate of his colleague, and hoped that he might pick up news from Benjie in the neighbourhood of the Wood of Larrimore.

The other garage stood retired in the lee of

a clump of pines—a rude, old-fashioned place, which generally housed the station lorry. Since Angus was not in sight, Agatha, in spite of some trepidation, took a second jail-delivery upon herself. She had trouble with the lock, and when the door opened she looked into a pit of darkness scarcely lightened by the outer glow of moonshine. She flashed the torch into the interior and saw, seated on a stack of petrol tins, the figure of the tramp.

Leithen, who had been wondering how he was to find a couch in that stony place, beheld the apparition with amazement. He guessed that it was one of the Miss Radens, for he knew that they were dining at Strathlarrig. As he stood sheepishly before her his wits suffered a dislocation which drove out of his head the remembrance of the part he had assumed.

'Mr Bandicott sent me to tell you that you can go away,' the girl said nervously.

'Thank you very much,' said Leithen in his ordinary voice.

Now in the scramble up the river bank, or in the rough handling of Angus, his garments had become disarranged, and his watch had swung out of his pocket. In adjusting it in the garage he had put it back in its normal place, so that the chain showed on Sime's ancient waistcoat. From it depended one of those squat little gold shields which are the badge of athletic prowess at a famous school. As he stood in the light of her torch Agatha noted this shield, and knew what it signified. Also, his tone when he spoke had startled her.

'Oh,' she cried, 'you were at Eton?'

Leithen was for a moment nonplussed. He thought of a dozen lies, and then decided on qualified truth. 'Yes,' he murmured shamefacedly. 'Long ago I was at Eton.'

The girl flushed with embarrassed sympathy. 'What—what brought you to this?' she murmured.

'Folly,' said Leithen, recovering himself. 'Drink and such-like. I have had a lot of bad luck, but I've myself to blame.'

'You're only a tramp now?' Angels might have envied the melting sadness of her voice.

'At present. Sometimes I get a job, but I can't hold it down.' Leithen was warming to his work, and his tones were a subtle study in dilapidated gentility.

'Can't anything be done?' Agatha asked, twining her pretty hands.

'Nothing,' was the dismal answer. 'I'm past helping. Let me go, please, and forget you ever saw me.'

'But can't papa . . . won't you tell me your name or where we can find you?'

'My present name is not my own. Forget about me, my dear young lady. The life isn't so bad . . . I'm as happy as I deserve to be. I want to be off, for I don't like to stumble upon gentlefolks.'

She stood aside to let him pass, noting the ruin of his clothes, his dirty unshaven face, the shameless old hat that he raised to her. Then, melancholy and reflective, she returned to Junius. She could not give away one of her own class, so when Junius asked her about the tramp, she only shrugged her white shoulders. 'I let him out myself. . . . A miserable creature. . . . I hope Angus wasn't too rough with him. He looked as if a puff of wind would blow him to pieces.'

Ten minutes later Leithen, having unobtrusively climbed the park wall and so escaped the attention of Mactavish at the lodge, was trotting at a remarkable pace for a tramp down the road to the Larrig bridge. Once on the Crask side he stopped to reconnoitre. Crossby called softly to him from the covert, and with Crossby was Benjie.

'I've gotten the saumon,' said the latter, 'and your rod and gaff too. Hae ye the bit ye howkit out o' the fush?'

Leithen produced his bloody handkerchief. 'Now for supper, Benjie my lad,' he cried. 'Come along, Crossby, and we'll drink the health of John Macnab in sound champagne.'

The journalist shook his head. 'I'm off to finish my story. The triumphant return of Harald Blacktooth is going to convulse these islands to-morrow.'

CHAPTER VIII.—SIR ARCHIE IS INSTRUCTED IN A CONDUCT OF LIFE.

EARLY next morning, when the great door of Strathlarrig House was opened and the maids had begun their work, Oliphant, the butler—a stately man who had been trained in a ducal household—crossed the hall to reconnoitre the outer world. There he found an under-housemaid nursing a package, which she averred she had found on the doorstep. It was some two feet long, swathed in brown paper, and attached to its string was a letter inscribed to Mr Junius Bandicott.

The parcel was clammy, and Oliphant handled it gingerly. He cut the cord, disentangled the letter, and revealed an oblong of green rushes bound with string. The wrapping must have been insecure, for something forthwith slipped from the rushes and flopped on the marble floor, revealing to Oliphant's disgusted eyes a small salmon, blue and stiff in death.

At that moment, Junius, always an early bird, came whistling downstairs. So completely was he convinced of the inviolability of the Strathlarrig waters that the spectacle caused him no foreboding. 'What are you flinging fish about for, Oliphant?' he asked cheerfully.

The butler presented him with the envelope. He opened it and extracted a dirty half-sheet of

notepaper, on which was printed in capitals, 'With the Compliments of John Macnab.'

Amazement, chagrin, amusement followed each other on Junius's open countenance. Then he picked up the fish and marched out of doors, shouting 'Angus' at the top of a notably powerful voice. The sound brought the scared face of Professor Babwater to his bedroom window.

Angus, who had been up since four, appeared from Lady Maisie's Pool, where he had been contemplating the waters. His vigil had not improved his appearance or his temper, for his eye was red and choleric, and his beard was wild as a mountain goat's. He cast one look at the salmon, surmised the truth, and held up imploring hands to heaven.

'John Macnab!' said Junius sternly. 'What have you got to say to that?'

Angus had nothing audible to say. He was handling the fish with feverish hands, and peering at its jaws, and presently under his fingers a segment fell out.

'That fush was cleekit,' observed Lennox, who had come up. 'It was never caught with a flee.'

'Ye're a leear,' Angus roared. 'Just tak' a look at the mouth of it. There's the mark of the huke, ye gomeril. The fush wass took wi' a rod and line.'

'You may reckon it was,' observed Junius. 'I trust John Macnab to abide by the rules of the game.'

Suddenly light seemed to break in on Angus's soul. He bellowed for Jimsie, who was placidly making his way towards the group at the door, lighting his pipe as he went.

'Look at that, James Mackenzie. Ay, look at it. Feast your een on it. You wass tellin' me there were otters in the Larrig, and I said there wass not. You wass tellin' me there wass an otter had a fush last night at the Lang Whang. There's your otter—and be damned to ye!'

Jimsie, slow of comprehension, rubbed his eyes. 'Where was you findin' the fush? Ay, it's the one I seen last night. That otter must be wrang in the heid.'

'It is not wrang in the heid. It's you that's wrang in the heid, James Mackenzie. The otter is a ver-ra clever man, and its name will be John Macnab.'

Slowly enlightenment dawned on Jimsie's mind. 'He wass the tramp,' he ingeminated. 'He wass the tramp.'

'And he's still lockit up,' Angus cried joyfully. 'Wait till I get my hands on him.' He was striding off for the garage, when a word from Junius held him back.

'You won't find him there. I gave orders last night to let him go. You know, Angus, you told me he was only a tramp that had been seen walking up the river.'

(Continued on page 244.)

DRUG SMUGGLING IN THE ORIENT.

By Major W. R. FORAN, F.R.G.S., F.R.A.I., &c.

I.

IT is fairly safe to assert, without much fear of contradiction, that nearly everybody is a smuggler at heart, if not in actual fact. Our innate free-trade instincts and love of liberty revolt against what most of us look upon as interference with our rights when we are called upon to declare and pay duty upon a box of cigars, a bottle of wine or spirits, or some article of finery beloved of the feminine heart. Smuggling, therefore, is rife in every part of the world; and there can be little doubt that it will be so as long as man-made laws restrict our importations into the country where we make our home or in which we may, perchance, desire to travel.

The whole world is taking a keen interest in the drug traffic at the present time, for it presents a problem—great or small, as the case may be—in almost every country. In European countries, perhaps, people are more inclined to be shocked by the successive ‘revelations’ in the Press; and, as a natural consequence of these exposures, the distributors of drugs are hard put to it to find new methods of deceiving the authorities.

As regards artfulness and ingenuity, however, the cleverest rogues in Europe could scarcely show greater resource than the ‘Dope traffickers’ in India and Burma. To the generality of people the smuggler is a bold and bad man, with fierce and heavily-bearded face; and he is popularly credited with being armed to the teeth with knives, pistols, and other lethal accoutrements. In reality, the smuggler—the Indian variety, at any rate—is nothing of the sort. To all outward appearance he is a respectable, well-to-do, and easy-going merchant; but he is a thorough-paced scoundrel for all that, and his ostensible business activities are merely a blind to his real and secret occupation.

A very good example of the truth of this statement came to my direct notice a year or two ago in Rangoon. I was seeking quaint curios to purchase as presents for friends in England and America, and chanced to hear of a newly-opened Chinese shop in the Indian Bazaar quarter of the city; here, so I was informed, could be seen a marvellous selection of Chinese and Tibetan goods. These rare treasures were being sold at ridiculously low prices, and were fast disappearing; so I was urged to make a visit to this Chinese merchant with the least possible delay. The news seemed almost too good to be true, but I sallied forth to investigate. On arrival at the Chinaman’s premises I was amazed at the remarkable range of the goods

offered for sale; and still more so at the price marked on each article exposed to view. I had never seen such a wonderful collection of silks, linen, lace, embroidery, ivory articles, and so forth; and it was with frank delight that I made the very most of this golden opportunity. As my eyes searched here and there in the gloom of the interior of the shop, I awoke to the fact that there was a steady stream of Chinese, Indian, and Burmese customers passing through the building, and that all seemed intent upon reaching the back premises. This set my thoughts wondering, for it was unusual to find such a brisk trade in any shop of the Bazaar. Yet, beyond this fact, there was nothing to arouse suspicion, except, perhaps, that the merchandise was priced absurdly low.

I secured a splendid collection of gifts that would please all my friends enormously, and then took my departure. It so happened that I was at a dinner-party that same evening, and my host was a senior officer of the Imperial Police. In the course of conversation during dinner, I told him of the wonderful luck that had chanced my way only that morning. It struck me as strange that he appeared to show little interest in my narrative; but I noticed a rather grim smile on his lips. When my tale was concluded, he asked abruptly for the address of this wonderful shop. Quite innocently I gave him the information. Nothing more was said. I should have dismissed the matter there and then, had it not been that on the following morning a fellow-guest at my hotel requested me to take him to this Chinaman’s shop. On our arrival there we found it closed and some police on guard. My further enquiries elicited the solution to the riddle. It seems that John Chinaman was neither more nor less than an opium smuggler from Shanghai. He had brought all his shop stock from China with him, and had set up in legitimate business as a blind to his illegitimate activities; and, so I was told, had made a most profitable visit to Rangoon, until the police discovered what he was doing. I consider myself very fortunate in having visited his place of business when I did; another day of delay and it would have been too late.

II.

In India and Burma the smugglers are greatly aided by the corruption of the subordinate native officials. The smuggler takes advantage of their financial difficulties in order to get them into his toils. Once they have been foolish enough to borrow money or accept a bribe from a smuggler, they become as wax in his clever hands. As a set-off to this, the excise depart-

ment and the police are greatly assisted by informers; for the profession of the informer in the Orient is not looked upon as a dishonourable one. However, despite the help of paid informers, a very great deal of drug smuggling goes on, and most of it escapes detection.

In the Government of Burma's Resolution on the Excise Administration Report for the years 1920-1921, which was published in June 1922, it is stated that the government have to report a decrease in issues of opium from the government-controlled opium shops amounting to nearly two tons, and that there was a consequent decrease in the revenue of Burma of about Rs. 375,000 (approximately £24,667). In Upper Burma, no Burman is permitted under any circumstances to possess opium. In Lower Burma, twenty years ago or thereabouts, a registration of Burmese opium-consumers was carried out. Consumers were invited to come forward for registration, and a certain number, who had responded to the government's invitation, were given registration certificates and were permitted to get their quantum from the government opium shops. The register was then closed, and since then only registered Burmans can obtain opium licitly. No new names were entered on the register subsequently.

Unfortunately, this registration scheme was a virtual failure. When government began registration of opium-consumers, the smugglers realised that their livelihood was seriously menaced. Accordingly, they spread a rumour far and wide throughout Burma that the government were registering Burmans, not for the drug to be given to them, but because the Burman opium-consumers were to be forced to pay enhanced taxes. The result of this was that the great majority of Burmese opium-consumers did *not* register their names. At the present time, for every registered Burman consumer there are at least ten unregistered. This, I am told on very good authority, is the lowest estimate. The correct one would be, most probably, considerably greater!

III.

One naturally asks, where is to be found the remedy for this state of affairs? Obviously it is by re-opening the registers. That being so, it is remarkable that the Government do not do this. But they do not seem to view the matter in this light, and it is rather difficult to fathom their present policy. It occurs to me that they might possibly urge one of two reasons against such an obvious solution; or possibly both. They will most probably insist that it is highly undesirable that the Burmans should take opium; and secondly, that the Burmans' opinion would be strong against it. Both are sound enough in their own way, the former more so than the latter. But there is a perfectly sane answer to both theories.

In the first place, re-registration would merely mean regularising what is at present irregular. It is freely admitted that there are many confirmed opium-consumers amongst the Burmans—probably they number several thousands. You cannot stop them getting opium, for smuggling must always go on, as it is so near to China, and the long Burma-Chinese-Siam border is most difficult—if not impossible—to police efficiently. That being the case, it seems much preferable to register opium consumers and so regulate their supply and consumption—a half-cure is always better than no cure at all. Wisdom would seem to dictate that the Government of Burma, not being able to stop opium consumption altogether, should let confirmed opium-smokers have their drug at a reasonable rate, and incidentally reap a substantial revenue for the province. It seems utter folly to force them to the smuggler, to whom they must pay huge prices for opium to compensate for the risks run in dealing with this drug. Such must be to their economic undoing, and must also fill the jails with these people, who are not criminals, merely because they are victims of a habit which it is almost impossible to cure.

As regards the second argument which may possibly be advanced against re-registration, it may be said that if the Burmans do not know that there are legions of their race who habitually take opium, then it is full time they did do so. If they do know it, then—presuming they have common-sense—they should not interfere with the Government's action in regulating the consumption. The General Council of Burmese Associations—commonly called, locally, the G.C.B.A.—have opposed Government in almost every measure since these Burmese embryo politicians first began to imitate the agitators from across the Bay of Bengal; but surely they would not strenuously oppose a governmental action which was so obviously for the good of their own race and country. They have shown themselves, times without number recently, as lacking in common-sense, and filled with uninformed and preposterous opinions; but I refuse to believe they would go to such lengths in the matter of just regulation of opium consumption. It seems almost incredible that Government should fear the immature opinions of the G.C.B.A.; but stranger things have happened in Burma.

IV.

It is well to examine the possible good results from universal registration in Burma of opium-consumers. It requires no very great imagination to realise that many material benefits must naturally be gained. The first thing that must happen will be the ruin of scores of opium smugglers, and the profession of smuggling must necessarily be reduced to a very great extent;

secondly, there will be no inducement for opium-consumers of races other than Burmans to try to obtain allowances of the drug which are greater than their actual personal needs, because there will be no really profitable market for the surplus; and thirdly, the G.C.B.A., and other allied associations for the reform of the Burmese and their country, will find a fair field of work before them in preventing recruits to the bad habit. The latter benefit, possibly, will not appeal to the Burmese political extremists and social welfare workers, pseudo or otherwise!

If only the Government of Burma had seized upon this remedy for existing evils some time ago, and applied it vigorously, there would have been no occasion for their statement that the revenue of Burma had lost roughly £24,667 in the years 1920-1921, and that issues of opium through their own shops to registered consumers had decreased by close upon two tons; these figures might, and probably would, have been on the credit side of their account.

Any Chinaman resident in Burma, who can prove that he is a genuine consumer of opium, is permitted to purchase as much as he can actually use from a Government opium shop. There is no restriction. This being so, one may be forgiven for thinking that no Chinese opium habitués buy the drug elsewhere; but, in actual fact, this is not the case. In any district of Burma, if investigation was made, it would be found that there is a large number of Chinamen who are confirmed opium smokers and eaters, but who are not in possession of consumption tickets. The reason for this strange anomaly is not difficult to discover. Almost every Excise Officer in Burma is *afraid* to take on to his lists any new consumers! If he does so, he renders himself open to suspicion as a bribe-taker. One Excise Officer, to my knowledge, incurred such a suspicion because he let it be known in his area that tickets would be given to every Chinaman who could prove that he was a genuine consumer of opium. He was taxed with taking bribes, but was able to clear himself of such an unjust suspicion, fortunately; he was, however, severely reprimanded for acting contrary to the policy of opium restriction. This policy of restriction is impossible to define; for there is no evidence of a serious effort to do more than attempt to throttle smuggling. Opium consumption is looked upon as a habit that it is impossible to eradicate entirely; and, therefore, Government maintains a nominal control of it, whilst not forgetting to make revenue.

Perhaps I am not far from the truth when I interpret the Government of Burma's pious assertion—that there was a huge deficit to be recorded for the years 1920-1921—as implying that opium consumption was greatly on the decline. But the suspicion is strong in my mind that the figures recorded in the Govern-

ment's annual reports are little short of worthless, because they do not show the actual state of things as regards opium in the province. I have solid reasons for believing that it is not declining, and it is not likely to do so whilst there are not adequate restrictions imposed. If the opium habit cannot be stopped and blotted out entirely—a contention which those with knowledge of the Orient will readily admit—the next best thing to entire prohibition is efficient control and supervision.

V.

It must be remembered that drug-taking in the Orient is almost second nature to the natives. I once asked a well-known Excise Officer in Burma whether opium-smoking was the dreadful thing it was generally thought to be. He answered me in both the affirmative and the negative. Excess in opium, he stated, is worse than in most things; but if he had to choose between opium and alcoholic excess, he would unhesitatingly insist that drunkenness was by far the worse evil. He summed up his opinion in the following words: 'Opium does not, and never can, degrade any man as drink does; and nobody makes a beast of himself with opium. It neither makes a nuisance of a man, nor does it lead to violence and murder, as excess in alcohol does invariably.' As the result of many years' observation of people addicted to both vices, I am inclined to believe that he is absolutely correct.

Morphia is another vice in the Orient, although it is nothing like so prominent as the opium habit. Morphia injection in Eastern countries is far more repulsive than opium-smoking. I have visited dens where both vices were largely indulged in, and it is impossible to compare the former with any other drug vice; I would merely observe, 'May God have mercy upon the votaries of morphia.' Cocaine is another drug with a big following in the Orient; and it is an unmixed vice. Cocaine has a far greater power over its votaries than either morphia or opium, for the after-distress is keener and the craving for more much stronger; a slave to cocaine is a slave indeed! The harm that it does, and the certainty with which it eventually kills its victims, are truly appalling. I have seen some really dreadful instances of confirmed cocaine-takers; and there is nothing that can be done to cure them of this terrible vice.

Indulgence in hemp-smoking in India is as common as betel-chewing and tobacco-smoking. I have seen hemp being smoked everywhere that my wandering footsteps have taken me in India, and also quite extensively in Burma and the Shan States. I have discussed this vice with many government officials, and have discovered a wide diversity of opinion as to whether it is merely an undesirable form of indulgence

without any permanently evil effects, or whether it is gravely harmful. Personally, I incline to the latter opinion; but I have no doubt at all that it can never be effectually stopped. Hemp-smoking is far too deeply ingrained as a habit amongst Indians to be ever successfully uprooted.

In conclusion, it seems apt to retail an old Persian allegory, on the effects of these various Eastern vices, that I came across during the course of my wide wanderings in the Orient. It so correctly illustrates my view of the comparative degree of harm derived from the various drugs in common use 'East of Suez,' that it could not be bettered. This ancient

allegory says: Three men arrived one night at the closed gates of a Persian city. One man suffered from the effects of excessive alcohol drinking, the second from the effects of opium eating, and the third had smoked hemp to excess. 'Let us break down the gates of the city,' shouted the alcoholic drinker, in a fury of drunken rage, 'for I can do it with my sword.' 'Nay,' sleepily protested the opium-eater, 'we can rest here outside the city in comfort. In the morning the gates will be opened, and then we can enter. There is no hurry necessary.' 'Why all this foolish talk?' whined the hemp-smoker. '*Let us all three creep through the key-hole!*'

CRASKIE.

PART II.

III.

THE Maitlands' 'machine' turned out of Brig o' Muir at the same time as Craskie's, but in the opposite direction. Maitland drove, sitting on the front seat with his younger daughter Nelly, Mrs Maitland and Peggy perched precariously behind. The Maitland vehicle boasted no india-rubber tires; its passengers were forced to shout if they would be heard above its rattle. Mrs Maitland and Peggy shouted at each other, secure in the knowledge that the occupants of the front seat could not hear a word.

Of Peggy Maitland, Lady Campbell of Tomnahoy once gave a famous description *à propos* of some war fête where she and her tenants had mingled their labours. 'All these girls are nice,' she had said, 'but Miss Maitland is *really* nice.' So she was. Her detractors said she was 'ill-less guidless;' her admirers (who were much more numerous) said she was the happy mean. She was neither pretty nor plain; neither witty nor dull; neither very well-read nor very ill; yet somehow she stood out. If there indeed exists that elusive thing called 'charm,' then she had it. Shy and reserved, soft but sweet spoken, sympathetically capable in nine things out of ten, she took all after the gentle, well-bred father who drove the trap, and little or nothing after the very lively mother who sat by her side and plied her with questions.

Mrs Maitland was out of a rougher mould than her husband—a kindly despot at home, a tartar out of it. She was very anxious to see her elder daughter Mrs Bonnar. Nothing but the fear of frightening Craskie off prevented her from following the lead of a celebrated mother in that county—seizing Craskie by his huge shoulders and pushing him up to her daughter with the frank announcement, 'Here's Peggy; awa' wi' her!'

'Has he spoken yet?' she inquired candidly.

Peggy's negative was drowned in the rattle of the trap. She was resigned to a drive of refined torture.

'What said he, then?' Counsel for the prosecution was not to be fobbed off.

'Oh, mother, how can I tell you? I don't remember. Nothing particular.' What did it matter, she reflected, what the man had actually said? He had talked as long as he decently could, and as fast. He had wanted to talk to *her* just about anything. He wanted *her* interest in his plums, *her* laughter for his story, *her* encouragement about the electric-light. What did the plums or the horseman's wife or the electric-light matter *per se* so long as they had been pretexts for keeping on talking to *her*?

Mrs Maitland made an unladylike noise that was very nearly a snort. 'Nothing particular!' She mimicked her daughter's soft speech with diabolical accuracy. 'An' him gabbin' there the best part o' a half-hour. It's what I've said to ye all along—ye'll have to give the man a help. He's one o' that kind that canna come to the bit wantin' a pull.'

'Mother, I couldn't possibly. What would he think of me?'

This time the snort was undisguised. 'Couldn't poss-ib-ly! I kenna what folk are comin' to. When yer father came courtin' me——'

Peggy sighed with relief; the story of her father's courtship was good to last them a couple of miles along the road. With luck, too, it would lead to its habitual sequel—the tale of the servant-girl at the farm and her backward lover. 'So I says to him, "If ye be gaun tae tak' 's, tell 's," I says, "an' if ye're no' gaun tae tak' 's, tell 's, and nae be haudin' 's fae anither."' Yes, that familiar friend would almost certainly follow—and then they would be nearly home.

Her mind wandered a little. By long acquaintance she was enabled to punctuate her mother's

narratives with the appropriate remarks without giving them any very strict attention. If only, she thought, her mother were not there, and she were spinning through this sombrely beautiful evening alone on the back seat of the trap, how much more delightful her reflections could be. The evening might then wrap her into its own luminous serenity, take her away to those rosy countries beyond the sunset. But not so long as Mrs Maitland, wholly unconscious of the feelings she was arousing, discoursed amiably on the methods of bringing prospective husbands to the scratch.

'If ye be gaun tae tak' 's, tell 's'—the story had run to its reiterated point. Peggy sighed. She strove very hard to be 'nice' (the county's word), to be genteel in that good sense of the word which much abuse has driven from mind. 'Nice' girls could not do such things; but, after all, was not the historic servant-girl lucky to be only a servant-girl, with no pretensions to 'niceness,' and a compensating freedom to speak her own mind in her own language? If she could possibly go to Craskie next market-day, and did actually say to him, 'If ye be gaun tae tak' 's, tell 's,' or some equivalent of that time-honoured formula, what would happen? What would Craskie say?

She sighed again. She knew quite well what Craskie would say; she knew what he would 'tell 's.' And she knew she would be honestly and unfeignedly delighted to hear it. In her case the 'anither' whom the servant-girl played so strongly did not exist, and she did not want one. She was very fond of Craskie, and admitted it to herself without reservation; she wanted to go and stay with him always. People laughed at him sometimes—more out of envy than anything else, but she knew better. Quite unknown to Craskie, she had stood and watched him that war-time morning when the Seafields marched through Brig o' Muir—and she had understood a deal.

But 'nice' girls could fire off no magnificent ultimatum; they must wait to be asked. And Craskie did not ask. That was where it cut; that was the tragedy of being Peggy Maitland and not a servant-girl. 'If ye be gaun tae tak' 's, tell 's . . .'

But the stories were over; her mother must be answered certainly, silenced if possible. 'If he speaks, mother, I'll say "Yes".'

'The county kens that,' said her mother brutally. 'But wha'll gar him speak? No' you!'

IV.

A quarter of a mile from his own gates Craskie yielded at last to the importunities of his impatient horse and went home through the deepening dusk at a spanking trot. He was filled with resolution; and his house, solid and imposing, lent him something of its own

dignity and strength. Yet it seemed to extend to him a welcome that was only partial; the house itself was all right, so far as it went, but it lacked inmates. Now, if Peggy Maitland had been coming along the passage to meet him . . . But, instead, it was Sarah Begg.

'Ye're back, Mr John.' Sarah's inevitable greeting. Every Tuesday for years past it had met him on his threshold, and with a sudden chill Craskie felt that so it must go on meeting him for the rest of time. There was something appalling about Sarah, something inevitable; met thus, she seemed an essential part of the house and of himself. To talk, even to think, of evicting her was almost blasphemy. That 'Mr John' went back to the days of his mother, and was in itself a reminder of her iron domination. In those days a great many people had called him 'Mr John'; now no one did it but Sarah. She seemed to revel in it. 'Craskie ye may be outside,' she seemed to say, 'but once here, you're Mr John, and *my* Mr John at that, and don't you try to forget it.'

He responded to her greeting with an absent 'Ay,' and wandered into his big dining-room, with its fine, solid furnishings and its execrable oil-paintings of his paternal and maternal forebears. To Craskie's mind they spoilt the room; but that was another blasphemy. Only once had he ventured to suggest to his mother that some of the worst of them were daubs, and he had at once been given to understand that such an idea was entirely on a par with his notions in regard to the right of Miss Hope and Mrs Abbot to live their own lives. They glared down at him to-night with what seemed to his fevered mind something like hate; it was as if they knew he plotted against them. 'Bring that tawpie here!' they seemed to threaten him. 'Jist ye *daur*!'

Sarah Begg was one of the few people who could translate all Craskie's 'Ay's'; she had realised at once that he was put out about something, and had effaced herself. Craskie poured himself out a stiff whisky from a cut-glass decanter that would have split the skull of a bullock, and drank it miserably. He knew that his evil hour was but postponed, and to his unspeakable rage and horror he felt his resolution evaporating with every minute that passed. Under the cold, forbidding stare of three generations of Bonnars, Cruickshanks, and Tullochs that fine glow of self-confidence died away. Above the mantel-piece his mother, in the early years of her marriage, looked down upon him with her habitual expression of serenity—the artist, a better craftsman than most of his fellows in this gallery, had not been able to escape the flint in her large, placid eye. Craskie looked at her moodily; he had thought he had a house, but he had erred. The house was not his; it was theirs—all these hard-featured people his mother had taught him to venerate—

and most of all was it that lady's above the mantel, with her chiselled handsomeness and her shut, determined mouth. It only wanted a picture of Sarah Begg to make it complete. They would not object to *her*; but poor Peggy—his mother would fall from her frame and crush her.

The 'girl' came in with a lamp, but he waved her away. In the dark, at least, he could not see these disapproving faces. He tried to turn the incident to advantage by fixing his mind on his great scheme of an electric installation, but the thing had gone to dust and ashes. What was the good of putting in electric-light in order to see more clearly this detestable gallery—to make his mother's eyes glitter as they used to do when she was angry? That was the only sign of wrath she ever gave. If only she had lost her temper, and raged and cursed like ordinary mortals; but she had always been far too terrible for that.

The invariable ritual of his home went forward. Presently the 'girl' came back again with the lamp in a manner that would not be frustrated; she laid the table and announced his supper. Craskie seated himself at his board with a groan. Supper was not supper; it was but the prelude to an interview with Sarah Begg. The unbroken habit of years laid down that after supper was cleared away Sarah would appear for an account of the day's doings, the news, local or distant, Craskie had collected at the market. His opportunity? No doubt; but could he take it? Craskie's soft heart hesitated over giving notice to the humblest member of his establishment; a few incompetents thrive on his farm because he could not bring himself to tell them to go. How on earth, then, could he exterminate Sarah, coming for her customary chat primed with hallowed platitudes and comments which time had developed into sacramental responses; how could he tell her that her régime was at an end? Oh for a touch of his mother's gifts! His mother never had to give notice to anybody; they saw her coming, read her face—and gave notice first.

He hacked savagely at the loaf, as if he were decapitating his bitterest enemy.

And as he ate and drank, the thin, small voice of Funk began to make itself heard. Was he not, after all, putting the cart before the horse? Surely the right order of things was to ask Peggy first and *then* deal with Sarah. Suppose Peggy refused, and meantime he had given Sarah notice, would he not, urged Funk plausibly, look a nice sort of fool? To these sophistries Craskie strove to turn a deaf ear, but he listened. Back into the old vicious circle he went, and round and round and round like an ox in an old-time mill.

Spin it out as he liked, supper came to a close. The table was cleared, the lamp shifted; he sat in his arm-chair with his mother looking

down at him. And into the room, massive and black beneath that white, right-angled face, swam, sailed, processed—anything except walked—Sarah.

'Well, Mr John, was't a good market?'

King's pawn to K 3! The game was begun. Craskie launched into an account of the market, while Sarah listened, ticking off with nods of her magnificent head the items of his tale. 'That was good; Blackhillock got nae mair than forty shillings.' Or, 'I thought ye wud hae done better than that.' She stood back in the double light of lamp and fire, her eyes fixed on the painted face of Craskie's mother. Looking up at them from his chair, Craskie detected a resemblance between the two faces that had hitherto escaped him. Natural enough, of course; they were a sort of distant second cousins. But *had* it hitherto escaped him? Or was Sarah getting more like his mother every day?

He shuddered; his recital petered out. Now was his moment; but Sarah forestalled him. 'I saw Langmuir in yon new car o' his the day. I'm thinkin' that another year we might do waur than get one for Craskie. He had a stirk in the back o't, an' it sat there fine.'

'Another year!' 'We might do waur!' Oh, God-sent opportunity. Why could he not simply say lightly, jocosely, 'Aha, Sarah, another year I'll have a different plan. Another year——' and so on. Why couldn't he? God knew; but he couldn't. He writhed in his chair and said, 'Ay!'

Sarah promptly took the bit in her white teeth and treated him to a brief lecture on cars, their uses to the agriculturist. Craskie listened gloomily. She came to an end, conscious, perhaps, that his attention was wandering. 'Come on, now,' said his resolution hopefully; 'out with it.' But Sarah had a last word yet. 'I'm rale sure, Mr John, that if yer dear mother had been here this day she wud hae said wi' me.'

Oh, undoubtedly! Oh, most certainly she would! Oh, emphatically yes! On that, as on other subjects. What demon had inspired Sarah to say such a thing? And, on the top of it, how on earth could he proceed? 'Ay,' he said moodily, 'I'll have to see about it.'

Sarah looked at him sharply. Certainly he was queer to-night. Yet, on his own showing, he had had a successful day of sales. Had he taken a dram too many? No, he would never do that; and, anyway, his symptoms were scarcely those of over-exhilaration. He was listless, acquiescent. She saw a chance, long schemed for, long awaited. 'I was ower the top attics this mornin', Mr John. Ye know it's what I always telt ye. There's a pair o' bonny rooms there ready for the makin'. Just a matter o' two three attic windows. It's a thing yer mother and I whiles talked over——'

She paused for encouragement. Craskie

grunted. He knew all about the attics. But there it was—his mother again, reaching out, pulling him by the sleeve.

'It was aye an idea of hers'—Craskie's thoughts were too busy to notice the altered, coaxing note in her voice—to turn these attics into a suite o' rooms and hand them ower to me. That wud give ye, ye see, anither spare room on the second floor. Of course, it's a thing we've aye had before our minds like, but I was jist a kin' o' fresh struck with it this mornin'. She gave him another keen glance. 'In a way, d'ye ken, Mr John, I well believe it wad be mair to the hoose than the electric.'

She stood beside him, her large white hands folded in front of her, caressing with her left thumb the heavy gold ring on the little finger of her right hand. She watched him very keenly. 'Of course, as I say, it's a' naethin' new, but I never liked to pit it till ye till I was a kin' o' settled like here. Of course, gin yer dear mother had been spared—. But it's three year an' mair noo sin' she was laid awa', and if I canna call mysel' settled noo, I'll never can do't ava. . . . I wad like fine t' get thae attics, Mr John.'

She stopped, breathing a little heavily, waiting clearly for encomium and confirmation.

Inside him, Craskie's soul tore its hair and danced in impotent fury. He was being trapped; in some intolerable way he was being trapped, and in some way he could not possibly avoid. It seemed as if the woman were inspired, the things she was saying. In the Lord's name, why should she choose this of all nights to trot out such a demand? *Was* she inspired? Craskie glanced swiftly at the calm profile and flinty eye above the mantel, and glanced as swiftly down again.

He must say something, anyway. But the thing he had to say—the thing he had meant to say—it was impossible to bring that in now. He assumed an air which he believed to be a blend of judicial cogitation and semi-jocular encouragement. 'Ay, ay, Sarah,' he said heavily; 'we'll see about that too. All in good time.' He felt he was being insufferably ungracious, and made a desperate effort. 'Maybe ye're right about the electric.'

Sarah looked at him, puzzled. This was not at all the reception she had anticipated. It was very unsatisfactory, indeed. There was something very queer about Mr John to-night. She felt as a chemist might feel if a very ordinary substance reacted in a wholly contradictory manner. 'Ye've no' had any bad news the day?'

Craskie roused himself desperately. At all costs her suspicions must not be provoked.

'Na, na,' he said hastily. 'Nothing, nothing; but I'm maybe a wee thingie tired wi' the long day, an' the rain, an' all.' He pulled himself together with an effort. Sixteen stone of Craskie, champion of many counties, tired out by an ordinary market Tuesday and a Scotch mist! What was he saying? 'I'll bear in mind about the attics, Sarah'—he struggled ponderously—but I'm just not feeling over-bright the night. We'll have another crack about them.'

Sarah looked at him kindly. She knew he was lying, and she meant that it should be her business during the next few days to find out exactly how and why. Meanwhile, diplomacy. 'It'll be the leever, maybe,' she said agreeably; 'what wi' this changeable weather, an' a'. Ye'd better awa' tae yer bed. Wad ye like a hot bottle? It's a fell comfortin' thing a hot bottle if ye're no' jist yersel'.'

And so, in a cloud of domestic minutiae, Craskie's epoch-making interview came to a close.

And yet not altogether, for as he sat in miserable dejection before his fire, Sarah suddenly reappeared. 'I forgot t' tell ye,' she said, 'what wi' one thing and anither. I had a letter frae ma cousin, Johnny Tulloch, the day biddin' me come up an' see him. I jalouse he's in trouble again, an' I was minded tae gang up the morn an' bide the night. But if ye're no' better in the mornin'—'

Craskie jumped at it. At any rate, it would get her out of the house for the best part of forty-eight hours, in which time his beaten resolution might raise its head once more. He almost warmed to her. After all, he had made no sort of rise to the fly she had cast; in fact, he had been in the last degree boorish and ungracious, and she had been magnanimous about it. She had fished for a compliment, and caught a serpent of a rebuff, which she had really ill deserved; and in these circumstances it is not easy to be pleasant. Soft-hearted Craskie saw the diplomacy and nothing more. 'Tits!' he said. 'I'll be fine in the mornin'. There's nothing ailin' me. Awa' you up tae Drumbucket. The lassie'll see to me.'

She thanked him and went, marking down his sudden heartiness as a fresh symptom to be followed up at leisure. Craskie sat on for a while by his fire, thinking of the people of the day—of Mrs Lockie and her ill-timed joke; of Maitland and his thrusting wife; of Peggy a great deal; of the lady in paint above the mantel a great deal more. Of that struggling mid-aged farmer Johnny Tulloch, or his colourless sister Meg, he thought not at all.

(Continued on page 254.)

RAND GOLD ROBBERS.

By W. ARDOUIN.

DURING the Anglo-Boer war, when the other side were in temporary occupation of the Johannesburg goldfields, a large quantity of gold in bars was removed from the mines, under the instructions of President Kruger. Whether these gold bars, which represented some hundreds of thousands of pounds, eventually found their way to another part of the world, either after or prior to the death of the President, will have to remain a matter of conjecture. But the unshakable conviction has long prevailed in many influential circles of the British and Boer population of the Rand, that this treasure found a burial-place somewhere south of the Limpopo River. Expeditions have from time to time been formed to exploit territory where Dame Rumour has circulated an attractive tale, lives have even been lost in the hunt for this hidden treasure, and money freely subscribed by enterprising speculators has 'gone west' with remarkable precision; and yet this elusive wealth will continue to have an attractive feature for those who delight in living in their own little worlds of imagination, maybe long after this generation has passed away.

More than twenty years have elapsed since the Anglo-Boer war, and nothing has ever come to light of these hidden riches, but who will be so ungallant as to deny to these numerous treasure-seekers any satisfaction which they may derive in associating themselves with the halo of romance attaching to the Rand goldfields, which as a farm in the early seventies could have been picked up for three figures?

In the early days of these fields fortunes were easily made and as easily lost, and these conditions, coupled with the semi-lawless state of the country at that time, attracted men of doubtful antecedents from all parts of the world. Heavy gambling, hectic speculation, and original, if not altogether praiseworthy, bids for fortune were then the order of the Rand's feverish days and nights.

At the present time the most approved scientific methods have been applied to extracting the gold from the reef, and the industry, in every phase of its multifarious activity, is an attractive and intensive one. Despite the fact, however, that attached to the South African Police are some of the finest detective brains to be found in any part of the world, allowances have to be made every year for a huge deficit in the output of gold, due to illicit possession of the metal, which is a criminal offence and punishable with a long term of imprisonment.

Notwithstanding the risk involved, illicit gold-dealing is very prevalent, many wealthy Indians being successful and evasive offenders

on a princely scale. The difficulty would appear to be in getting it out of the country, and instances will be cited of the methods which are adopted for this purpose.

A lump of gold about 9 inches by 5 inches by 4 inches has often been sent on an overseas journey inside a sack of mealie meal, potatoes, or oranges, or it has been discoloured to form part of some ponderous machinery which is being conveyed from one portion of the continent to another. Specially lined trunks have before now been found to contain a quantity of gold-dust and clippings of considerable value, sufficient, for instance, to pay the expenses of a voyage round the world once they have been converted into cash.

An instance can be recalled of a party of illicit dealers getting away with a quantity of gold bricks which had been stolen from a bank in broad daylight, practically under the noses of the officials. The gang knew that the C.I.D. would be promptly on their track, and that they would be watched day and night. Their movements were controlled by a conspirator with all the modern proclivities of a Raffles, coupled with the suavity and plausibility of the more pronounced type of continental adventurer. His ostensible object was to outwit the police, who had carefully laid their plans for many arrests. A heavy trunk had been left in the luggage-room of a Johannesburg railway station, and a receipt taken for it. It was conspicuously bulky and unusually heavy. The police had succeeded in tracking the parcel, and, unobserved, remained in wait for their quarry. One day two men called at the station for the luggage and fell into their hands, and the arrest of the remainder of the gang followed, with the exception of the ringleader. But all the police found in the trunk was *schlenter* (that is, counterfeit). The arch-conspirator had let his confederates down with a vengeance. A shooting affair, years afterwards, in London was believed to be the sequel of this conspiracy; in it a well-known American beauty of very doubtful antecedents figured prominently.

In 1917 the *Walmer Castle* left Cape Town for Plymouth. She carried about 5000 South African and New Zealand troops for the battle-fields of Flanders and France. She also carried one of the largest cargoes of bullion which had ever been sent from South Africa to this country.

Many of those on board who were lucky enough to return to their southern home will remember the scene at Sierra Leone, when millions of pounds' worth of bar-gold was off-loaded by means of vegetable baskets on to the

torpedo-boats that were awaiting the liner's arrival, with the object of taking the gold to Plymouth.

This course had been necessitated in consequence, so it was understood at the time, of the vessel's captain intercepting a wireless from the Cape asking for confirmation of the news that the *Walmer Castle* had been sunk. Upon receipt of this surprising communication the course of the liner was naturally deviated, and when eventually it did arrive at Sierra Leone torpedo and cruiser craft were anchored thereabouts to receive the bullion.

The transference of it had been proceeding the whole morning. A start had been made at daybreak, and the task had not been completed at noon. At the last moment there appeared to be a flaw in the totals. Something had gone wrong with the counting in that torrid tropical quarter. This intelligence had been kept most ingeniously from the troops and voyagers, and the alert brains of the *Union Castle* boat, from the captain to the boson's mate, were roused. One brick of gold alone would have been worth about £4000, and, according to the cross-check, one was missing. But long before any tangible conclusion had apparently been formed as to what had become of the missing bar, which had been packed, sealed, and checked, peremptory orders were received for the *Walmer Castle* to put to sea again *en route* for Plymouth. Arrived there, several detectives boarded the ship, and some arrests were made; but as nothing afterwards publicly transpired as to what had become of the missing bar, it was presumed that either a re-check had led to the discovery of a clerical error, or, in view of the Secret Service activities of the enemy at the time, no public disclosures were made.

Some years ago, in the mining district of Roodepoort, within a few miles of Johannesburg, an attempt was made to hold up one of the secretaries of the mines, who was in the process of taking gold to a Johannesburg bank. The action of the two men who were involved in this attempt was swift and complete, and they were supported by cool and daring nerves. They nearly succeeded in getting away with the mine's weekly output. A motor-car was in waiting at an adjacent spot to enable them to make off hastily with their spoils when the secretary, unexpectedly recovering from a blow which nearly stunned him, fired and killed one of his assailants. This man happened to be the driver of the car, and as the other could not pilot the wheel his arrest quickly followed.

Before the cyanide process for extracting gold had been invented, the ore was subjected to a mercurialised treatment only, and it is in connection with the amalgam plates which came into operation in the latter process, both before and after the invention referred to, that opportunities were

afforded for illicit gold to come easily into the possession of those who were engaged in this risky but profitable undertaking. Small portions of the slimes, scraped off at irregular intervals, would be less likely to be missed on a mine producing within a reasonable limit of its capacity. Moreover, it must be remembered that the shifts are working day and night, that the living-rooms are in close proximity to the mines, and that a modern city with all the attractions of a continental casino is within a short travelling-distance by tram or train, and that down in the bowels of the earth hundreds of thousands of pounds' worth of gold are excavated every week, a quantity of which may well find its way into the hands of the illicit dealers. In these circumstances, although the percentage of gold extracted from the plates may not be exceedingly high, it soon accumulates and becomes valuable, and is sought after by the criminal brains of two hemispheres, attracted by the dazzling riches of these fields.

It was rumoured some years ago—with what veracity remains obscure—that thousands of pounds' worth of bar-gold were being shipped to another part of the world as coal. This ruse had been adopted owing to the extraordinary vigilance being exercised by the police and by expert investigators appointed by the mine-owners in view of pilfering, which had been taking place on the Rand on a wholesale scale. But presumably, on one occasion at least, the well-organised scheme miscarried. The coal, instead of finding its way into the possession of one of the port agents, who was always on the *qui vive* with an alertness and business instinct worthy of a better cause, was delivered, in error, on board a *Union Castle* liner as coal for the bunkers, and duly found its way into one of the furnace heaps, as the molten metal is understood to have been discovered in the cinder heaps and ashes, which are discarded by the liner when a suitable opportunity presents itself. The feelings of the stokers can well be imagined, who, in addition to dropping beads of sweat in a tropical heat, had unintentionally been instrumental in 'firing' golden nuggets.

LIFE AND LOVE.

THIS is love, and life worth living—
Faith in friends, and grace in giving;
Power to see, in tears or laughter,
Happiness, and hope hereafter;
Power to hold, when even closes,
Memories of roads and roses;
Labour, that is all our worth;
Virtue, and a valiant mirth;
Love of winds and open spaces,
Flowers, and little children's faces;
Love of horses and of seas,
Streets, and civic sanctities;
Trust in God, and His forgiving—
Thus is love a life worth living!

H. G. BEDDINGTON.

Chambers's Journal

SEVENTH SERIES

AS TOLD BY THE SHIP'S SURGEON.

PART I.

ORIGINALLY of Norwegian ancestry, from a family belonging to the Orkney Islands—Scapa Flow way, where the German Fleet committed suicide—I was born in sunny India, 'Somewhere East of Suez,' as Kipling has put it. As to the year, what matters it? A man is but as old as he feels, and I have long since joined the Peter Pan brigade, which refuses to grow old.

Some of my messmates at sea have facetiously called me a Scotch Hindoo—to distinguish me from Antony Ferguson, late chief engineer of the s.s. *Olympic*, who, being born in Constantinople, was known as the Scotch Turk! Either combination would have been formidable enough if it came to striking a bargain—at least, so said our friends!

With one hundred more Anglo-Indian kiddies, coming 'home' to be reared, my first voyage from Calcutta to London lasted 150 days. Far from being in a hurry to leave, mother told me years after, we youngsters could hardly be dragged out of our beloved ship and playground. Times have changed, and so have folks. Fast liners make travellers impatient and peevish to 'get there' quickly. Before ever we leave the dock at Southampton I am asked, 'When do you think we shall reach New York?'

I was educated in three famous Scottish seats of learning—St Andrews, Dumfries, and Edinburgh. There I was carefully brought up on readin', 'ritin' and 'rithmetic, to which I might safely add porridge, punctuality, and piety.

My initial voyage must have filled me with a love of the sea, for, as a boy, I made for it whenever I could. One good licking I got was for planning to smuggle away on a sailing ship from Leith to the West Indies, where I dreamed, I suppose, of coming across some 'Treasure Island.' Another drubbing was for skipping school and going up with a student to the operating-room of a hospital. So fate probably intended that some day I was to become a ship's surgeon. This, however, was not until I had been assistant surgeon amongst the Durham miners, the Staffordshire pottery workers, the Devonshire farmers, and the poor in the slums of East London.

Then followed six years in big London Poor
No. 747.—VOL. XV.

Law hospitals; grand and valuable experience, but so full of worry that, after repeated attacks of bronchial catarrh, I was threatened with asthma. My medical friends urged me to give up the work and go to sea for six months. This I was not loath to do, and as my health improved so much, I never returned to land work.

In quest of health, and free to roam, the first voyages I made were to Canada, then to India, China, Japan, and home by Burma; then to New Zealand *via* the Cape of Good Hope, and home round Cape Horn to Teneriffe and London. As pleasure trips to different fascinating countries, spent in congenial society, these voyages have pleasant memories for me; as a money-making concern they were a failure. In those days the position of a ship's doctor was not of much account, and his meagre pay hardly kept him in clothes and pocket-money. Shipping companies—not to their credit, be it said—gave no encouragement to passengers to pay any fee at all, and travellers, on their part, took it for granted that his services were entirely free. Hence any money he ever got was in the nature of a 'gift.' This unsatisfactory system lasted far too long, and the result was that good doctors remained on a ship only for a voyage or two. By-and-by, with bigger ships, came better conditions of service, and since the War the pay on the large liners has at last reached the stage of being a living wage at least.

In early days the medical equipment on board was very poor, and I often wonder now how we managed to muddle through with what little we had at our command.

In a long voyage to Japan, I had nothing but a small medicine-chest and a handful of instruments, the rest being left to luck. The hospital (so called) was small and dingy, placed right aft over the propeller, where the vibration was terrible; altogether inadequate for the care of any case, especially a surgical one. If any fever case turned up, I had to improvise 'isolation' quarters as I could, being dependent mostly on the ingenuity of that handy man known as 'Chips,' the carpenter. How and why the Board of Trade allowed it all to go on so long I do not know; but the requirements were laid down by them, and no one else had any say in the matter. Even yet the official drug

MARCH 21, 1925.

list prescribed for ships is worked out on the old-fashioned scale, and, in many respects, is useless for modern requirements.

Although, on the long voyages, my duties were mainly those of social entertainer, there were odd moments when past surgical experience proved valuable. On one ship, an engineer got his hand caught in the machinery, and I had literally to cut him out of it, completing the amputation when we got him aloft. One of the bridge officers gave the anæsthetic, and very well too. One purser, still well known on the North Atlantic service, proved an excellent assistant at operations. Post-mortem examinations were his special delight, and he never missed seeing and helping at one. In the tropics we were hailed once by a passing sailing ship, whose skipper asked us to take one of his sailors whose leg had been badly smashed by a fall. Gangrene had set in, so I had to amputate below the knee. He progressed well, and we landed him in good shape at Cape Town, whence he was returned to Cardiff. I am still grateful to the owners of that sailing ship, who sent me a cheque for twenty-five guineas for services rendered. Likewise, I feel kindly disposed to the owners of a cargo boat whose bo'sun I rescued in a New Zealand port. Mad with drink, he had run amok and shut himself up in a small deck-house. Bursting open the door, we got him by playing water on him with the hose-pipe, to find his arm broken in two places. Summary justice this was, but useful and quite humane under the circumstances. The owners sent me ten guineas for this, with the comment that it was 'a good morning's work,' and that I had 'earned every penny of the fee.'

Talking of lunatics, I have had to handle many of them at sea, often enough under very trying conditions, especially if the patient happened to be a first-saloon passenger. I am talking now of really crazy people—not of the large number who behave very queerly at sea, and yet are allowed to roam about free. A deported lunatic was being sent by the American Government to England. One day he was exercising on deck in charge of an attendant, who was a huge Dane. All of a sudden the insane man broke away, took a short run and hopped over the side of the ship, and was never seen again. The Dane was excited, but knew that he ought to acquaint the officer on the bridge. So he scrambled up on the boat deck and made for the bridge, gesticulating and shouting wildly that there was a man overboard. The young officer on watch saw him coming, and, as he knew there were some deported lunatics on board, he thought the attendant was one of them, who had broken loose. He therefore took no chances, and promptly hit the Dane on the head with a thick telescope, felling him and causing a big scalp wound. I arrived on the scene a minute later, and was giving him

first-aid when the skipper appeared, and I had to explain what the whole scene meant!

Once, in the Red Sea, a Chinaman fell down from the skylight of the engine-room and fractured the vault of his skull. The operation of 'trephining'—that is, removing the part of the bone which was causing the pressure—was his only chance of life, and I was anxious to give him it. Hardy, the second engineer, placed all his tools at my disposal, and these I used after carefully boiling them. After I had put the patient under the anæsthetic, Bloxham, chief officer, kept it up. The operation was not difficult after all, and the pressure on the brain was removed. The three of us nursed him in turns, and as he was alive after five days, we had hopes of ultimate success. But when we got into a sou'-west monsoon the ship rolled heavily, and we lost our man after a day's persistent vomiting—which was very bad luck for all of us.

A Chinese crew are a queer lot to handle. When things are going right they work better than the proverbial nigger, and even when prostrated with heat will go back to the stokehold an hour after they regain their senses. When sick, they took their own herb concoctions, and would have none of my drugs. The Chinese bo'sun looked after them, and the first intimation I would get was when he came along and said, 'Mister Doctor, Number 20 died few minutes ago.' 'What did he die of, bo'sun?' said I. 'Oh, all the same heart disease,' was his answer. More than once I was terrified lest some worse disease, such as plague or cholera, might be the real cause. In times of danger the 'Chinks,' like Lascars, were liable to get panic-stricken. In a typhoon in the Formosa Channel the whole crew of ninety forsook us, and, in their terror, locked themselves up in the fo'c'sle. Three firemen, trying to escape from the stokehold, were shot down. Thanks to the efforts of fourteen white men, the ship got to port safely, but battered.

On the road from Rangoon to Chittagong and Calcutta, with five hundred coolies huddled together on the decks, smallpox broke out. I isolated six cases by turning some of the boats into hospitals. Fortunately, we had no more cases before they were all removed to quarantine.

The passing of quarantine with as little delay as possible is one of the chief medical items of any voyage. Papers, therefore, must be in order, and all fever cases, real and suspicious, ready to be shown immediately on arrival. Some officials are more strict than others, especially if they know that a port from which a ship sailed is infected with plague, cholera, typhus, or smallpox. Personally, I have had no bother with any of them. However, I found Japanese, Italian, and South American officials 'fussy'; they required delicate handling. Real trouble does arise when the ship's surgeon tries

to conceal any case or disputes the diagnosis of any suspicious case—which is foolish and unnecessary. Otherwise, he is likely to get a fair and square deal, in no port in the world more so than in New York, where, for many years, I have never had a hitch. In some of our British ports, the quarantine doctor never comes along unless sent for by the sanitary inspector, who makes the first visit: another of our quaint, casual ways of muddling through important matters! *A propos* of smallpox, when it does break out on a passenger ship it is wonderful how the anti-vaccinationists—who are so brave when there is no danger—are the first to tumble into line and beg to be vaccinated! Half-way over to Plymouth once we had a bad case on board, and at one continuous sitting I had to vaccinate nine hundred souls—which took me eighteen hours to do. There was no other doctor on board; but I got noble help from George Hackenschmidt, the famous Russian wrestler, whose defeat of Madrali, the Terrible Turk, at Olympia, created such a sensation at the time. George enjoyed the whole proceedings immensely, almost as much as he loved to sit by the piano while I played and sang Scots and Irish songs to him.

A burial at sea used to be an impressively sad ceremony. As a rule the captain took it; although I do not think he liked the job, before perhaps the whole ship's crew and passengers. One good old skipper of mine broke down completely on one occasion, and I had to finish it for him. Nowadays, on fast liners, the purser officiates, unless he can pass the duty on to an obliging surgeon. 8 P.M. or 8 A.M. is usually the hour selected, and the burial service from the Church of England Prayer-Book is read.

It may interest readers to know that few burials at sea ever do take place nowadays. No first or second saloon passenger is committed to the deep without the express permission of a relative or friend on board. Failing such permit, a Marconi message has to be sent to the next-of-kin ashore asking for instructions as to disposal of the body. This, of course, provided that the death is not due to some contagious disease; in which case the disposal is entirely at the discretion of the ship's commander. Years ago, on the s.s. *Oceanic*, just after leaving Queenstown, a first-saloon passenger shot himself. By Marconi and cable we got word back in twenty hours, all the way from California, that I was to embalm the body and bring it on to New York. This regulation arose from a big lawsuit, the judges upholding the relatives' claim that, with the Marconi available, the next-of-kin should have been notified before burial at sea. Further, be it known—since 1913 no Jewish third-class passenger may be buried at sea unless he or she died of a contagious disease. So that, nowadays, the

surgeon is undertaker as well, and a complete equipment is at hand for the operation, which, incidentally, takes four hours' steady work to complete. A member of the crew is, as a rule, buried at sea with full honours; but here again, any department on board can claim that, if safe, the body of a shipmate shall be placed in a casket and conveyed to the relatives on shore. Most of all this is, I fancy, a matter of sentiment. Personally, I make it no secret that, if I die at sea, I should much prefer that the Union Jack be pulled quietly off, in the stillness of night, and my body slipped into the deep, blue, clean watery grave; just as, on shore, I should wish to be cremated, and thus avoid the unspeakable horrors of decomposition in the soil. A dear old pal of mine, a ship's surgeon, was buried, according to his dying request, in his full working uniform, cap and gloves, all ready for the final grand inspection by the Commander of All Souls.

While on the subject of ceremonies at sea, I have some very interesting notes about church service on liners. Years ago, when I made my first voyages to New York, nearly every passenger attended Sunday morning service, and many of the crew as well. These were the days when ships were smaller, and every one was a member of a happy family. To-day, little cliques are formed, and the less one sees of the other the better. Year by year the attendance fell off as Sunday became more like Saturday. On the crack of War in 1914 the attendance of passengers had fallen to twenty per cent. During the War there were, of course, fewer passengers; but they all came regularly to Church—no doubt scared out of their wits lest the next hour should be their last.

Now note what happened when the Armistice was signed and the submarine danger ceased. From 1918 till the fall of 1923, my figures, carefully taken at the services over which I preside, show a drop to fourteen per cent. of all first-saloon passengers! I offer no comment—he who runs may read. The fact is, Sunday to-day on a big liner is more recognised in the breach than in the observance of old-time regulations, which, after all, were fairly wholesome. Passengers play deck games, and cards for money in public rooms. So far they have not started dancing in the ballroom on Sunday evening, but they are itching to do so, and there is a strong under-current in favour of jazzing round to relieve what they call 'the monotony.' Personally, I should hate to see the line of demarcation between a British ship and a cabaret wiped out altogether—it is thin enough already. Some—a little, I mean—of the dancing is modest and graceful; much of it is fearfully familiar, and as discordant as the accompanying music—if, indeed, such a name can be given to it. Not that I am a prude, for the surgeon and the purser see and hear so

much to shock them that an extra little jolt or two does not matter much. But there is a limit even to frivolity, and I fancy it has nearly been reached.

Is there more drunkenness to-day at sea than twenty years ago? 'Certainly not,' is my reply. It has decreased very materially. Some of our folks have an idea that, owing to the Prohibition laws in the United States, the average American,

as soon as he comes on board, proceeds to 'load up' with any kind of liquor he can get hold of. That is sheer nonsense. Time was when I expected to have six men a voyage to treat for alcoholic excess. On the s.s. *Majestic* I have had to stop only four men's liquor in fifty crossings—a marked improvement on the old averages.

(Continued on page 266.)

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER VIII.—continued.

'WE will catch him yet,' cried the vindictive head-keeper. 'Get you on your bicycle, Jimsie, and away after him. He'll be on the Muirtown Road. There's just the one road he can travel.'

'No, you don't,' said Junius. 'I don't want him here. He has beaten us fairly in a match of wits, and the thing's finished.'

'But it's no' possible,' Jimsie moaned. 'The skeeliest fisher could not take a saumon in the Lang Whang with a flee. . . . And I wasna away many meenutes. . . . And the tramp wass a poor shilpit body—not like a fisher or any kind of gentleman at all, at all. . . . And he hadna a rod. . . . The thing's no' possible.'

'Well, who else could it be?'

'I think it wass the Deevil.'

Jimsie, cross-examined, went over the details of his evening's experience.

'The journalist may have been in league with him—or he may not,' Junius reflected. 'Anyway, I'll tackle Mr Crossby. I want to find out what I can about this remarkable sportsman.'

'You will not find out anything at all, at all,' said Angus morosely. 'For I tell ye, sir, Jimsie is right in one thing—Macnab is not a man; he is the Deevil.'

'Then we needn't be ashamed of being beat by him. . . . Look here, you men. We've lost, but you've had an uncomfortable time these last twenty-four hours, and I'm going to give you what I promised you if we won out. I reckon the market price of salmon is not more than fifty cents a pound. Macnab has paid about thirty dollars a pound for this fish, so we've a fair margin on the deal.'

Mr Acheson Bandicott received the news with composure, if not with relief. Now he need no longer hold the correspondents at arm's length, but could summon them to his presence and enlarge on Harald Blacktooth. His father's equanimity cast whatever balm was needed upon Junius's wounded pride, and presently he saw nothing in the affair but comedy. His thoughts turned to Glenraden. It might be well for him to announce in person that the defences of Strathlarrig had failed.

On his way he called at the post-office, where Agatha had told him that Crossby was lodging. He wanted a word with the journalist, who clearly must have been *particeps criminis*, and as he could offer as bribe the first full tale of Harald Blacktooth (to be unfolded before the other correspondents arrived for luncheon), he hoped to acquire a story in return. But, according to the post-mistress, Mr Crossby had gone. He had sat up most of the night writing, and, without waiting for breakfast, had paid his bill, strapped on his ruck-sack, and departed on his bicycle.

Junius found the Raden family on the lawn, and with them Archie Roylance.

'Got up early to go over my speech for to-morrow,' the young man explained. 'I'm gettin' the dashed thing by heart—only way to avoid regrettable incidents. I started off down the hill repeatin' my eloquence, and before I knew I was at Glenraden gates, so I thought I'd come in and pass the time of day. . . . Jolly interestin' dinner last night, Bandicott. I liked your old professor. . . . Any news of John Macnab?'

'Plenty news. He has us beat to a frazzle. This morning there was a salmon on the doorstep presented with his compliments.'

The effect of this announcement was instant and stupendous. The colonel called upon his gods. 'Not killed fair? It's a stark impossibility, sir. You had the water guarded like the Bank of England.' Archie expressed like suspicions; Agatha was sad and sympathetic; Janet amazed, and covertly joyful.

'I reckon it was fair enough fishing,' Junius went on. 'I've been trying to figure out the thing, and this is what I make of it. Macnab was in league with one of those pressmen, who started out to trespass inside the park and drew off all the watchers in pursuit, including the man at the Lang Whang. He had them hunting him for about half-an-hour, and in that time Macnab killed his fish. . . . He must be a dandy at the game, too, to get a salmon in that dead water. . . . Jimsie—that's the man who was supposed to watch the Lang Whang—returned before he could get away with the

beast, so what does the fellow do but dig a chunk out of the fish and leave it on the bank, while he lures Jimsie to chase him? Jimsie saw the fish and put it down to an otter, and by-and-by caught the man up the road. There must have been an accomplice in hiding, for when Jimsie went back to pick up the salmon it had disappeared. The fellow, who looked like a hobo, was shut up in a garage, and after dinner we let him go, for we had nothing against him, and now he is rejoicing somewhere at our simplicity. . . . It was a mighty clever bit of work, and I'm not ashamed to be beaten by that class of artist. I hoped to get hold of the pressman and find out something, but the pressman seems to have leaked out of the landscape.'

'Was that tramp John Macnab?' Agatha asked in an agitated voice.

'None other. You let him out, Miss Agatha. What was he like? I can't get proper hold of Jimsie's talk.'

'Oh, I should have guessed,' the girl lamented. 'For, of course, I saw he was a gentleman. He was in horrible old clothes, but he had an Eton shield on his watch-chain. He seemed to be ashamed to remember it. He said he had come down in the world—through drink!'

Archie struggled hard with the emotions evoked by this description of an abstemious personage currently believed to be making an income of forty thousand pounds.

'Then we've both seen him,' Janet cried. 'Describe him, Agatha. Was he youngish and big, and fair-haired, and sunburnt? Had he blue eyes?'

'No-o. He wasn't like that. He was about papa's height, and rather slim, I think. He was very dirty, and hadn't shaved, but I should say he was sallow, and his eyes—well, they were certainly not blue.'

'Are you certain? You only saw him in the dark.'

'Yes, quite certain. I had a big torch, which lit up his whole figure. Now I come to think of it, he had a striking face; he looked like somebody very clever—a judge perhaps. That should have made me suspicious, but I was so shocked to see such a downfall that I didn't think about it.'

Janet looked wildly around her. 'Then there are two John Macnabs.'

'Angus thinks he is the Devil,' said Junius.

'It looks as if he was a syndicate,' said Archie, who felt that some remark was expected of him.

'Well, I'm not complaining,' said Junius. 'And now we're off the stage, and can watch the play from the boxes. I hope you won't be shocked, sir, but I wouldn't break my heart if John Macnab got the goods from Haripol.'

'By Gad, no!' cried the colonel. 'Pon my soul, if I could get into touch with the fellow

I'd offer to help him—though he'd probably be too much of a sportsman to let me. That young Claybody wants taking down a peg or two. He's the most insufferably assured young prig I ever met in my life.'

'He looked the kind of chap who might turn nasty,' Sir Archie observed.

'How do you mean?' Junius asked. 'Get busy with a gun—that sort of thing?'

'Lord, no! The Claybodies are not likely to start shootin'. But they're as rich as Jews, and they're capable of hirin' prize-fighters, or puttin' a live wire round the forest. Or I'll tell you what they might do—they might drive every beast on Haripol over the marches and keep 'em out for three days. It would wreck the ground for the season, but they wouldn't mind that—the old man can't get up the hills, and the young 'un don't want to.'

'Agatha, my dear,' said her father, 'we ought to return the Claybodies' call. Perhaps Mr Junius would drive us over there in his car this afternoon. For, of course, you'll stay to luncheon, Bandicott—and you, too, Roylance?'

Sir Archie stayed to luncheon; he also stayed to tea; and between these meals he went through a memorable experience. For, after the others had started for Haripol, Janet and he drifted aimlessly towards the Raden bridge, and then upward through the pinewoods on the road to Carnmore. The strong sun was tempered by the flickering shade of the trees, and as the road wound out of the crannies of the woods to the bare ridges, light wandering winds cooled the cheek, and, mingled with the fragrance of heather and the rooty smell of bogs, came a salty freshness from the sea. The wide landscape was as luminous as April—a bad presage for the weather, since the Haripol peaks, which in September should have been dim in a mulberry haze, stood out sharp like cameos. The two did not talk much—they were getting beyond the stage where formal conversation is felt to be necessary. Sir Archie limped along at a round pace, which was easily matched by the girl at his side. Both would instinctively halt now and then and survey the prospect without speaking, and both felt that these pregnant silences were bringing them very near to one another.

At last the track ran out in screes, and from a bald summit they were looking down on the first of the Carnmore corries. Janet seated herself on a mossy ledge of rock and looked back into the Raden glen, which from this altitude had the appearance of an enclosed garden. The meadows of the lower haugh lay green in the sun, the setting of pines by some freak of light was a dark and cloudy blue, and the little castle rose in the midst of the trees with a startling brightness like carven marble. The picture was as exquisite and strange as an illumination in a missal.

'Gad, what a place to live in!' Sir Archie exclaimed.

The girl, who had been gazing at the scene with her chin in her hands, turned on him eyes which were suddenly wistful and rather sad. As contrasted with her sister's, Janet's face had a fine hard finish which gave it a brilliancy like an eager boy's. But now a cloud-wrack had been drawn over the sun.

'We've lived there,' she said, 'since Harald Blacktooth—at least papa says so. But the end is very near now. We are the very last of the Radens. And that is as it should be, you know.'

'I'm hanged if I see that,' Sir Archie began, but the girl interrupted.

'Yes, it is as it should be. The old life of the Highlands is going, and people like ourselves must go with it. There's no reason why we should continue to exist. We've long ago lost our justification.'

'D'you mean to say that fellows like Clay-body have more right to be here?'

'Yes. I think they have, because they're fighters, and we're only survivals. They will disappear, too, unless they learn their lesson. . . . You see, for a thousand years we have been going on here, and other people like us, but we only endured because we were alive. We have the usual conventional motto on our coat of arms—*Pro Deo et Rege*—a Herald's College invention. But our Gaelic motto was very different—it was "Sons of Dogs, come and I will give you flesh." As long as we lived up to that we flourished, but as soon as we settled down and went to sleep and became *rentiers* we were bound to decay. . . . My cousins at Glенаicill were just the same. Their motto was "What I have I hold," and while they remembered it they were great people. But when they stopped holding they went out like a candle, and the last of them is now living at St Malo, and a Lancashire cotton king has the place. . . . When we had to fight hard for our possessions all the time, and give flesh to the sons of dogs who were our clan, we were strong men and women. There was a Raden with Robert Bruce—he fell with Douglas in the pilgrimage to the Holy Sepulchre—and a Raden died beside the king at Flodden—and Radens were in everything that happened in the old days in Scotland and France. But civilisation killed them—they couldn't adapt themselves to it. Somehow the fire went out of the blood, and they became vegetables. Their only claim was the right of property, which is no right at all.'

'That's what the Bolsheviks say,' said the puzzled Sir Archie.

'Then I'm a Bolshevik. Nobody in the world to-day has a right to anything which he can't justify. That's not politics, it's the way Nature works. Whatever you've got—rank or power,

or fame or money—you've got to justify it and keep on justifying it, or go under. No law on earth can buttress up a thing which Nature means to decay.'

'D'you know that sounds to me pretty steep doctrine?'

'No, it isn't. It isn't doctrine, and it isn't politics; it's common-sense. I don't mean that we want some silly government redistributing everybody's property. I mean that people should realise that whatever they've got they hold under a perpetual challenge, and that they're bound to meet that challenge. Then we'll have living creatures instead of mummies.'

Sir Archie stroked his chin thoughtfully. 'I daresay there's a lot in that. But what would Colonel Raden say to it?'

'He would say I was a bandit. And yet he would probably agree with me in the end. Agatha wouldn't, of course. She adores decay—sad old memories and lost causes, and all the rest of it. She's a sentimentalist, and she'll marry Junius and go to America where everybody is sentimental, and be the sweetest thing in the Western hemisphere, and live happy ever after. I'm quite different. I believe I'm kind, but I'm certainly hard-hearted. I suppose it's Harald Blacktooth coming out.'

Janet had got off her perch, and was standing a yard from Sir Archie, her hat in her hand and the light wind ruffling her hair. The young man, who had no skill in analysing his feelings, felt obscurely that she fitted most exquisitely into the picture of rock, and wood, and water; that she was in very truth a part of this clear elemental world of the hill-tops.

'What about yourself?' she asked. 'In the words of Mr Bandicott, are you going to make good?'

She asked the question with such an air of frank comradeship that Sir Archie was in no way embarrassed. Indeed, he was immensely delighted. 'I hope so,' he said. 'But I don't know. . . . I'm a bit of a slacker. There doesn't seem much worth doing since the War.'

'What nonsense! You find a thousand things worth doing, but they're not enough—and they're not big enough. Do you mean to say you want to hang up your hat at your age and go to sleep? You need to be challenged.'

'I expect I do,' he murmured.

'Well, I challenge you. You're fit and you're young, and you did extraordinarily well in the War, and you've hosts of friends, and—and—you're well off, aren't you?'

'Pretty fair. You see, I had a long minority, and—oh yes, I've far more money than I want.'

'There you are. I challenge you. You're bound to justify what you've got. I won't have you idling away your life till you end as the kind of lean, brown old gentleman in a

bowler hat that one sees at Newmarket. It's a very nice type, but it's not good enough for you, and I won't have it. You must not be a dilettante, pottering about with birds, and a little sport, and a little politics.'

Sir Archie had been preached at occasionally in his life, but never quite in this way. He was preposterously pleased, and also a little solemnised. 'I'm quite serious about politics.'

'I wonder,' said Janet, smiling. 'I don't mean scraping into Parliament, but real politics—putting the broken pieces together, you know. Papa and the rest of our class want to treat politics like another kind of property in which they have a vested interest. But it won't do—not in the world we live in to-day. If you're going to do any good you must feel the challenge and be ready to meet it. And then you must become yourself a challenger. You must be like John Macnab.'

Sir Archie stared.

'I don't mean that I want you to make poaching wagers like John. You can't live in a place and play those tricks with your neighbours. But I want you to follow what Mr Bandicott would call the "John Macnab proposition." It's so good for everybody concerned. Papa has never had so much fun out of his forest as in the days he was repelling invasion, and even Mr Junius found a new interest in the Larrig. . . . I'm all for property, if you can defend it, but there are too many fatted calves in the world.'

Sir Archie suddenly broke into loud laughter. 'Most people tell me I'm too mad to do much good in anything. But you say I'm not mad enough. Well, I'm all for challenging the fatted calves, but I don't fancy that's the road that leads to the Cabinet. More likely the jail, with a red flag firmly clenched in my manly hand.'

The girl laughed, too. 'Papa says that the

man who doesn't give a damn for anybody can do anything he likes in the world. Most people give many damns for all kinds of foolish things. Mr Claybody, for example—his smart friends, like Lord Lamancha and the Attorney-General—what is his name?—Leithen?—and his silly little position, and his father's new peerage. But you're not like that. I believe that all wisdom consists in caring immensely for the few right things and not caring a straw about the rest.'

Had any one hinted to Sir Archie that a young woman on a Scots mountain could lecture him gravely on his future and still remain a ravishing and adorable thing, he would have dismissed the suggestion with incredulity. At the back of his head he had that fear of women, as something mysterious and unintelligible, which came from a motherless and sisterless childhood, and a youth spent almost wholly in the company of men. He had immense compassion for a sex which seemed to him to have a hard patch to hoe in the world, and this pitifulness had always kept him from any conduct which might harm a woman. His numerous fancies had been light and transient, and his heart had been wholly unscathed. Fear that he might stumble into marriage had made him as shy as a woodcock—a fear not without grounds, for a friend had once proposed to write a book called *Lives of the Hunted*, with a chapter on Archie. Wherefore, his hour having come, he had cascaded into love with desperate completeness, and with the freshness of a mind unstaled by disillusionment. . . . All he knew was that a miraculous being had suddenly lit the world with a new radiance, and was now opening doors and inviting him to dazzling prospects. He felt at once marvellously confident, and desperately humble. Never had mistress a more docile pupil.

(Continued on page 265.)

JANE AUSTEN AND SCOTLAND.

By A. FRANCIS STEUART.

WHY was it that 'the Immortal Jane' was so fond of Scotland? (She confessed her reverence for Charles I. as 'he was a Stuart.') She was purely English herself, and (so far as we know) resident in the south of England for most of her life; yet it is difficult not to be struck with the numbers of Scottish names to be found in her novels. Taking them (leaving out just now her *Juvenilia*, so tardily published in June 1922) in their order, we find great differences. In *Sense and Sensibility* (originally written in a different form in June 1797, though not printed until 1811) there is no Scottish trace, unless 'my friend Elliot,' who is mentioned by the asinine Robert Ferrers, can be

considered as such—and Elliot is a name found not only on the Scottish Border but (as Eliot) in Devonshire also. In the next published book, *Pride and Prejudice*, one of our greatest classics, written in 1796-97, but not printed until 1813, we find no distinctively Scottish name; although, perhaps, that of the inimitable heroine, Elizabeth Bennet, might be so claimed or recognised. I fear the English will not give her up without a struggle, for after all there are English Bennets as well as Scottish ones. *Northanger Abbey*, written in 1798, and printed twenty years later, has only one Scottish name, that of the ladies Fraser, whereas *Mansfield Park* (printed in 1817) is full of

them. There we have the beautiful Miss Crawford and her all-conquering brother, niece and nephew of an admiral, who caused the heroine, Fanny Price, so many pangs; their sister, the kindly Mrs Grant, and their friends Miss Fraser and Lady Stornoway, who all have a part in this very English story; nor must we forget 'Mr Campbell'—the friend of William Pryce—who was 'a very well-behaved young man,' surgeon of the *Thrush* when she was anchored at Portsmouth.

Emma (printed in 1816) is free from all names save those of English origin; but *Persuasion* (not published till 1818), the last of these great novels, has as heroine the charming Anne Eliot (a name we have already commented on), her Scottish gardener, Mackenzie, and her distant and rather teasing cousin, Lady Dalrymple.

Among Jane Austen's characters, therefore, it is obvious that there are a good many who bear Scottish surnames, and when one thinks of this one cannot but wonder why. She was at Steventon or Bath, where the Scot was not then greatly *en évidence*, less so at Bath by far than the Irish fire-eater. One is forced to ask: was Jane Austen ever in Scotland? Once started, this idea grows when one peruses her *Juvenilia*.

The first of these, a burlesque—and excellent fun it is—called *Love and Freindship*, which appears to have been finished on 13th June 1790, shows a knowledge of Scotland which is surely more than could be given by a perusal of the book, *Gilpin's Tour to the Highlands*, mentioned in the text. The heroine, after a series of wonderful adventures, finds herself in Scotland staying with 'MacDonald.' Turned out of MacDonald Hall eventually for inducing his daughter to jilt 'Graham' and elope to the unnecessary Gretna Green with the penniless Captain M'Kenrie, she and her friend witness the deaths of their husbands in a carriage accident, and her friend's fainting on the damp sward leads to her dissolution and this admirable advice:

'My beloved Laura (said she to me a few hours before she died), take warning from my unhappy end and avoid the imprudent conduct which had occasioned it. . . . Beware of fainting fits. . . . My fate will teach you this. I die a martyr to my grief for the loss of Augustus. One fatal swoon has cost me my life. Beware of swoons, dear Laura . . . a frenzy fit is not one quarter so pernicious; it is an exercise to the body, and if not too violent is, I dare say, conducive to health in its consequences. Run mad as often as you chuse; but do not faint . . .'

The afflicted Laura then gets into a coach bound for Edinburgh, where she discovers all

her relations and friends; but it is the description of the coach's run which makes one wonder if the author had not an authority nearer first-hand than *Gilpin's Tour*. The narrative continues: 'My next enquiries were concerning Philippa and her Husband, the latter of whom, I learned, having spent all her fortune, had recourse for subsistence to the talent in which he had always most excelled, namely, Driving, and that having sold everything which belonged to them except their Coach, had converted it into a stage, and in order to be removed from any of his former Acquaintance, had driven it to Edinburgh, from whence he went to Sterling every other day. . . . It has only been to throw a little money into their Pockets (continued Augusta) that my Father has always travelled in their Coach to view the beauties of the Country since our arrival in Scotland—for it would certainly have been much more agreeable to us to visit the Highlands in a Post-chaise than merely to travel from Sterling to Edinburgh every other Day in a crowded and uncomfortable Stage.'

Laura ultimately settles in the North, 'in a romantic Village in the Highlands of Scotland.' Philippa paid 'the debt of nature,' but her husband 'still continues to drive the Stage-Coach from Edinburgh to Sterling.'

Although *Love and Freindship* shows considerable knowledge of Scotland, the next work in the *Juvenilia*, called *Lesley Castle*, and dated 1792, in a series of letters shows even more. In it we find that Jane Austen knew that there were two universities at Aberdeen—a rare piece of special information, which suggests that she may have been there. Then this description of the Misses Lesley (in one of their letters) shows, perhaps, a first-hand knowledge of Scottish society:

'While our father is fluttering about the streets of London, gay, dissipated, and Thoughtless at the age of 57, Matilda and I continue secluded from Mankind in our old and Mouldering Castle, which is situated two miles from Perth on a bold and projecting Rock, and commands an extensive view of the Town and its delightful Environs. But tho' retired from almost all the World (for we visit no one but the M'Leods, the M'Kenzies, the M'Phersons, the M'Cartneys, the M'Donalds, the M'Kinnons, the M'Lellans, the M'Kays, the Macbeths, and the Macduffs) we are neither dull nor unhappy.'

In short, one cannot help wondering whether, sometime before 1790, the author was not in Scotland on a tour or a visit. Perhaps this paper may stimulate more research into the meagre details of Jane Austen's life, and if it even produces some more fragments—hitherto neglected—from her accomplished pen, it will not have been written in vain.

'DOWN UNDER.'

By WILLIAM D. BEATTIE.

I

SHE was busy rubbing the key-like opener of a discarded sardine tin on a stone. 'She' was just a girl who had been gracing this old mud-ball for a period of nineteen years and two months, and she was fashioning a rough needle from the dud material of the opener.

The mango-tree under which she sat was liberally festooned with that potato-like fruit you can at times detect in a bottle of chutney; but the said fruit still lacked that beer-blossom hue it would eventually sport when ripe. The mango-tree occupied part of a Chinaman's garden, now derelict, and a few such trees were about the only evidence that it had ever existed. Certainly some white sticks stood by the edge of the creek—dead orange and custard-apple trees.

Five years before the beginning of this yarn, David Grayson, on the death of his wife, had thrown up his job as a gamekeeper in that county of lakes and fells, Westmorland, sold up his home, and with Dinah, his only chick, who had just left school, set out for Australia. Ever since he was a lad, he had cherished a hope that some day he would put a strangle-hold on that wanderlust which for years had lost him a lot of sleep o' nights. Of a highly superstitious nature, he attributed to the finger of Destiny many signs and portents revealed to him in his nightly wanderings through the coppices of his native county, and Australia was ever mixed up with his musings. The death of his wife and helpmeet had left him with less desire than ever to continue earning bread for himself and Dinah in surroundings every lane and hedgerow of which reminded him of a happy married life now gone for ever.

Five hard, lean years had followed, and now on the Palmer goldfield, he was trying his luck on a—as yet—thin streak from which he had obtained colours in the pan.

It had been a long and arduous journey for both of them from Mareeba. His belief was that somewhere in the rocky heart of the sub-tropical land he had chosen for his wanderings lay, as yet undiscovered, a quick fortune in the form of a rich strike of yellow gold.

Dinah, just fourteen when her father brought her out here, was thoroughly domesticated, and could cook and bake as well as any woman in Kirkby Lonsdale. Nevertheless, many evidences of a nature swayed by romance could hardly escape the eye of even a casual observer. For weeks before the eventful Saturday on which they left Liverpool, her dreams had been disturbed by vivid scenes, in which lions, tigers, bushrangers, and native bears figured largely—

in reality, the first three as dead as the dodo in Australia, and the native bear about as ferocious as a pink-eyed rabbit gorged with dandelion.

Five years 'humping her swag' had opened Dinah's eyes to many realities, albeit she still retained many evidences of that natural charm so innate, shall we say, in most girls reared among the rugged beauties of a Westmorland dale. She still cherished the little Bible presented to her by her Sunday-school teacher before leaving England, and as she now sat preparing to sew the edges of a few corn sacks together, to make a roof for the rough 'humpy' her father had constructed, it lay open on an empty kerosene tin beside her. Her bare arms were bronzed, but hardly proof against the onslaughts of those nippy little ants, the bane of bush life. Round her neck she wore a double row of crimson-bodied, black-tipped 'giddy giddies'—bush pearls—she had gathered and strung before they set into that marble hardness which now characterised them. Ofttimes as she lay in her blanket under the starry canopy, with the five stars of the Southern Cross low down in the sky, she recollected the old Westmorland legend anent the misfortunes that would surely follow and dog the footsteps of anyone foolish enough to wear pearls in bed:

Pearls on the pillow, the wearer will soon
Meet the same fate as the man in the moon—

and on one occasion when she failed to remove hers, the dismal croakings of a pair of mope hawks kept her awake half the night.

It was a beautiful though hot afternoon, for old Sol was keeping the thermometer steady at 95 degrees in the shade. Motionless in the creek—except at intervals when, with his long beak, he harpooned a fish—an ibis stood. A mob of lean cattle, tired of wandering in search of a few blades of grass in the blackened tracks of numerous bush-fires, pulled wearily at the spiky lower fronds of a pandanus-tree. The delicate fragrance of a blossoming cork-tree was a welcome change from the everlasting smell of eucalyptus. The sheen of the evergreen trees dotting the bush landscape, and suggesting a plentiful supply of water, was illusory. Tap roots must penetrate to a depth of forty or fifty feet before reaching the water-line, and in the numerous caves, common where limestone bluffs rear their jagged heads, solid roots like long sinuous snakes could be found a hundred feet in length. No rain had fallen for several months, and the dead spear-grass was like tinder. A carelessly thrown match meant disaster, quick and certain, from fire.

Presently, four dull explosions warned her

that her father had finished work, for he would not descend his mine into the fumes of fuse and gelignite again that day. In a quarter of an hour—his claim was a bare half-mile away—David Grayson would come into camp, perhaps hopeful, perhaps despairing, to partake of his humble supper. Dinah brewed the tea in the 'billy,' put a half-moon piece of damper on the improvised table, and salvaged the tin of 'Nestlé's' from its watery jacket. Stores were running short, but the pack camels would be up shortly, when they could be replenished. Her father 'cooeed' when he came in sight, and Dinah ran down to the creek to meet him. With hammer and shovel he pulverised a few pieces of quartz; then, with that peculiar jerky semi-circular motion of the pan essential to carry off the mullock, he proceeded to take a sample.

Dinah watched the interesting process keenly, and noted the changing expressions on her father's face. 'It'll run two ounces, lass,' he said, 'and the lode is five inches wide.'

That night she sang for her father after supper, and the kookaburras heartily joined in.

II.

Wafted on the gentle westerly breeze, the 'chug-chug' of an oil-engine could be faintly heard. Lately the Queensland Government had begun diamond-drilling, in the hope that some day they would be able to announce a rich find in that old and now practically abandoned gold-field tucked away in the heart of the Cape York peninsula. In former days 'Chinks' to the number of thirty thousand or more had furrowed the surface with varying success, and as the tin-scratchers say, 'Where there's some, there's a lot.'

The East Lancashire syndicate, in whose interests Dick Hargreaves was now 'fossicking' on the tableland between Herberton and Forsayth, could not have chosen a better man for the job. He had 'all his wits about him.' He was twenty-seven now, and this little jaunt to spy out the land was all to his liking. He saw the Barron Falls from a different standpoint than that of most people who went to Kuranda for that purpose. Niagara had been harnessed without losing much of its grandeur from a tourist's point of view, and here in North Queensland a whole country's development was being sacrificed in deference to the whims of certain people who, basing their objections on what they knew about municipal gas-works, mistakenly thought that a hydro-electric installation would probably be of the same form of architectural beauty.

The climate round about Innisfail might have been modelled on that of Manchester in the matter of humidity, and Dick foresaw that the few mills at present squeezing sticky juice out of sugar-cane would in the near future be

dwarfed by others, whose looms perhaps would be weaving the bags to put the sugar in. Thousands of acres 'out-back' between Cloncurry and Chillagoe were, in his opinion, eminently suitable for cotton cultivation—so fertile that a pocket-knife stuck in the ground at night would be found sprouting in the morning!—and his opinion was based on experience gained in both Egypt and Alabama. The route of the projected north-to-south line would now almost certainly cut this belt of country, and as he expressed it in the words of the old song, 'Everything in the garden is lovely.'

He had heard a deal of talk from time to time about the mysterious rites practised by the peninsula aborigines, and he made up his mind that a detailed report to his firm in the 'Cold Country' on cotton-growing possibilities could wait until he had gratified, if possible, an overwhelming desire to witness a real fire-waltzing, blood-christening corroboree. The natives were reported to be friendly, and ordinarily one didn't get many opportunities of shooting them. If he was discovered prying into secrets guarded with almost masonic stringency, things might be different.

That's how he came to be within a few inches of a ricocheting bullet from Dinah's .32 Winchester. She often went after kangaroos, wallaroos, 'possums, and such like vermin, and heredity had a good deal to do with the fact that she was such a good shot for a woman. After all, she couldn't be expected to know that this particular dum-dum would pass through the left ear of a big 'roo she aimed at and cannon off the trunk of a lordly ironbark. If the faintest idea that a horseman was anywhere in the vicinity had struck her, she wouldn't have 'loosed off.' As it was, they were both startled, and when Dick galloped forward and touched his 'Stetson,' Dinah was profuse with apologies.

To say that he was agreeably surprised to find what he then regarded as a pretty parcel of lost luggage out there in the bush doesn't require a paragraph to itself. He didn't fall in love with her straight away, as he should have done if the Great War hadn't made the modern young man averse to falling anywhere, but he got as far as the admiring stage when she invited him with true bush hospitality to have a bit of 'tucker.' He was both hungry and thirsty, for he had ridden at least thirty miles since leaving the last cattle-station, and he made sad inroads into a hot flap-jack she baked for him on the charcoal when they got back to her father's camp.

As they ate they talked quite rationally, without a semblance of shy looks or blushes. But destiny was at work, unsuspected by either of them, and when our ends are being shaped like that—well, if you've ever seen that famous film, *The Taxi-driver of Tahiti*, you'll understand.

During the course of the meal Dinah told Dick of her father's bit of luck, and he expressed a keen desire to have a look at the show. He took the gear off his nag, hobbled it, and let it go. Dinah knew every foot of the way to the little oblong shaft her father put so much faith in. They went leisurely, for Dick had decided to stay for the night in the vicinity of the Graysons' camp. Both had noted the dull boom of mining shots, shortly after starting out, but they little suspected the awful tragedy which awaited their discovery on arrival at the mine!

David Grayson had rammed home four full charges of soap-like 'fracture,' lit the fuses, and, as is usual, was losing no time in widening the distance between himself and the coming eruption, when Fate took things in hand. Another yard and he would have been out of the mine and danger. But, alas! crude mining-ladders cannot be depended upon. Snap went a rung, and backwards went a hapless victim into that spluttering hell!

They found him there, and Dinah bore the cross of her orphanhood with a fortitude born of a sure hope of resurrection, accepting her companion's kindly spoken words of comfort with a thankful heart that God in His mercy had sent her practical human helpfulness in her time of greatest need.

Next day Dick took a shovel, and while Dinah, between her tears, read passages from her Bible, he filled in the earth so laboriously excavated, only a few days before, by that now shattered remnant of humanity underneath.

III.

The rapidity with which events had occurred in the last few days had left one definite resolve in the mind of Dick. His chivalrous Lancashire nature rebelled at the idea of leaving this pathetic little slip of a woman, now bereft of her natural protector, exposed to the many dangers he felt she must inevitably encounter alone in such wild surroundings. Keen disappointment possessed him at the curtailment of his search for adventure, with its possible chance of exciting incidents, but somehow this newer development gave him a greater amount of compensatory satisfaction. Had it been possible for an outsider to observe the many little attentions bestowed upon Dinah at this period, 'putting two and two together' would have been an easy task.

With perfect frankness he told her of his intentions, but Dinah was game, and ridiculed the idea that any harm could come to her if left. The camel teams would be up soon with provisions, and she would then decide what to do. Nevertheless, that acquired *bonhomie* she was accustomed to adopt with stray prospectors generally was beginning to give way to a feeling of shyness and reserve in the presence of her

companion. She allowed him to mix the cream of tartar and soda when a damper had to be baked, and the filling of the water-bags he took upon himself. She was aware of his purpose in undertaking this unofficial expedition far north of the Mitchell River, and her fears for his safety were increased tenfold by the appearance, passing south, of numerous small parties of blacks. The number of half-roasted porcupines they carried convinced her, from former acquaintance with such unmistakable signs, that preparations for a 'Grand Corroboree' were afoot. This knowledge was perhaps the deciding factor in allowing herself to be persuaded at last to accompany Dick back to civilisation. They left the old camp a little before noon, taking with them only absolutely necessary things, and even then Dick's horse was obviously overloaded.

Dinah, being used to bush life, proved a better walker than Dick, and he was glad, after travelling some fifteen miles, when the position of the sun warned them that time for making camp had arrived. After a frugal meal—all meals are frugal in the bush—they sat chatting, till suddenly an ominous sound Dinah knew to be the beating of tom-toms brought their conversation to an abrupt termination.

These days any one looking for trouble has no need to hire an aeroplane, and as Dick, telling Dinah to stay where she was, rushed through the undergrowth in the direction from which the sound came, he was in the way of proving the dictum.

A lurid glow in the gathering dusk lit up the sky, indicating where the circus was situated; the red-hot stones were being prepared for the fire-waltzing, and the cullet for the rib-scarifying ceremony, to be performed on all successful candidates for what passes in aboriginal morality for matrimony, was being dumped at the feet of the chief initiator.

'There was a sound of revelry by night' right enough, and as Dick shinned up a convenient tree he didn't intend missing much of the 'goings on.' Two things he was unaware of—one was the playful habit these natives have of making untenable the surrounding trees by installing live tiger-snakes among the foliage, in case any 'Peeping Toms' might be away from Coventry; and the other that Dinah had disobeyed his strict injunctions about staying in camp, and was at the moment hiding round the base of the tree he occupied. Few white men have ever witnessed a 'Grand Corroboree' and lived to give an account of what they saw. Rattling skeletons have been discovered in the remote bush country, transfixed through the eye sockets with native spears to trees, at the foot of which five peculiar stepping-stones have been laid in zig-zag angles.

From the vantage-point where Dick was, the most remarkable circumstance to him was the lavish display of colour on everything and every-

body within the magic circle. German colonisation in the neighbouring island of New Guinea had resulted in an enormous increase in the export of synthetic dye stuffs to this part of the world, and certain chiefs of tribes were known to be waxing fat. A spirit of emulation in the matter of showy daub worship could easily be pandered to here, and the rest can be left to the imagination of those accustomed to the methods adopted by what modern commercialism regards as 'pushing young men.'

Dick observed with what meticulous care not a few of the foot-roasting brigade negotiated the hot stones, and thought what perfect demonstrators of that modern slogan 'Safety first' they would have made. A craving some people display to view forbidden things from a higher pedestal than their fellows proved Dick's undoing. He clutched at a branch above him, and a six-foot rattler obligingly did the hypodermic part of the business.

Dinah guessed the reason of his sudden appearance on his back at her feet, and on her examining his right wrist her worst fears were confirmed.

Enjoining haste but strict silence, she crept back to camp with him, and it may safely be chronicled here that had it not been for her knowledge of how to proceed in cases of snake-bite, Dick Hargreaves would have been called to his fathers that night. Tightly she bound the arm below the elbow with handkerchiefs; then, fishing out from the pack a 'bushman's friend' outfit, she scarified the wound, and as the blood ceased to flow, applied the antidote liberally. Arranging his sleeping-bag, she bade him lie down and keep as still as possible. It is surprising what a strong man will quietly undergo when it comes to a case of mothering.

Dinah fed and watered the horse, for it was not good policy to let him wander away in the bush that night; then, taking up a position by the side of her patient, she sat anxiously awaiting that gentle sleep to overtake him which would herald to her the joyful intelligence that all danger was past. Presently, deep and regular breathing made her aware that that desirable stage had been reached. Wrapping her blanket round her, she kept her lonely vigil—and who can say what channels her thoughts ran into at this time?—until far into the night, when she, too, fell into fitful slumber.

IV.

As the first long slanting rays of the sun, like myriad searchlights, appeared through the trees in the morning, Dinah awoke to find Dick, very much better, quietly watching her, his eyes betraying something more than a fulsome gratitude. In that moment she felt the awakening of a newer, more sacred, and tender passion, and her whole being thrilled under the influence of

that mysterious magnetic feeling, the sex arc of love.

After breakfast, in answer to her inquiry as to his fitness to travel, Dick declared himself well enough to start, and though their progress was retarded in the forenoon, they luckily struck a cattle-station, where he purchased a pack-horse and saddle. They now took turns at walking and riding, and in this way made long forced marches, eventually striking the coast near Townsville.

Sydney harbour at nine o'clock in the morning presents one of the most delightful kaleidoscopic views to be found anywhere in the two hemispheres. Immediately on passing the 'Heads' from the open sea the voyager becomes aware of a striking similarity to a Japanese picture. The wooded knolls gently sloping down to the water's edge on either side, the patches of red and white showing where charming bungalows peep out above the greenery, the numerous jetties from which ferry-boats, suggesting amphibious tram-cars, cross and recross to Circular Quay—all go to make up a picture lovely in the extreme.

Sydney with its harbour may be likened to a gigantic shallow bowl of roses, their green stems immersed in a central pool of crystal water, across which many-hued butterflies flit in the sunshine. The coasting steamer, from whose deck Dick and Dinah viewed it, had made an uneventful trip from Townsville; and now, as they made their way towards the gangway to go ashore, Dinah linked her arm in that of her companion. She felt no qualms of regret that she had yielded to his persuasive entreaties to return home to England in his company.

During the long trek overland from the Palmer to Townsville many incidents had occurred which strengthened the trust she placed in him. A vague kind of feeling that somehow she belonged to him, and that some day he would claim her as his own, was sweet—ah, sweet, indeed!

Need we dwell upon the degree of happiness which gave impulse to all Dick's actions at this time? His mission to Australia had been gloriously satisfactory. He came to investigate and report on the country as a cotton-growing centre, and had discovered a diamond in the process. To become the sole custodian of such a gem became a feverish obsession. His crown of happiness could not be complete without this pure crystal to adorn it. Unknown to Dinah, he had negotiated the sale of that far-away gold location for a sum of £5000, and a stipulation that the new owners would not disturb that hallowed spot so humbly indicated by a little cross. The purchase-price he put in her name in the bank, and a visit to a shipping-office resulted in two berths being secured on a liner bound for London. There yet remained one momentous item to be settled, and as they sat

together on the veranda of their hotel a few days before they were due to sail, Dick marshalled his forces before the citadel, and the citadel fell to his impassioned onslaught with an unconditional 'Yes.' Just another of those sweet surrenders in which the clash of arms precedes the one supreme moment of human ecstasy.

Ever since that historic occasion in the Garden of Eden, when woman first dabbled in the fruit business, the same sense of a sad lack in the feminine wardrobe has arisen immediately she decides to go into partnership with a man. And so it was in this case. Dick interpreted his companion's many wistful peeps, as they passed certain of Sydney's fashionable emporiums, to the same hunger trait, and diplomatically approached the subject by suggesting that she should replenish her somewhat depleted outfit by the addition of a few 'creations' in readiness for the voyage.

Many men exhibit an excellent taste on the rare occasions when they are permitted, in addition to the time-honoured but somewhat dubious pleasure of footing the bill, to decide what best suits the particular form of those most dear to them. Here Dick scored heavily. Dinah had certain misgivings as she saw the parcels accumulate, but when they reached the pay-desk, and Dick, handing her a new cheque-book, proceeded

to instruct her how to draw one of those convenient adjuncts to modern business, signed with her own name, she felt some little explanation was due to her.

It would hardly seem necessary under the circumstances to go into detail as to the relative positions they occupied that evening in the palm court, while he enlightened her as to the facts of the sale of her late father's claim. Suffice it to say that whispers, interspersed with suspicious sounds that are not recognised as orthodox language, were found to be quite sufficient as a means of conveying the information.

The little church in the Westmorland valley, where, on St Valentine's day, some weeks later, they were made man and wife, had never in the memory of the oldest inhabitant contained a more representative congregation of that fair county's inhabitants. A bonnier bride never nestled closer to a more handsome bridegroom, as they dodged the shower of confetti and rice thrown with such hearty goodwill as they emerged from the porch.

And now, in her luxurious home, as she occupies many a quiet moment sewing, Dinah's eyes take on a far-away expression, the little garment drops in her lap, and she again visualises a lonely grave in a far-away land, not far removed from a pathetic little 'humpy' that never had a roof on.

'HONEY.'

DURING many years' residence on the Benue, the great eastern affluent of the mighty river Niger, I encountered on several occasions in the course of my travels about the country, on foot and horseback, attacks by wild bees, which, though troublesome, and sometimes painful, were commonplace, and 'all in the day's work.' Only once, however, did I experience the particular brand of misadventure described below, and I never heard of any one else having done so.

In the flood season one travelled on the Benue by steam launches of various types and sizes, but in the dry season on low water only the lightest draught craft could pass above Ibi, and the usual type was a steel canoe, or a very light, flat-bottomed barge, some fifty feet in length, and drawing less than one foot of water, undecked, and roofed over, leaving space at each end for three or four punters with light poles. At low river this mode of progression is satisfactory, for the poling craft moves easily along in the shoal water round the great sandbanks. But on the occasion under notice I was travelling by 'poler' because no steamer was available, the rains had not long ended, and the river had not fallen sufficiently for poling work. The consequence was that paddles had often to be used instead of poles, and the upward-bound

craft frequently had to hug a bushy bank to avoid deep water and strong currents; in some cases actually hauling by hand and rope, slowly and with difficulty, round a point of rock, jungle, or high grass, to which, normally, on low river, it would not have been near.

The party consisted of two canoes: in one, myself (the only white), my three or four native servants, my stores and belongings, and the crew; in the other, the crew, half-a-dozen native passengers, and some stores. Slowly up the river we proceeded day by day, camping at night, as usual, at some suitable spot.

One forenoon, the other canoe being half a mile ahead and out of sight, we were hauling round a grassy point, when my head 'boy,' a youth named Issa (but generally called 'Yam-head'), who had been my *fidus Achates* for some years, suddenly yelled out, 'Honey! Honey live for come!' Interpreted, this meant, 'Bees are upon us!' Instantly I snatched a mosquito-net that, contrary to custom, by the merest chance in the world, was on the floor beside my chair, having been left out of my bedding-valise that morning to be mended, as mosquitoes had interfered with my last night's rest. Drawing this all over me and my wicker chair, I sat steady to await events, and before I had com-

pleted the manœuvre bees enveloped the barge, and pandemonium reigned. Whether we had disturbed the angry swarm, or whether the barge ahead (which never saw a bee) had done so, I never knew.

The crew, practically naked, dashed overboard into the water, and my boys, all but one, did the same. Some of them struggled ashore into the long grass, hoping to dodge the bees there, but to judge from their screams and shouts they were disappointed. The remainder, in the water, clung by one hand to the gunwale of the barge, raising their heads only to snatch a breath. The barge, uncontrolled, sheered off into the current, and drifted slowly down the river, here some half a mile wide, the bees in full command, with half-a-dozen wretches in the water hanging on and screaming 'blue murder,' as they received the bees' stings on the head and exposed arm.

The one occupant of the barge beside myself was my head boy, who, stripped to the waist, and in spite of all I could say to him, with a bath-towel fought the bees to keep them from settling on his master. Surprised by cries behind me, I turned carefully in my chair, to see my smallest boy, who had lately been to England with me, fling himself out of a small cupboard over the side into the water. Unknown to me, on the sudden invasion of the bees, he had shut himself in, but the invaders had found a crevice and turned him out. After some time, perhaps ten minutes, Yamhead could stand his agonies no longer, and, half-blinded by stings, he followed the others into the water.

As we drifted down the river to the accom-

paniment of the screams of the natives and the buzzing of the infuriated bees, with nothing in sight ashore or afloat, and I was wondering how long this could go on, and how many of my companions would fail to reappear, a sound behind me caused me to turn and see the cook under a small tarpaulin cover. He was blinded by stings, and had crept from the rear end of the barge to say that he had found another mosquito curtain of mine, and might he use it? The bees now began to thin off, and the barge, having drifted for perhaps half-an-hour, and travelled over a mile, grounded on a sandbank in mid-stream.

We now were able to take stock of damages, and collect survivors. The bees that my boy had brought down lay on the floor of the barge thick enough to be swept up with a broom. We found a small canoe on the sandbank, and sent it off to the main bank for the men who had got ashore. The final muster in the afternoon showed all present but my small boy, who had not been seen after going overboard. Poor little beggar, he could not swim, and he probably made a meal for the 'crops.' Every member of the party except the writer was badly hurt, two of them seeming so near collapse that I thought they would die in the night. The only treatment for them that I could devise was copious bathing in warm water and 'Condy's.'

After a night's rest, however, camping on the bank where we had grounded, we were able in the morning, with no one actually disabled, though with most of the party showing heads of curious sizes and shapes, to continue our journey up-river with no further signs of 'honey.'

C R A S K I E.

PART III.

V.

FORTY-EIGHT hours is an interval of time which, according to circumstance, may seem exactly long or alarmingly short. With Craskie, pottering round his place in a black fury of humiliation, time halted and galloped alternately. It halted when his resolution rose again within him, and it seemed that of all things he most desired to have Sarah's formidable figure before him for a second round; it galloped when he tried to formulate his phrases for that encounter, and realised that he had none. In such moments as these he heard Sarah's step on the path, and dithered with apprehension.

What ill-natured demon had inspired the woman that night? If she had known his plans, and had been levelling a counter-attack, she could hardly have been more adroit. And the bit of it was that he had missed the op-

portunity she had given him. He had more or less promised to consider her proposals in regard to those cursed attics; at any rate, he had not—as he should have done—scouted the whole scheme, with reasons. Having made so colossal a blunder, how on earth was he to redeem the position now? It had been bad before; now, as a result of that fatal interview, it was infinitely worse.

The second day wore on, and still no Sarah. Craskie found himself developing new symptoms. He was cross to the hands; he gave many and contradictory orders; he fidgeted. He developed a distemper entirely new to his comfortable vitality—'nerves'; and the farm knew it.

Late on the second afternoon, partly to fill in the time, and partly to seek seclusion where he could find no one to quarrel with, he climbed to the top of the house; and, in imitation of Sarah, went 'ower the top attics.' Despite himself, he became interested. Sarah was right;

there were certainly two good rooms here. The flooring was sound; the place only needed windows. Then suddenly his eye fell on something that brought his mother back to him more clearly than anything had done for months. It was a family heirloom—an immense flat, 'hairy' trunk. Craskie had rarely, if ever, seen the unlovely thing without his mother; for a moment, as his eyes fell on it, it was as if she appeared before him in the room. His resolution quailed again.

He sat down on the trunk miserably, and then his eye lit on something else. Close to his hand, proclaiming by their dustless condition that they had lain there but a few days, were a tape-measure and a stub of thick carpenter's pencil. Relics these, manifestly, of Sarah's late reconnaissance.

Craskie was suddenly infuriated. He made a closer inspection of the room; sure enough, on the sloping boards of the roof he came upon great scores and crosses made with the carpenter's pencil, jottings of measurements taken with the tape. For a frantic instant he was speechless.

'The auld——!' Craskie's epithet was more forcible than polite. 'She was pretty sure of herself'. Ay!'

Human nature is an odd thing, and reacts to unorthodox motives. It was natural and prudent, it was even competent and thoughtful, of Sarah to make these measurements before launching her proposals upon him; yet to Craskie it seemed nothing but the essence of impudence. It was sheer, concentrated Sarah Beggary! It crystallised all his feelings of fury of the past two days. It was unbearable. So sure she had been that she would get whatever she wanted, so complacently persuaded that she was 'settled.' The house was hers, was it, all ready to make and remake as she thought fit? Oho! was it, then? 'Settled' she had thought herself; Craskie would 'settle' her. Ay!

He stamped out of the attic, kicking the hairy trunk as he went, filled this time with a resolve that would not fail.

In the handsome dining-room the disapproving stare of his ancestors met him again, but this time they were powerless to affect him. 'Glower awa'!' said Craskie, relapsing, as was his habit in moments of stress, into the broader Doric—'glower awa'; ye'll nae glower there much longer. Doon the feck o' ye comes the morn!'

The amazed stare of the 'girl' bringing in his tea suggested to him that he was acting like a lunatic, but his elation would not let him be quiet. 'A grand day, Jeanie!' he said affably, and realised, from a belated glance at the window, that it was pouring rain.

'It is that,' stammered the terrified maiden, and fled.

Craskie was still at his tea when the scrunch

of wheels going round to the back announced the return of Sarah. He went out to meet her in the hall, hot for battle, delightedly conscious that he was not afraid of her in the least. There she was in her sombre black—large and square and formidable; yet he wasn't afraid of her. Not one bit!

But the decencies had to be observed. He wanted to shout out at her, 'Sarah, yer time's up. I'm going to marry Peggy Maitland.' That would have been grand. But there was Sarah, dripping wet from her long moorland drive, still in her bonnet and cloak, and there was that daft-like 'girl' peering apprehensively from the kitchen. No, the moment was not yet.

'Sic a night it's come on, Mr John.' Sarah was unruffled as ever.

'Ay!' Craskie feigned commonplace speech. 'Awa' up, and change yer things.' He struggled for a moment; yes, he could at least make a move; could at least fire off the first gun. He would tell her he had something special to say to her after supper. The words were trembling on his not over-ready lips when the diabolical woman thwarted him again.

'Ay, I'm fair drookit. I'll see ye after supper, if ye're no' busy. I've something special-like to say the night.'

Was there ever such a woman for taking the wind out of one's sails! *She* had something special-like to say, forsooth; what about *him*? But she was sailing away up the broad staircase, and Craskie was sure the 'girl' was watching him through the hinges of the kitchen door. He went back into the dining-room, and slammed the door behind him.

Confound the woman! But he was forewarned now; she would not get the first word again. He would watch it.

Yet he failed again; for when, after supper, she came into the room magnificently refreshed and resplendent, Craskie was still bogging over the words of his opening; while her whole face, walk, atmosphere, expressed a prepared gambit. He was unready; she was not only ready, but brimming, bursting, coached and rehearsed to the last trick of tone and accent. She got the first word again.

'Ye'll be wondering what it is I've to say t' ye. It's no' often that I've anything by-ordnar. But I have the night. . . . It's about thae attics.'

Craskie looked up, staggered. Had the woman no sense of decency? or, like many middle-aged spinsters, was she taking a craze about the things? He had to admit that the one was as improbable as the other. Then what next?

'The attics?' he repeated stupidly.

'Ay.' Sarah was quite evidently working out a prearranged scene. 'It's jist t' say that I'll no' be needin' them after a'. Little I thocht t' say that when I drove awa' frae this hoose. . . . Ye'll laugh at me, Craskie—an' weel ye may—

but the plain fact o't is—I'm gaun t' marry Johnny Tulloch!

The staggering fact that, for the first time in recorded history, Sarah had called him 'Craskie,' instead of 'Mr John,' so clouded Craskie's perceptions that he was almost unable to take in the even more annihilating balance of her speech. His mouth fell open under the golden moustache; above his rosy cheeks his eyes bulged at her like those of a man half-drowned. Sarah surveyed him complacently. She had set her scene, and her dramatic talent had its reward. She had brought down her house.

'Ye're t' marry Johnny Tulloch!' Craskie spluttered at last. 'Godsake, Sarah, that's'—he pulled himself together hastily—'that's jist grand!'

'It's no' for the grandness o' t' that I'm daein' t', said Sarah, candidly, 'but jist a' things considered. I telt ye Johnny sent word for me t' come up. When I got tae Drumbucket what think ye I found? Nae mair an' nae less than that Meg Tulloch's ta'en the mind at long last t' wed wi' yon M'Pherson, as she micht weel hae done thae ten years syne. Weel, ye see, there's Johnny wi' naebody t' keep hoose for him—an' him a through-other body as ony atween here an' Spey, as ye ken.'

'Ay!' said Craskie, breathing deeply.

'Weel, the lang an' the short o't wis that things hae fallen oot atween him an' me as I've telt ye. We've been lang aquent, an' I ken Johnny's faults, an' he kens mine. I dinna say it's a' jist as I wad hae chosen, but we maun jist mak' the best o' what we're given, an' nae girn ower what we canna get.'

At ordinary times Craskie's ready humour would have risen to the appreciation of this very practical bride. But to-night he was flabbergasted. 'Jist that,' he said. 'Weel, Sarah——' and floundered again.

'So there's jist the ae thing left,' said Sarah, drawing herself together for her curtain. 'Ye'll jist need to set tae't an' seek a wife for yersel'. There's mony wad be ready, I dinna doot.'

The humour of it took Craskie at last. To Sarah's astonishment, he burst into a roar of laughter. 'We'll see aboot that!' he bellowed. 'Ay! . . . A-hay!'

VI.

Craskie, feeling somehow that the kind gods had dealt with him more leniently than he had any reason to expect, lost little time. It was Thursday evening that Sarah Begg returned from Drumbucket; on the following market Tuesday, Craskie enlivened Brig o' Muir by giving out his engagement to Miss Peggy Maitland.

Brig o' Muir received the intelligence in its accustomed fashion. Maitland père went about his business looking sleepier and dreamier than ever; his wife, true to the tradition of her caste, made herself needlessly absurd by assuring all

and sundry that never was she so surprised and astounded in all her life—and so on, with variations. Peggy received congratulations with a demure pleasure, but without any pretence that the event was either unexpected or remarkable. Craskie, a jovial giant once more, stood many drinks, and faced salvos of badinage, not always in the best of all possible tastes. Sarah Begg did not appear; but Johnny Tulloch was there—and not a little annoyed with Craskie for so completely overshadowing his own little sensation.

Craskie knew himself that grand thing, the successful lover, and he presumed that the world of his acquaintance viewed him as such. He would have been undeceived could he have heard all that was said.

Mrs Lockie, a weight off her mind—she had not ruined the lassie's chances after all—burst into the kitchen of the Gilzean Arms and confronted her husband with the magnificent news: 'Craskie an' the lassie Maitland! What did I tell ye?'

'Ye auld wife!' said Lockie rudely. 'Ye've gotten a nerve. What did ye tell me? What did I tell you? I telt ye the man was brawly off wi' Sarah Begg t' see till him, an' wad hae nae thocht o' marryin' so lang as she was willin' tae bide. Nae mair he wad. But once she cudna bide wi' him, then, naiturally, it was a different maitter.'

His wife was too disgusted to reply. But Lockie would have found congenial company in a corner of the bar, where sat two old men, scrubbily bearded and with mean faces. They were not among the recipients of Craskie's bounty.

'It's fell odd,' said Mr Toddock of Shores. 'Jist the verra thing I was sayin' t' ye last Tuesday. He wud, an' he wudna. He cudna mak' up's mind. And sae it was made up for him.'

Mr Skinner of Louby made an interrogative noise.

'Wha by?' Mr Toddock made play with his pipe for the sake of effect. 'Wha but Sarah Begg? (Dod, Sandy, but I wudna be in Johnny Tulloch's shoon the day! Yon's the wumman!) Ye can see fine hoo it a' fell oot. Sarah was wantin' tae get fixed up wi' Johnny, but, bein' a dacent-like wumman, she felt she cudna think o' hersel' till she'd made a bit arrangement for yon muckle gowk, Craskie. So she thocht o' the lassie Maitland—an' rale suitable too, as I winna deny—and she jist girded at Craskie till she garred him tak' the plunge. Ay, man, Sandy, that's hoo it was, an' nae doot aboot it ava.'

Mr Skinner shot a sour look towards the successful lover; his cleft palate emitted an incomprehensible but doubtless concurrent response.

THE END.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

ONE of Robert Browning's best-remembered lines is that embodying the spring-time yearning: 'Oh, to be in England now that April's there!' He is abroad at the time when thus he sighs, and sighs, as I know by the experience of many Aprils, from the depth of his soul. Separate yourself from England on some holiday-mongering business in February or March, and it is another affair; but if for months, or a year, you have worked and striven, however finely to your spiritual and human good, in distant places, where there is not only a foreign race to mix with, but another class of civilisation, you know the aching that gnaws at the soul when April comes, and a ship going back to England looks into your foreign port. Browning knew that April, with the homeland greening in the quickened life of spring, the germinal, is the month for these aches abroad. Yet, since his time, much of life has changed. April for the many was then, perhaps, more fully laden with hope and inspiration; maybe the calendar was not marked at this stage with any sinister or doubtful note. The poet had for ever done with April, its showers and sunshine, its promise and encouragement, ere the famous Victorian nineties came in. He had been long asleep in the Poets' Corner at Westminster when the Boer War was waged, and the income-tax then rose for the first time to be a prime factor in all considerations of domestic economy, rising further in the Greater War to the gloomy tyranny of a keen oppression. In our changed years any small boy of a middle-class household, keeping a keen ear at breakfast and other times to utterances indicating the family preoccupations, can tell you that April in England now is pre-eminently the month for budgets and taxation, and is regarded accordingly with apprehension. Exiles for a short season may yearn for England when April comes; but in recent years I have been in various foreign parts where colonies of our country's new poor have assembled, and the people there, reading the newspapers, have felt in April that for some reasons it was well that England no longer was their official and taxable home.

The big budgets of April in latter years have had a great effect in disappointing hopes and promoting sadder pessimism. The speech of the Chancellor of the Exchequer is now searched hungrily for abolitions and reductions; in Browning's day even a poet might have read the budget orations for the flowers of rhetoric contained therein, for once upon a time lofty speeches, imbued with noble feeling and refined with knowledge and culture, were made in the House of Commons on budget days. Ingenious manipulations of the intricacies of finance were performed. Figures in masses sound like harsh discords among the smooth phrasing of oration; but form and style were always features of the budgets of that time, and, levies being small, they could be read in the papers afterwards with a certain intellectual enjoyment. Disraeli once said: 'I have had many gratifying moments in my life, but the proudest of them all—the one that thrilled me with a sense of power and achievement—was when I rose to make my first budget speech.' Gladstone's budget expositions were great. Lord Morley in his biography remarks that one who had listened to all the financiers from Peel downwards said that Peel's statements were ingenious, but dry, that Disraeli was clever but out of his element, that Wood was like a cart without springs on a heavy road, and that Gladstone was the only man who could lead his hearers over the arid desert, and yet keep them cheerful and lively and interested without flagging. The people were intensely interested in his exposition of the public balance-sheet as an intellectual effort, and Gladstone himself revelled in the gigantic exercise. He said to Sir Henry Taylor, 'For nine or ten months of the year I am always willing to go out of office, but in the two or three that precede the budget I begin to feel an itch to have the handling of it. Last summer I should have been delighted to go out, now I am indifferent; in February, if I live as long, I shall, I have no doubt, be loath; but in April quite ready again. Such are my signs of the zodiac.' That was in 1864, and now one remembers that Gladstone's first budget, produced in 1853, was marked by a crisis in regard to the income-tax, which was then an interloper in national finance, hurting little but regarded

with dislike and suspicion. How sweet and pretty was the situation then, the veritable crisis, as we, licking our wounds—as we shall have to lick them for a long time yet—regard it across the span of seventy years! For the point of the crisis was whether the tax was to be endured and made permanent or abolished. It was, as Morley wrote, the keystone of the budget. Gladstone determined to renew it for a period of seven years—for two years at sevenpence in the pound, for two years more at sixpence, and for the last three at fivepence—and by that time he hoped that parliament would be able to dispense with it. In the concoction of this mighty scheme he spent thirteen, fourteen, fifteen hours a day. If he must go out to dinner he would stay up till four in the morning working on his scheme. Do statesmen now exert so much energy, such dynamic force, as some did in those times which we are too much inclined to regard as having been soft? When Gladstone was striving thus he still gave a Latin lesson every day to his second son. Having his budget ready, he went to Buckingham Palace to propound its principles to Prince Albert, and then forthwith addressed the Cabinet for three hours upon the subject! Yet a modern Chancellor might with some reason say that they did not know what budgets were in those days. Certainly the people did not imagine what taxation might be, or, being the good Christians they were, they would have prayed fervently throughout the month of April for their poor posterity. Some of the old budget traditions still remain. A Chancellor now wears the very robe that his father, Chancellor too, girt upon him on the budget day, but the time of budgets of the old classic style has gone. Chancellors still have a way of making old-fashioned jokes in a clumsy attempt, as it seems, to lighten a sordid and oppressive business, like one who would display his humour at a family funeral. They follow a lead given in this direction once by Sir Michael Hicks-Beach, who told the House that cocoa was his favourite beverage, and that he never touched tea or coffee except to tax them. But these speeches now are largely in the nature of lament, a dirge. They are not admired for their beauty of expression or thought. The fashion for classical quotation has disappeared; there has even been some wonderment lately when the Premier has ventured upon a slight revival.

* * *

Yet it may be doubted if the common people like ourselves are disturbed so much about the budget and taxation as once they were. Iron has entered into the soul of the taxpayer. He has become careless and indifferent to what were aforetime prime considerations with him, and he has cultivated

a new philosophy, the essence of which is a greatly diminished belief in the future. It follows that, in part at least, he abandons the principle of thrift, since it hangs upon the future, and holds small meaning without it. The common people are banking upon no distant future. The new philosophy has it that money is to spend and to spend quickly, and with a diminished care for the wisdom of the spending. He who saves, who tries to provide for that old proverbial 'rainy day,' is regarded as scarcely more intelligent than the petty old miser who starved himself, and for the greater security of his hoard kept it in coin in a stocking or some other convenient receptacle. And provision for the next generation, and so forth? It is impossible to envisage even dimly the conditions of life in the next generation. To provide for it according to the old habit, is it not to be likened to planning for a sojourn upon the moon by a party of persons contemplating travelling there by such firework methods as are announced by the Americans from time to time? Messages from Bechuanaland lately have informed us of the remarkable discovery of the skull of a man-like ape, who must have lived about five million years ago, and is considered, in quarters where the science of anthropology is studied and investigated, to have been something in the nature of 'the missing link.' Professor Dart says that he fills up the gap between the most primitive men and the most advanced apes; that this creature of Taungs was not of the human species, but yet a much more intelligent being than the gorilla or the chimpanzee; that he could not talk, but that his brain was advanced in the direction required in a creature whose descendants would attain ultimately the power of communicating with others by speech.

* * *

Now a certain provision for the future, which after all means thrift, is an instinct of human nature. The more conscious the living thing, the more intelligent and reasoned is the system and perhaps the extent of thrift. Some of the instincts and efforts of the creature of Taungs, emerging from the beast to the freedom and responsibility of man, must have been towards the future. Sir Arthur Keith, in his remarkable book on *The Antiquity of Man*, says in reference to such discoveries as that of the Piltdown man, that these ancient beings 'must have been deeply moved by a faith in things unseen and firmly convinced of a human existence untrammelled by the flesh.' Perhaps the creature was not old enough for the exercise of thrift, since one of the early calculations made from his teeth was that he was probably not more than six years of age. But *Australopithecus Africanus*, as he is about

to be named five million years after his time, must have had many wits about him, and was evidently much advanced upon the apes. He had a long bone down his nose, which is important when ranking him, and a forehead and chin approximating to those of a man. We may know later what his brain capacity was. Not equal to that of a human being certainly, but perhaps approaching it. A thousand cubic centimetres is reckoned to be the minimum brain volume to satisfy the needs of existence as carried on by human beings, while the biggest brain of the chimpanzee occupies 490 cubic centimetres, and of a gorilla 620. The ancient man of the Piltown fame, whose skull was found down in Sussex in 1912, had a brain capacity of about 1300 cubic centimetres, and he had quite evidently risen to the human stage long before and was engaged upon some effort towards civilisation. This and the famous Rhodesian skull and now the Taungs skull constitute three prime evidences so far—by odd accidents of discovery vouchsafed to us—of the evolution of man in his earliest stages, the Piltown, of course, being far later than the Taungs, this difference representing perhaps an evolutionary process of millions of years in itself. Man, with science, can force his discoveries and inventions at almost any rate he pleases now. We discover and invent more in a year, or even in a week, than could our grandfathers in a lifetime; but when it is a question of pure nature and the living processes, the rate of change, slow and sure, cannot be disturbed by us. The stability of man in this respect is one of the exasperations of human existence. We fine men of the twentieth century can do many things in a day, but it may take another five million years to change us ourselves to the extent we are changed from Master Taungs. But change we shall if life goes on, and fancy, based on tendency and circumstance, forces the suggestion that it will be in the direction of less body and more mind; that the being of the future, towards whom we are half-way from Taungs, will be some ethereal thing with powers beyond our modern conception, beyond what we might now attribute to the gods. Having discovered and invented so much since this young century began, what cannot be done by human kind in five million years, the rate of progress being not the slow and steady arithmetical—seeming like a stodgy system that assumes all things will last, and there is time for everything—but geometrical intensified, strengthening its acceleration as the human system becomes capable of bearing more and more progress, until, as it seems to us, a kind of delirium may be approached? Would it not have been as easy for the young creature of Taungs, near the dawn of intelligence, to imagine the state to which his infinite posterity might ascend in five million years, as for us now to think of what

man may be so much farther on in time from the present day? Many civilisations may have risen, crashed, and disappeared; even it may be that human life in this or an advanced form may have surrendered to circumstance, sunk to disappearance and oblivion, and started again in a new process of evolution, which might not, and probably would not, take the line of Taungs and ourselves. Remember that the world was old when Master Taungs was born, and, if we think in terms of eternity, only a little while has lapsed since then. Taungs indeed might be said to have belonged to us. And he had much of our form, and had begun to walk in an upright posture. We should avoid the habit of exaggerating the idea of time, and thinking of these five million years as representing a long period, when, considered from what we might call the point of view of creation, they are hardly to be distinguished from a day, or the time occupied by a journey on some of our railways. If human life, and perhaps the world with it, became extinct, and then life germinated all afresh, it would take another accidental direction from that to which progress by innumerable chances has led us, and what then? Poor, vague speculations, but not entirely useless since they may tend to better our sense of proportion, the quality in which we all most fail.

* * *

One of the poorest features of Victorianism, in spite of its accentuated pose and its ostensible goodness—because of them, one might say—was its smug assumption that its present was wonderful in completeness, material, and moral. Its horizon was limited, its sense or instinct of security and endurance extraordinary. It would have pledged itself to its estimate of the appearance and condition of things ninety-nine years ahead, and could have assumed a steady continuance towards nine hundred and ninety-nine. It was capable of conjecturing whether women would have reverted then to crinolines and men to Dundreary whiskers. It was in this atmosphere that the doctrine of thrift was intensely propagated, and in an impressive degree acted upon; and, it might be added, it was in such an atmosphere, not entirely healthy to the soul, that were reared such heroes of thrift as Samuel Smiles proceeded to immortalise to the best of his ability. But I think from what I know of the early northern manufacturers—and by circumstances it is much—they were far less objectionable in the virtuous pose than their biographer pretended. Now, a year ago, when careful citizens, recognising that times and manners had, with good excuse, much changed in the last decade, were yet becoming alarmed at the persistence of what seemed excessive spending, a great banker, one of the Barclays, came upon the scene with an arresting state-

ment that 'free spending will improve the profits of trade, and lead to the greater adventure of capital, and a proportional increase in employment.' Other financial folk of lesser fame fastened quickly to this idea, and not only criticised thrift, but condemned it; nay, indeed, they roundly cursed it. One felt, on reading their condemnation, that the true thing to do with the contents of your child's money-box was to extract them, and buy therewith something out of Bond Street, the child being thus corrected for its sin of thrift. 'Why,' said one, 'the only real curse to the country is the miser;' and, said another, 'It is "easy come, easy go," and that it is which makes a nation happy and prosperous. I would like to see a further spread of the spending fever in Britain, and then there would be an automatic solution to our unemployment problem.' This, again, is such exaggeration as to be dangerous if taken seriously; but, along with time and circumstance, it does serve to shake some old standards of thrift, which themselves were evidently bad in their warping effects upon the spirit. The new generation may like the counsel given by Henry Ford, the American motor manufacturer, who, they should remember, is hardly to be considered disinterested; and, apart from superb business attributes, embraces some strange whimsicalities, which must place our faith in him on a lower stage than the highest. We still recall how, with grandiose intentions, he came to Europe a few years ago, on what was called 'a peace ship,' with the pious intention of stopping the war himself, by special arrangement with those he met. But, alas! the soldiers kept on fighting. Henry Ford now says this: 'Until he is forty, a man should be gaining experience; he should be learning all he can, particularly how to spend money. That is why I told you that the best advice I could give to a young man anxious to succeed is: Spend your money—on yourself; get all the experience you can. Don't try to save money and be a miser.' If Mr Ford should at any time encounter a ghost fresh out from its grave, presenting an attitude of violent anger and offensiveness, he will know, without the asking, that it is the wraith of old Samuel Smiles, too much disturbed for further rest by these appalling dicta.

* * *

Governments have done little in recent years to restore the sense of thrift among the masses of the people. When one section lives on doles, and another is so much taxed that veritably it seems it must work hard for the means to pay its taxes, there is small place for thrift in thought or conduct. Perhaps governments cannot help themselves; it is hard to say. The whole idea of being and existence has changed as the result of the events of the last few years, and the new sense of the present is subtly strengthened by all

the anthropological and archæological discoveries and investigations that are made. A little thinking will suggest that the connection is much closer than might be assumed. One might almost say that the half-man of Taungs, who died so young, yet lived long enough to drive another nail into the coffin of thrift five million years afterwards; for, ask the spenders, the party of To-day, the Neo-Khayammmites, what shall it help to think of the next generation when it is so certain that the whole system of values, existence, and everything else will be changed, perhaps as the result of more wars, or even without them? To maintain a fortune now is to build on quicksands, they say. Five million years! What is the use of reckoning with time and existence? The actuaries can quote us average periods of life, but event and circumstance overcome them. Besides, the medical and other scientists are enormously keen upon the track of discoveries which they feel may greatly lengthen life, perhaps double or treble it, or very much more than that. How then about the next generation if the existing one continues with its mortal coil, and needs the means for its continuance and sustenance? The Neo-Khayammmites, believing only in To-day, and abandoning the old temples of thrift, have the worldly conviction that it is 'best to make sure,' for 'one never knows'—homely old platitudes containing mountains of cold, hard sense. That is why there are millions more of motor-cars on our roads than there were before the War, and why we may suspect the butcher's boy of an intended purchase, and why the traffic through London streets is so intense that there is talk of ripping up our parks for new and wider roads. The old idea was to save desperately in order to create a capital sum, the interest from which would maintain the saver for the rest of his days, and which would provide his descendants with a fortune, or part of one, according to their number, reducing their risks in life. This was the consummation of perfect thrift of the old standard, but, especially in its sheltering of the next generation, it does not seem on the moral or ethical side wholly without flaw, and no generation had a better right than this of ours to insist on its successors working hard and taking risks. And there is something doubtful about the economics. The new generation, in so far as it has any system or principle of its own, seems to lean more to the side of the annuity principle, reckoning up how much it possesses, and proceeding to spend capital and diminishing interest at such rate that, given a fairly long life, it will just last out. The difficulty, of course, in such a self-regulated scheme is to adjust the sums, allowances, and periods exactly; and indeed, the term of life not being known, it cannot be done, and the spender has before him always the horrible possibility of his being still alive when the last crumb of capital is spent, with the only and

doubtful consolation that he will be too old to care. But here, so subtly, comes in thrift again, murmuring, 'Prepare; you must prepare!' And in some form, and not exaggerated or dressed

up hypocritically, it is evident that in a world of moderate tranquillity and stability thrift must win. We should know in April now if it is to be given a better chance or not.

THE PRIMA DONNA.

By H. K. DERRY.

I.

BRISTOW first observed her as he sprawled in his deck-chair, pipe in mouth, hat tilted forward, gazing at the sea. She sat usually a few yards away, either knitting or staring also at the gently heaving water; and her eyes, unlike those of the other female passengers, never shot inquiringly sideways, so that he was able to regard her lengthily from under his shabby brim.

For a time it was a strictly impersonal regard, his eyes merely watching her flickering needles, while his mind revolved its own particular problems. He had never been introspective, and it teased him that he should have such problems at all. He dubbed himself peevish; blamed his liver and the cramped life on shipboard. But really he knew it went deeper than that.

Till a year ago, life had raced him along too fast for him to reflect how he disliked the pace. Existence had been a jangle of pianos and voices, the jangle thinning in proportion as he mounted the ladder of success. Now he was so near the top that the pianos had ceased to crash. He owned a soft-carpeted, sound-proof room at the Conservatoire; the right to say 'No' to any timid knocker without; the privilege of hearing a dozen grimacing girls perform vocal gymnastics, and afterwards of granting or denying them the right to a row of letters after their names. He strolled into concert halls; and next day, in the papers, commended or condemned the performer. His name figured on the cover of half-a-dozen songs. In fact, at the early age of thirty-five, he had 'arrived' in that exclusive set of artistic people that form the musical world. Then his health had failed. Sudden devastating weariness of the daily round took possession of him. He snapped at the full-bosomed, confident young women who sang to him; loathed his comfortable, song-strewn music-room; sickened at the sight of a concert hall.

'Nerves,' the doctor had said. 'Go to South Africa.'

'Nerves,' said his friends. 'In six months you'll be pining for the sound of a top C again.'

So he went to South Africa. His brother owned a farm and a piano, and for ten vivid months he drank in the sunshine and peace; then, with a pucker of discontent in his broad

forehead, he climbed on a steamer to come back again. But his friends had been wrong. His nerves had vanished, but the feeling about his pupils had not altered in his mind. On the farm he had composed some 'real' music. That was more valuable than the tuition of a crowd of ogling, self-satisfied women. Scarcely one of them could sing with an ounce of artistic perception.

A ball of wool rolled past his line of vision into the scuppers. He snatched at it, pulled out of his chair, and carried it to its owner. She extended a brown hand, and smiled. 'Thank you. I'm afraid I was dreaming, and didn't notice it fall.'

'It's a place to dream,' said Bristow; 'on a ship. Do you like the sea?'

She shook her head. 'Not much. I'm not dreaming about it. I've come from a farm; and I keep thinking of it, and what they're doing, and how the shadows lie on the hills.' Her voice sounded a trifle wistful.

'I've come from a farm, too,' said Bristow; and then, becoming suddenly conscious that he had nothing further to say, sauntered back to his chair. He was not accustomed to social communications with young women. He only knew how to say, 'Open your mouth'; 'Arpeggios, please'; and things of that sort.

II.

Yet, in a day or two, he had drifted into a quiet sort of friendship with Miss Garland. They would sit together, one knitting, the other reading, in companionable silence, occasionally looking up to gaze at the water and exchange reflections. Strangely, it was usually Bristow who began a conversation. He had always considered women chatterboxes, but Miss Garland was a colonial born, and the silence of great spaces seemed still around her. When she spoke, it was because she wished to express a thought, and though she possessed a whimsical gaiety, there was a fugitive air of sadness about her that puzzled him.

Her complete domesticity he found satisfying after the type of London girl he knew. He was sure that she had never heard of the 'Blues'; that the word 'shingle' merely reminded her of the seashore; that if he told her of his position at the Conservatoire it would convey nothing at all to her.

But though he did not tell her that, he told her a great many other things about himself; how he dreaded returning to the old, stifling life in London; how he seemed to have found his real self in the big African spaces; how he longed to purchase some land and settle there; but how, a Londoner born and bred, he feared the solitude of the life.

She looked straight at him, without embarrassment, and made the obvious suggestion, 'You could marry.'

He spread his hands hopelessly. 'Of course I could; if I could find someone of whom I shouldn't be heartily sick in a fortnight.'

She laughed at that. 'Why, in Africa it's hard enough for a man, but surely not in England. I thought there were so many women.'

He frowned at her. 'That's just it. There are so many that you can't get to know one! You can't speak to a girl without people coupling your names together, and her mother badgering you to come to the house. People pity the superfluous women; they never pity the *un*-superfluous man, watched and pounced on till his life is a perfect misery.'

To his surprise she pealed with laughter—laughter so clean and gay that presently his irritable look vanished, and he laughed with her. 'It's all very well for you,' he protested. 'You don't know what London is like—the crowds and the noise and the rain.'

She sobered, and the sparkle died in her eyes. 'No,' she said; 'but I soon shall.'

Bristow smiled whimsically as he pictured her in Piccadilly, with her tanned face and swinging skirts. 'You'll probably love it. Just for a spell it's good fun. Are you staying long?'

She was quite grave now. 'Yes. I expect so. I'm not going to have a good time at all. I shall have to work very hard. I am going to train—as a singer.'

She did not look at him, or she would have realised that his silence was one of stupefaction.

'My people are fearfully keen about it. I have always sung—ever since I was tiny, but I never thought anything of it. Last year they took me to Professor Vanheern, and he said I must come home and train, that I had a wonderful voice. I am going to the London Conservatoire; so I shall have the very best teachers.'

'Yes,' agreed Bristow, in absent-minded conceit; 'oh, of course!' He paused miserably; then burst out, 'Somehow I can't imagine you in that sort of world at all. I have always pictured you in—in the wide spaces. London—so sordid and noisy and sophisticated—you can't belong to it!'

As she looked at his rebellious expression a faint flush stole over her face. 'I always

thought so, too,' she admitted; 'but, you see, father is so keen. And, after all, the life of a singer needn't be sordid. It's a glorious profession.'

The sound of the dinner-bugle saved Bristow from making reply. Abruptly he gathered up her rug and cushions, and followed her in silence along the deck.

III.

That night as he lay in his berth the tumult of his thoughts drowned the snores of the man above him. He had had no idea, till he received that shock before dinner, how fond he had grown of the Garland girl. Now that his castle of dreams had collapsed, he realised that days ago, subconsciously, he had decided to ask her, eventually, to marry him. He had been making delicious pictures of a little bungalow in the wilds, with a grand-piano and a grave-eyed girl as companions in the solitude. Whereas, really, in a few weeks' time she would be standing by his piano in his familiar room, singing to him. And in a few months she would be on a platform before crowds. The thrill of it, after her lonely life, would intoxicate her. He would sit at concerts, and review her performance in the *World* next day. Miss Elizabeth Garland! What a name for a prima-donna!

It was strange how he never doubted her possession of a wonderful voice. Bristow, the critic, who was accustomed to smile cynically at the eulogies of singing-masters, forever sending him pupils with the written belief that they had 'extraordinary' voices! But Miss Garland was so genuine. She had told him so impersonally, as if it were something quite apart from her individuality. She had not seemed in the least elated about it; that fugitive look of wistfulness had looked from her eyes while she told him. Possibly she was wondering if Professor Vanheern had been right in his prognostications of amazing success.

He wondered, tossing uneasily about in his cramped quarters, whether he could bring himself to undertake her training. It would be purgatory to leave her to any other master; but it would be purgatory too to watch the effect of her new life working its change in her; to see her growing 'smart' and modern, shedding by degrees that clean, frank look that reminded him always of the fresh wind off the mountains. No, he couldn't bear that. He was glad he had never told her where his work really lay.

IV.

The next morning, as they passed the music-room together, he paused with his hand on the door. 'You might sing to me sometime,' he said.

She peeped inside. 'There's nobody there

now. I'll fetch my music. It'll keep me in practice;' and she ran down to her cabin.

When she returned Bristow took the songs from her. 'What have you got? Shall I play for you?'

She looked up in surprise. 'Do you play? It's very good of you, but I'm used to playing my own. I feel more at home.'

She sat at the piano, and Bristow dropped into a chair, half smiling. Evidently she had suffered from male accompanists. He visualised a young farmer, with great brown hands, pounding the keys. Then he settled himself to listen, and after a few opening bars she began to sing. It was a sentimental air, something about a rose and a girl, but he had not expected a classic.

She sang two songs before she turned to look at Bristow, her expression showing faint surprise that he had made no comment. He was sitting with his hand shading his face, but at the sound of the closing of the piano he looked up swiftly, and immediately she guessed why he had not spoken. His silence meant more to her than the compliments she was accustomed to receive, for her colour deepened as she picked up her music and walked to the door. She half-expected he would call her back and ask her to continue, but he merely rose awkwardly, and, murmuring 'Thank you,' held the door open for her to pass. He did not follow her, and she sauntered out on to the deck and settled herself in her chair.

v.

Half-an-hour had passed before, glancing up, she saw him coming towards her. His face was so white and set that she pulled forward his chair, and, as he dropped into it, asked concernedly, 'Is anything the matter?'

His muscles relaxed slightly, and his mouth twisted into a half-smile. 'Yes. I've had a shock—a shock that forced a difficult decision on me. But I've made my mind up now. It's something to do with you.'

'With me?'

He was fumbling in his waistcoat pocket, and finally produced a card-case. His fingers were a trifle unsteady. 'I believe I have never told you what my profession is; but I think you had better know now; it will give more weight to what I am going to say. I'm afraid I've got some bad news for you. Of course, it is only one man's opinion.'

She took from his extended hand one of his professional cards, and examined it with a pucker of mystification. Then she looked up at him. 'You're on the staff of the London Conservatoire?'

He nodded miserably, his eyes fixed on her face.

'Then, what——' The corners of her mouth lifted whimsically. 'Oh! Is it—that you

don't think I have such a wonderful voice, after all? I knew something had struck you in the music-room; but perhaps——'

Bristow clenched his long fingers. It was no good beating about the bush. She would hate him, of course, for being brutal, but it was kinder in the end. Far easier it would be to wait silently till she had received the blow from other lips in London, and then, at the height of her disappointment, to appear comfortingly with another suggestion. He had often told disagreeable truths before, but never, through his career, had it hurt him so much. He jerked his head and looked out over the sea.

'You've no sort of a voice at all. Nothing that would take you further than a drawing-room party. Your people and that Professor Whatsisname have made a tremendous mistake. Of course, I don't know what the standard is in the colonies, but in England a voice like yours doesn't count at all. It would scarcely take you into the chorus of a musical comedy. I've tested hundreds of women's voices. That's my candid opinion.'

His lips closed again. His eyes were riveted on a foam-flake far out on the waves. But his ears were strained to hear the first catch of her breath, or the short gasp that heralded a rush of tears. (Oh, he had made them cry before, on such an occasion, and scarcely even felt compassion!)

But she sat so still that at last he added, in a gentle tone, 'I'm frightfully sorry. I know it must be an awful blow. But I felt it wasn't fair to let you get to London without knowing the truth. It would have been much worse there.'

Then he turned to her, and suddenly, as he saw her face, the colour flooded into his own. 'You're smiling!' he stammered. 'Then—then, don't you——'

She broke into a laugh. 'Mind? Of course I don't! Oh, you thought you were breaking my dreams, but really you were letting me out of prison! Why, don't you remember how once you said you'd always pictured me in the wide spaces? You were right; I belong there, and always shall. I hated the idea of London. Only when my people were so keen, I tried to pretend I was pleased. Besides, if I really *had* had a marvellous voice—well, I suppose it would have been one's duty, in a way. Now I shall go to the Conservatoire and listen to another man saying what you have said; then I shall climb on a 'bus and drive round London, and then I shall get on a steamer and sail straight home again. Oh, I was miserable at leaving the Cape! I wonder how you never saw it.'

For a moment there was silence. When Bristow spoke again, his look had travelled to the horizon. 'I had been dreaming,' he said in a low voice, 'before you told me about your

voice, that one day I might have a home in South Africa—in the wide spaces—and that possibly we might manage to be very happy there together; with a grand-piano and a few cattle!’

His eyes left the horizon and travelled slowly to her face. ‘Was it an impossible, foolish dream of mine, do you think?’ He had to bend his head very near to hear her softly-whispered ‘No.’

COLLECTIVE HYPNOTISM.

By JOHN DILL ROSS

I RECENTLY read a novel in which the heroine possesses the faculty of collective hypnotism, by means of which she creates a variety of remarkable episodes to the utter undoing of the villain of the plot. I do not know whether such a thing as collective hypnotism really exists, having had but little time or disposition to study this and other phenomena connected with hypnotism. But during my long residence in Singapore I saw three performances given by Indian jugglers which I wish to describe, as I could never obtain any satisfactory explanation of them.

(1) I was on board the Russian Volunteer Fleet troopship *Kostroma*, lying at Tanjong Pagar Wharf, Singapore, busy arranging her despatch to Odessa. While I was on the quarter-deck an Indian juggler with a woman assistant begged permission to give a performance. A space was cleared on the upper deck so as to make a stage for them, and the Indian began by putting the woman into a coarse net, which he fastened securely. He then folded the woman up and put her inside a small oblong basket, trampling her body with his feet until she exactly filled the basket, which he closed with a tightly-fitting cover. It would have been hard to believe that the compact little basket really contained a human body, had we not seen the brutal way in which he packed the woman into it. He next took a long, sharp sword and ran it through the basket in every direction. When he had finished wiping the blood from the blade he opened the basket, and took out an empty net! The woman was found outside the ring of sailors and soldiers who had been eagerly watching the whole thing, which took place in broad daylight on the teak deck of the *Kostroma* before some hundreds of spectators. I got the juggler to repeat the trick at my house next day for the benefit of some of my friends. This time he worked on a floor paved with large squares of polished Italian marble, but with exactly the same result as on board the Russian steamer.

(2) Some friends and I were having tiffin with a man who lived in a house just outside the town of Singapore. At the conclusion of the meal two Indian jugglers came in, and prayed permission to rid the house of the snakes with which they declared it was infested. Our host objected that he had never seen a snake

anywhere near the place, but the Indians rejoined that they would ask no fee if they found no snakes. They then stretched two large gunny sacks on the floor, while one of them, squatting down, commenced playing on a pipe. No sooner had he started piping than first one snake and then another appeared, and within two minutes the room was simply swarming with the reptiles. The Indians set to work with feverish energy to stuff the snakes into the sacks with both hands. When they had been paid their money they left the house with two great sacks on their backs full of wriggling snakes of all sorts and sizes. It was a most unpleasant performance to watch. Not a snake was seen about the house either before or after the visit of the jugglers.

(3) Early one morning I was strolling along the beach near Tanjong Katong with two friends, when we came across two Indian jugglers whose stock-in-trade seemed very simple. They filled a large chatty or earthenware pan with seawater. One of the Indians then took half-a-dozen little ducks, carved out of wood, from a small bag, and threw them into the chatty, where they floated absolutely still. But directly his confederate began to play on a pipe the little wooden models came to life, swimming round the chatty, diving to the bottom, and generally comporting themselves like real ducks in a pond. Whenever the piping ceased they stopped and became little bits of carved wood; directly it started again, they swam and dived as before. There could be no question of the models being manipulated by strings or any other such device. We were standing between the Indians and the chatty. Nor had they any mysterious ‘ray’ at their disposal.

How are these things done? I have an idea that certain Indians know much more about hypnotism and things occult than any European. Is it possible that those various jugglers *willed* that we should see exactly what they intended us to see? If so, in the case of the experience on board the *Kostroma* they must have hypnotised some hundreds of strong men simultaneously, which seems to be beyond the bounds of credibility. Perhaps some of your readers may have a theory.

I have stated what I have seen quite correctly and truthfully, without the least effort to colour or exaggerate effects.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER VIII.—*continued.*

THEY wandered back to the house, and Janet gave Sir Archie tea in a room full of faded chintzes and Chinese-Chippendale mirrors. Then when the sun was declining behind the Carnmore peaks Roylance at last took his leave. His head was in a happy confusion, but two ideas rose above the surge—he would seize the earliest chance of asking Janet to marry him, and by all his gods he must not make a fool of himself at Muirtown. She had challenged him and he had accepted the challenge; he must make it good before he could become in turn a challenger. It may be doubted if Sir Archie had any very clear notions on the matter, but he was aware that he had received an inspiration, and that somehow or other everything was now to be different. . . . First for that confounded speech. He strove to recollect the sentences which had followed each other so trippingly during his morning's walk. But he could not concentrate his mind. Peace treaties and German reparations and the recognition of Russia flitted from him like a rapid film, to be displaced by a 'close-up' of a girl's face. Besides, he wanted to sing, and when song flows to the lips consecutive thought is washed out of the brain.

In this happy and exalted mood, dedicated to great enterprises of love and service, Sir Archie entered the Crask smoking-room, to be brought heavily to bed by the sordid business of John Macnab.

Leithen was there, reading a volume of Sir Walter Scott with an air of divine detachment. Lamancha, very warm and dishevelled, was endeavouring to quench his thirst; Palliser-Yeates, also the worse for wear, lay in an attitude of extreme fatigue on a sofa; Crosby, who had sought sanctuary at Crask, was busy with the newspapers which had just arrived; while Wattie Lithgow stood leaning on his crook staring into vacancy, like a clown from some stage Arcadia.

'Where on earth have you been all day, Archie?' Lamancha asked sternly.

'I walked over to Glenraden and stayed to luncheon. They're all hot on your side there—Bandicott, too. There's a general feelin' that young Claybody wants takin' down a peg.'

'Much good that will do us. John and Wattie and I have been crawling all day round the Haripol marches. It's pretty clear what they'll do—you think so, Wattie?'

'Alan Macnicol is not altogether a fule. Ay, I ken fine what they'll do.'

'Clear the beasts off the ground?' Archie suggested.

'No,' said Lamancha. 'Move them into Sanctuary, and the Sanctuary is in the very

heart of the forest—between Sgurr Mór and Sgurr Dearg at the head of the Rearsuill. It won't take many men to watch it. And the mischief is that Haripol is the one forest where it can be done quite simply. It's so infernally rough that if the deer were all over it I would back myself to get a shot with a fair chance of removing the beast, but if every stag is inside an inner corral it will be the devil's own business to get within a thousand yards of them—let alone shift the carcass.'

'If the wind keeps in the west,' said Wattie, 'it is a manifest impossibeelity. If it was in the north there would be a verra wee sma' chance. All other airts are hopeless. We maun just possess our souls in patience, and see what the day brings forth. . . . I'll awa' and mak' arrangements for the morn.'

Lamancha nodded after the retreating figure. 'He is determined to go to Muirtown to-morrow. Says you promised that he should be present when you made your first bow in public, and that he has arranged with Shapp to drive him in the Ford. . . . But about Haripol. This idea of Wattie's—and I expect it's right—makes the job look pretty desperate. I had worked out a very sound scheme to set my Lord Claybody guessing—similar to John's Glenraden plan, but more ingenious; but what's the use of bluff if every beast is snug in an upper corrie with a cordon of Claybody's men round it? Wattie says that Haripol is fairly crawling with gillies.'

Crosby raised his head from his journalistic researches. 'The papers have got my story all right, I see. The first one, I mean—the "Return of Harald Blacktooth." They've featured it well, too, and I expect the evening papers are now going large on it. But it's nothing to what the second will be to-morrow morning. I'm prepared to bet that our Scottish Tutankhamen drops out of the running, and that the press of this land thinks of nothing for a week except the salmon Sir Edward got last night. It's the silly season, remember!'

Lamancha's jaw dropped. 'Mr Crosby, I don't want to dash your natural satisfaction, but I'm afraid you've put me finally in the cart. If the public wake up and take an interest in Haripol, I may as well chuck in my hand.'

'I wasn't such an ass as to mention Haripol,' said the correspondent.

'No, but of course it will get out. Some of your journalistic colleagues will hear of it at Strathlarrig, and, finding that the interest has departed from Harald Blacktooth, will make a bee-line for Haripol. Your success, which I don't grudge you, will be my ruin. In any

case the Claybodies will be put on their mettle, for if they are beaten by John Macnab they know they'll be a public laughing-stock. . . . What sort of a fellow is young Claybody, Archie?

'Bit shaggy about the heels. Great admirer of yours. Ask Ned—he said he knew Ned very well.'

Leithen raised his eyes from *Redgauntlet*. 'Never heard of the fellow in my life.'

'Oh yes, you have. He said he had briefed you in a big case.'

'Well, you can't expect me to know all my clients any more than John knows the customers of his little bank.' Leithen relapsed into Sir Walter.

'I'm going to have a bath.' Lamancha rose and cautiously relaxed his weary limbs. 'I seem to be in for the most imbecile escapade in history, with about one chance in a billion. That's Wattie's estimate, and he knows what a billion is, which I don't.'

'What about droppin' it?' Archie suggested; for, though he was sworn to the 'John Macnab proposition,' he was growing very nervous about this particular manifestation. 'Young Claybody is an ugly customer, and we don't want the thing to end in bad blood. Besides, you're cured already—you told me so yesterday.'

'That's true,' said Lamancha, who was engaged in tossing with Palliser-Yeates for the big bath. 'I'm cured. I never felt keener in my life. I'm so keen that there's nothing on earth you could offer me which would keep me away from Haripol.—You win, John. Gentlemen of the Guard, fire first, and don't be long about it. I can't stretch myself in that drain pipe that Archie calls his second bath-room.'

Dinner was a cheerful meal, for Mr Crossby had much to say. Lamancha was in morbidly high spirits, and Leithen had the benignity of the successful warrior. But the host was silent and abstracted. He managed to banish Haripol from his mind, but he thought of Janet, he thought of Janet's sermon, and in feverish intervals he tried to think of his

speech for the morrow. A sense of a vast insecurity had come upon him, of a shining goal which grew brighter the more he reflected upon it, but of some awkward hurdles to get over first.

Afterwards, when the talk was of Haripol, he turned to the newspapers to restore him to the world of stern realities. He did not read that masterpiece of journalism, Crossby's story, but he found a sober comfort in the *Times* leading articles and in the political notes. He felt himself a worker among *flâneurs*.

'Here's something about you, Charles,' he said. 'This paper says that political circles are lookin' forward with great interest to your speech at Muirtown. Says it will be the first important utterance since Parliament rose, and that you are expected to deal with Poincaré's speech at Rheims, and a letter by a Boche whose name I can't pronounce.'

'Political circles will be disappointed,' said Lamancha, 'for I haven't read them. Montgomery is taking all the boxes, and I haven't heard from the office for three weeks. I can't be troubled with newspapers in the Highlands.'

'Then what are you goin' to say to-morrow?' Archie demanded anxiously.

'I'll think of some rot. Don't worry, old fellow. Muirtown is a second-class show compared to Haripol.'

Archie was really shocked. He was envious of a man who could treat thus cavalierly a task which affected him with horrid forebodings, and also scandalised at the levity of his leaders. It seemed to him that Lamancha needed some challenging. Finding no comfort in his company, he repaired to bed, where healthful sleep was slow in visiting him. He repeated his speech to himself, but it would persist in getting tangled up with Janet's sermon and his own subsequent reflections, so that, when at last he dropped off, it was into a world of ridiculous dreams, where a dreadful composite figure—Poincarini or Mussolinaré—sat heavily on his chest.

(Continued on page 284.)

AS TOLD BY THE SHIP'S SURGEON.

PART II.

THERE are still professional gamblers loose on the Atlantic, ready to play with any one who has more money than brains. The present set are fairly crude, and they lack the soft, sweet ways of some of the pre-War polished crooks. It is not in public rooms that they get busy—but in private rooms. After hours they put in fine work and pull the fleece off innocent lambs. But it takes two at least to gamble, and if, in the face of prominent warning notices posted every-

where, the fly chooses to walk into the spider's parlour, then he deserves to lose a wing or two.

The ship's concert is still a feature of the voyage, and is given mainly in order to collect funds for the seamen's charities. With this in view these entertainments are tolerated, and travellers are remarkably benevolent year after year in their donations. Otherwise, passengers are bored to death with them, and avoid them unless there happen to be prominent artists on

the programme. Even amongst the professionals, many of them, tired out and requiring a rest, do not wish to be disturbed. The big stars are unwilling to be heard under any unfavourable conditions, while not a few of them are strictly prohibited by the terms of their contracts from singing on board. Nor will some great violinists expose priceless instruments to sea air, which invariably damages them. Therefore it is unfair even to ask them, and I never call upon their services unless they themselves make the first offer. Many artists whose close friendship I enjoy are always willing to give unstintingly of their best for the good cause. Out of a long list I would mention casually John M'Cormack, Josef Hoffman, Marie Novello, William Backhaus, Elsie Janis, Nora Bayes, Ruth St Denys, Maurice and Leonora Hughes, and the Dolly Sisters.

In the old days the amateurs on board fairly revelled in these concerts, and the trouble was to prevent their all singing at once—and all night at that. Poor dear old Paolo Tosti! How often, I wonder, have I heard his 'Good-bye' song murdered by singers of all sizes and shapes, more than one of whom would insist on saying, 'Good Boy, Summer!' Of many funny incidents I recall one on the *Celtic*. A tall, raw-boned westerner was singing some weird prairie song. His lady accompanist was doing her best, but he had taken a dislike to her methods. Half-way through the second verse he stopped short and, turning round to her, said, 'For heaven's sake stop playing and let me finish it alone.' She did so, and it nearly finished the audience, who were convulsed with laughter. Quite likely, for many of the concerts I did organise, I ought to have been imprisoned; but the audiences were always friendly, and we got money for the orphans—so what did it matter?

To-day the dance is the thing, and the dance they will have. On long voyages there is nothing to compete with the fancy-dress ball, where I have seen original costumes that would have won prizes at a Covent Garden festival. On a fast liner, where the voyage is over before you know your neighbour's name, there is no time to organise one; but with masks and dominoes you can make a merry evening of it.

A few items concerning the ship's crew. On my present ship, the world's largest liner, *Majestic*, there are three departments—the deck, engine, and victualling.

The deck has seventy members all told. Not many of them are real 'sailors.' Most are young fellows who can do the paint-work and the washing of decks. I miss the 'shell-back' of olden days. He was gruff, and loved to growl; but he was good-hearted, and had a choice vocabulary in bad weather. Rarely did he sham sickness, but when off colour he made a fuss about it, and liked to be coddled—especially if he thought a tot of rum was in sight.

The chief engineer has seventy engineers under him, besides many other experts. These are needed to keep going 240 fires fed by oil fuel, of which 5000 tons are consumed during a five and a half days' voyage from New York to Southampton. The oil attendants and cleaners necessary are but a few compared with the firemen and trimmers of coal days. These oil chaps rarely are sick or get maimed. Theirs is a gentleman's job, and I often chaff them about wearing evening dress down below. The 'Black Gang' of coal days were a different breed. They were supposed to be the thorn in the surgeon's side. Perhaps they were. Some of them were high-class malingerers, if they could get away with it—but otherwise good sports. Once, on the *Baltic*, they got hold of a new chum who was in my place for a voyage. What with 'heart disease,' 'exhaustion,' 'pains all over,' 'can't sleep or eat,' they nearly had the ship stopped half-way across.

The victualling department is large, and totals 700 out of the 1090 of crew carried. These stewards, scullions, &c., are known collectively as 'the boys' (some of them are over fifty), and live in quarters known for generations as the 'Glory-hole.' Many of these boys are what Tom Webster, cartoonist of the *Daily Mail*, would call 'lads of the village,' which includes a variety of accomplishments not mentioned in the ordinary text-books. They have to work hard, and most of them do so apparently with good nature. Now and then one comes across the 'sea-lawyer,' who would like to argue the point whether he should or should not work; but there are too many ex-service men waiting for vacancies, and therefore 'strikes' to-day are not fashionable. Bedroom stewards and stewardesses are experts in dealing with the quips and crank-spots and vagaries of the thousand and one varieties of travellers of all nations and natures who insist upon having large breakfasts in bed, and who love to play symphonies on the bells which summon attendants to their presence.

Frank King, my senior hospital attendant, is a host in himself, and the uncrowned king of all the 'lads.' He has served the White Star Line faithfully for over thirty years, and looks good for another thirty. He knows the pedigree of every steward, scullion, baker, and butcher in the fleet. What he does not know about their imaginary ailments is not worth writing home about.

There are several real 'girls' on the ship—stewardesses, hairdressers, manicurists, telephone operators, bath attendants, and a mermaid in the swimming-pool. They are all too good-natured and prosperous to be sick.

I am bad at figures, but I think I am right in saying that, for one voyage alone, the ship carries: 40 tons of meat, 14 tons of fish, 6 tons of sugar, 5 tons of butter, and 60,000 eggs, besides tons of other food-stuffs. In the linen

department over 170,000 pieces are stored away.

Purser McElroy, the ever genial, clever, witty Irishman who went down with his brother-heroes on the *Titanic*, was responsible, I think, for saying, 'There are three kinds of people in the world—men, women, and passengers.' It needed a ship's officer with long experience and deep knowledge of human nature to make such a subtle classification.

They say that everything good, bad, and indifferent is apt to come out in a community of travellers thrown together in a ship at sea. Probably it does in a long voyage, where there is time to unmask. On the Atlantic the camouflage may be more difficult to detect. Some are natural, and really are what they say they are and seem to be; others act well, and are nothing like what they would have you believe they are. More certain it is that, even in one week, water will find its level, and birds of a feather will flock together. The real 'nice people' and the 'just plain' folks, as the late President Harding called them, will manage to commingle; the 'high-brows,' both social and financial, will meet on deck, but not before luncheon; the 'cultured' ones will only discuss art, literature, or anything else they know nothing about; politicians will settle everything their own way; noisy ones will talk louder the more there are round to annoy; the adventur-ers and -esses will signal and cross-signal to each other; thirsty ones will be chummy with the smoke-room 'boys'; gamblers claim certain corners as their own; exclusive ones wear the veil throughout; and the Jap remain the eternal mystery.

Each voyage there is sure to be a number of folks who 'complain' about their accommodation, or the ventilation, or the food, or the service, or the decks being too wet, or the ship's 'noises' keeping them awake, or a hundred and one other matters. A large number of these complaints are foolish and unnecessary, but they have to be listened to, mainly by the purser and the chief steward, whose patience and forbearance and self-control are really remarkable.

Meanwhile, the ship's surgeon, if he has any experience or tact, will be friendly with all passengers, irrespective of their race, position, or pretensions. Personally, I have found some travellers quite bad, a great many of them very good, be they English or American, rich or poor, Jew or Gentile, white or black. All might well take lessons from one another—gathering in the good points, discarding the bad ones. The resultant would then be Utopia. Half the complaints the Englishman makes about the American and *vice versa* are purely imaginary, and due to ignorance of the grand old rule of 'Give and Take.'

Of course, on the *Majestic* I meet a great many more Americans than English. I am proud to say that I possess amongst them many

hundreds of valuable friends, whose kindness and hospitality to me have been unbounded. Not a voyage nowadays passes without my having some of them around me, and it is a pleasure and a privilege to be on the great Atlantic lines of communication, and keep up the good work of promoting goodwill between the two great English-speaking nations.

From the first I have always had a real affection for the third-class passengers or emigrant class. Here let me state that the word 'steerage,' as applied to them, is out of date and discarded—very rightly so, because their quarters and personal status have been so much raised that the objectionable word 'steerage' (that is, belonging to the steering end of the ship) no longer applies. I admire the patience, perseverance, and pluck which leads them, whole families at a time, to pack up what little they possess and start out on the great quest for the Land of Promise—thousands of miles away. The idea that the emigrant is always ill and a trouble to the doctor is quite wrong. On the contrary, he is hardy, and will even try to conceal his illness rather than be prevented from landing in America.

On the subject of sea-sickness, I cannot do better than give a transcript of a short 'speech' I made recently at the big radio broadcasting station at Newark, New Jersey, U.S.A. It is as follows:

'After making five voyages round the world, and having crossed the North Atlantic over seven hundred times, I have received a suggestion that I may know something about sea-sickness. For once in history you are going to get the truth from a doctor, when I tell you I know as little about the cause of sea-sickness as I did thirty years ago, when I made my first voyage to New York.

'It is only proper that the folks who know most about the complaint are land-lubbers—the people who don't know the sharp from the blunt end of the ship. In my time I have addressed several medical societies on the subject of sea-sickness. I have blamed every square inch of the human body as being the starting-point of the trouble. No doubt I owe a humble apology to every one of them. As for 'cures,' a new one comes out every week. I must have tried five hundred of them myself. This leaves the fifty-seven varieties of pickles away back. Most of them make the patient worse than ever. If I knew the real cure I would have given up sea-life long ago, and have occupied an elegant suite in Fifth Avenue, where my staff would hand out the dope at two dollars a packet while I was spending the winters running round Palm Beach in a gold-plated car.

'The very best cure for sea-sickness is to stay at home. Even that sometimes fails, for I know a Philadelphia lady who gets sick while she is in the agent's office booking her passage; so

that Philadelphia is more ahead of the times than you would think.

'What little we do know about sea-sickness is that it is a symptom and not a disease. What it is a symptom of, nobody knows; but every one guesses. It never kills—which the patient sometimes thinks unfortunate, for generally he wishes he was dead. One always feels better after it is all over, and it is a great pity we don't have it on land to counteract over-eating.

'On our large modern liners the complaint has diminished very greatly. During fifty crossings on the great and wonderful *Majestic*, I have not had two cases that caused me a minute's anxiety.'

They say that many a 'true thing is said in jest. At any rate, truth is always stranger than fiction—which I offer as a justification of my remarks on sea-sickness.

So much has been written about the Great War, of which we Mercantile Marine men (and women) had enough and to spare, that I feel disposed to say only very little about it.

In common with thousands of my mates, I made some 102 crossings over danger zones in various ships of the White Star Line fleet. During all these I was extremely lucky, for I never once 'got my feet wet,' as a pal of mine expresses it. But I escaped on four occasions from torpedoes actually fired at ships on which I was serving. The closest shave was on the *Baltic* one fine morning in July, when a big torpedo shot past our bow and missed only by inches. At the same time we were on the limit of the zig-zag which was taking us towards the projectile; otherwise we should probably have been hit amidships. On the *Megantic* a torpedo shot past us, only forty feet away, but parallel to our own course. As it was going double our speed, we were safe enough. Off Holyhead one evening a patrol boat and a destroyer sank a 'sub' with depth bomb charges. We were five hundred yards off, but the concussion shook the big *Baltic*, and brought her to a standstill almost for a few seconds. Two hundred and fifty American nurses on board behaved with the greatest coolness, walking up to their boats as if it were an ordinary boat drill. Any women on board always behaved admirably during any crisis. One only did I meet during the whole War who was fear-stricken, and for precaution's sake we landed her at Halifax before sailing east. Poor soul, she was brave enough too, for she was going over to try to get news of her soldier son who had been reported from the 'Front' as missing for six weeks. The night the *Tuscania* was hit my ship was just in front of her in the convoy. I left the *Cymric* the voyage before the Huns got her. The great and beautiful hospital ship *Britannic* I also left the voyage before she was torpedoed in the Aegean Sea. I was on the *Olympic* the memorable day

she stood by the sinking battleship *Audacious* for six hours outside Lough Swilly. Four great hawsers broke while we tried to get hold of her and tow her into safe waters; so with great sorrow we had to leave her to her fate.

The first six weeks of the submarine danger were perhaps the worst. I was foolish enough then to lie down at night all dressed, with my lifebelt at my side. One morning I woke up to realise that the remedy was going to be worse than the disease, and that the system was getting on my nerves. Thereafter I undressed as usual, having, after a couple of rehearsals, found that in seventy seconds I could be ready to get into a boat.

There are many instances of ship's men who were torpedoed once, twice, and up to five times, yet who signed on again as soon as possible after getting to shore. I may add that I do not know of one single instance of any stewardess who ever refused to go to sea even when the submarine danger was at its height. To them and to all the brave women ashore who never flinched from duty during those dreadful years, I am proud to take off my hat.

THE END.

SOME FORGOTTEN GRAVES.

THEY lie in their graves on the moorland
The men of a by-gone race,
And winds sweep in from the seaward
And sigh o'er the lonely place.

No mourner remains to bewail them,
And no one to spare them a tear;
They rest from their labours in silence
While year slips away after year.

They heed not the years that are passing,
They heed not the change of days;
No cry of the battle could rouse them
To speed o'er the moorland ways.

They lie unwept and forgotten,
Alone in their lonely graves,
With never a record to tell us
If once they were kings or slaves.

They lived, and they loved, and they suffered—
No stirring of life is there,
Excepting the swift, soft passing
Of feet of the moorland hare.

No voice breaks into the silence,
Excepting the curlew's cry,
Or, sharply, the call of the moor-cock
To his mate, as he passes by.

And sheep, perchance, may stray over,
And bleat to their lambs as they pass;
Treading their way through the heather
In search of the moorland grass.

But no one can tell us the story
Of those who lie, silent and still,
Wrapped o'er with a shroud of the heather,
On the seaward slope of the hill.

ALICE M. CAMPBELL.

THE MONTH: SCIENCE AND ARTS.

THE ROTOR SHIP.

MOST readers of *Chambers's Journal* must long ago have seen descriptions and illustrations of what is known as the 'Rotor Ship.' Any reference to it in these pages has been purposely postponed until reliable data were available. Fantastic claims were made at first for what the rotating towers would do, but these have since been greatly discounted, though it remains true that their propulsive effect is greater than that of sails, and that they have other important advantages. The principle upon which the towers work was discovered by a German named Magnus about the middle of last century. The method of applying the principle to the propulsion of ships was devised recently by Flettner, another German, who also originated the rudder which was described in our issue for January 1923. Effects only are dealt with in the following description—not how they are brought about. Imagine, in the first instance, a vertical cylinder or tower upon which a wind is blowing. The wind will cause a pressure on the side towards the wind, and a suction on the opposite side. One important point to be borne in mind is that the suction is much more powerful than the pressure. If the cylinder is made to rotate (say, by a small electric motor), two very interesting effects are produced: (1) the combined pressure and suction increases with the speed of rotation, until the result may amount to twelve times the force on the stationary cylinder; (2) the direction of this combined force (a pull) moves round against the direction of rotation until its angle with the wind is reduced from 180 degrees (directly opposite) to 100 degrees at the highest speed. This means that a ship fitted with the Flettner towers sails fastest when the wind is 10 degrees aft of a right angle with her keel, because the pull is then straight ahead. Experiments have shown that to get the most powerful pull the peripheral speed of the cylinder should be between three and four times the velocity of the wind. It may be explained at this point that a ship need not have more than one tower, although the experimental ship has two. It is simply a question of getting enough power. Larger vessels may require more than two towers. Some may object that, with the wind right aft, the pull will be to one side—instead of right ahead, as with sails. Sails, however, do not give the most powerful results with the wind right aft, and, although the pull of the towers under this condition is not so great as that of sails, once the wind comes a little to one side the towers have the advantage. On the average, if we take all points of sailing into considera-

tion, the towers have a greater propulsive effect than sails of twelve times their area, reckoning the area of the towers as being represented by the height multiplied by the diameter. Now we come to a very curious feature, namely, the greatly decreased risk of capsizing in a gale shown by the tower-equipped ship as compared with one fitted with sails. This arises from the fact that the pull on the towers varies with their speed of rotation relative to that of the wind. We will suppose that the towers have a peripheral speed of 82 feet a second—about $3\frac{1}{2}$ times that of a wind of 16 miles per hour. If the wind increases, the capsizing force will increase up to about 30 m.p.h., but after that it remains almost constant up to hurricane force. A wind of 16 m.p.h. is a nice working breeze, in which a sailing vessel will just carry all sail and make her best speed. The captain of a rotor ship need not worry about gales; all that he has to do is to see that his towers are not running too fast. No crew is required to attend to the sails, as in a sailing vessel. It is true that the towers have to be rotated, and that power is needed for this purpose, and that some one must attend to the machinery; but the power required is very small, only 9 h.p. for each tower in the experimental ship, with the towers giving a propulsive effect equal to 800 h.p. Time alone will show whether the rotor ship has come to stay. It seems to have possibilities for sailing craft, and the towers may be utilised to save power in steamships and motor vessels.

PAMPHLETS ON RURAL INDUSTRIES.

To this valuable series of booklets, referred to in our issues for March and July of last year, there have recently been added pamphlets dealing with 'Book-keeping for Small Rural Industries,' 'Costing for Small Country Workshops,' 'The Country Wheelwright and His Outlook,' and 'Water-Power.' Copies may be obtained from the Secretary, Rural Industries Bureau, 258-262 Westminster Bridge Road, London, S.E.1.

A COT-SETTEE.

In these days of small families, that necessary but costly item of the household, the baby's cot, has but a short useful life. A novel type that has been lately brought out is convertible into a settee after its occupant has grown too big for it, while it possesses unusual features as a cot. Built of wood, the cot's outstanding departure from the standard design is a removable side which tucks away under the mattress when out of use. In position, the top and bottom are secured at the ends by ball and socket fittings, the releasing of which entails the lifting of the side bodily, an operation

beyond the strength of any infant. The bottom ends slide in under the mattress on metal guide-bars when the side is removed. The other side is also removable, and is secured in a similar way, but as it is only taken off temporarily to make the bed, no provision is made for stowing it under the mattress. When both sides are out, the ends are firmly held by the iron frame of the spring mattress. This frame is of a specially strong type, to support two 'grown-ups' as a settee. Deeper and therefore safer than the usual pattern, these cots are handsomely finished in white enamel, Jacobean or fumed oak, or in polished mahogany. The metal fittings, which include castors, are of nickel-plated brass.

A REFRIGERATOR FOR THE HOME.

We are fast approaching the time when a refrigerator will be considered a necessity for every well-to-do household, so advantageous is it to be able to keep foods fresh in the hottest summer weather. Several makers of small freezing-machines are fully alive to this development, and one or two which are suitable for household use are already on the market. One has already been described in these columns; another, which we recently saw working, is a particularly compact and reliable outfit, and has some special features. A most important item is the cabinet, which houses the machine and the cool chambers. This cabinet is very strongly made; the doors are a close fit, and have nickel-plated metal fittings of massive design. A compartment in the bottom contains the machine; the upper part is divided down the middle into two. The left-hand compartment is again divided by a horizontal partition, the upper chamber containing the brine tank which does the cooling, and the lower chamber serving as a storing place for foods and drinks. Five movable wire shelves are fitted in the right-hand compartment, which also serves for the storing of foods. The two food compartments are lined with steel enamelled in white porcelain, which is easily kept clean. The whole of the upper part of the cabinet, including the doors, has double walls, between which is a most efficient heat-insulating material. With bevelled paneling and white enamel all over, the cabinet is a handsome piece of furniture. It measures 68 inches in height, 39½ inches in width, and 25½ inches in depth. We will now try to explain briefly how the cold is produced. All refrigerators are based on the fact that certain liquids boil and give off vapour at very low temperatures. The liquid chosen in this case is sulphur dioxide, which boils at 14° F. Now to turn a liquid into a gas heat is required; e.g., to turn water into steam fire of some sort is necessary. Heat and cold, however, are relative terms. Compared with the temperature at which sulphur dioxide boils and turns into gas, the atmosphere,

except on a very cold winter's day, is hot; in fact, it supplies the heat required to make this liquid boil. If a saucer of liquid sulphur dioxide were placed in the cabinet and the doors were closed, the temperature would be quickly lowered, because heat would be taken from the air to boil the liquid. But the process would not be continuous; either the sulphur dioxide would all be changed into vapour, or the temperature would be so much reduced that the change would no longer take place. What is wanted is apparatus which will allow the evaporation to go on, and then convert the gas into a liquid again, ready to be used once more. This is exactly what a refrigerating-machine does; but the gas is confined to pipes instead of being allowed to escape into the cold chamber. Liquid is admitted in very small quantities into a pipe which passes from the machine and into the brine tank, in which it takes the form of a coil making many turns. Here it takes heat from the brine to turn it into gas, and the brine in turn takes heat from the air in the cold chambers, thus reducing the temperature in the chambers to the necessary point. In the machine is a tiny gas compressor driven by an electric motor, which draws the gas from the coil and compresses it within a water-cooled dome. Here it is condensed into liquid again, ready for admission into the cooling coil once more. The machine is entirely automatic, the motor being started and stopped by a thermostat in the cold chamber, which switches it off when the temperature falls below a certain point, and starts it again when it rises to that point once more. But what most distinguishes this machine from others is a patented device which entirely prevents any escape of gas when the machine is stopped and the pressure rises, as, apart from the gas being an irritant, its escape would soon deplete the supply in the machine. Much trouble has been experienced from this difficulty before this device was thought of. To prove the general reliability of the outfit, the makers started one running on 2nd June, which was still working satisfactorily at the time of our visit on 9th January, having had no attention during the interval. This period of continuous running is considered to be equivalent to four years of ordinary use. The power required is very small, the cost of current for a year amounting to about 50s. at 4d. a unit. It may be added that there are in the brine tank specially constructed drawers for the purpose of making cubes of ice for table use or for freezing creams or dessert.

A NOVEL VACUUM CLEANER.

Continuous efforts are being made to improve the vacuum cleaner, some of which have been recorded in these columns. A model which has recently been introduced from the United States and is now on sale in this country possesses several novel and advantageous features. To begin with,

the form differs widely from that of other vacuum cleaners. The case is shaped roughly like a stepped cone with a rounded apex. This case is of aluminium, and is fitted with a convex lid at the broad end. A tiny electric motor is installed in the small end of the cone, and this carries a powerful air-exhausting fan on the upper end of its spindle. In the big end of the cone is the dust bag, which is prevented from being sucked into the hole over the exhauster by a wire cage. A rubber ring at the mouth of the dust bag makes an air-tight joint between the cone and the lid. The motor is connected by flexible leads to a lamp-socket. When it is switched on, the armature, with the fan, whizzes round at a high speed, and creates a strong suction under the dust bag, through which the air passes, leaving the dust behind. The air is discharged through holes in the side of the machine. A length of flexible pipe is attached to the middle of the lid of the case and terminates in a nozzle which can be used for cleaning upholstery. For floors and curtains a rigid length of pipe is pushed into a socket in the base of the nozzle, this pipe having the usual wide nozzle at its outer end. Access to the dust bag is obtained in a few seconds by unscrewing two thumb-screws for a few turns, when a slight twist releases the lid of the case. When at work the machine rolls about the floor, accommodating itself to the demands of the operator. An outstanding feature of this cleaner is its lightness, the weight being only $7\frac{1}{2}$ pounds. The flexible pipe allows of corners and the narrow spaces under low furniture being reached. Special bearings are fitted, through which the oil percolates slowly, the result being that they require no further lubrication until new carbon brushes are needed, a period of from $1\frac{1}{2}$ to 3 years, according to the amount of use. Finally, the price is very moderate.

TYPING BY ELECTRICITY.

Apparently the electric typewriter has come to stay, as that described below is the second to which reference has been made in these notes. The machine which has recently been brought out is very similar to the one that formed the subject of a paragraph in *Chambers's Journal* for July 1923, such differences as exist between them relating to details rather than to the general principles involved. It is not necessary, therefore, to give a lengthy explanation of the second. The essential feature is a shaft with teeth on it which crosses the machine under the type-levers. This shaft is rotated at 300 revolutions per minute by a tiny electric motor. The lightest of touches on the keys engages the type-levers with the teeth on the rotating shaft, which operate them as would be done by the fingers. Whether the keys are touched lightly or hammered down makes no difference to the weight of the blows struck by the type; the

typing is, therefore, absolutely uniform. Means are provided for increasing the strength of the imprint for several carbon copies or for stencilling, while safety devices ensure only one movement of a type-lever if a key is held down, and prevent the operation of two levers at the same time should two keys be pressed down at once. The motor is of the universal type that will run on continuous or on alternating current, and on any ordinary supply voltage. It can be connected to any lamp-socket, and the amount of current consumed is almost negligible. Apart from the electric driving, the typewriter is similar to other high-class machines.

THE BIGGEST SUSPENSION-BRIDGE IN THE WORLD.

The United States has always specialised in the biggest features of the world's industrial equipment, and its bridges seem likely to form no exception to this rule. A bridge across the Hudson River has been in contemplation by the municipal authorities of New York since 1910. According to *Irish Engineering* new plans for the bridge have been worked out recently by Engineer O. H. Ammann of New Jersey. A suspension-bridge is proposed, with a span of nearly two-thirds of a mile between supports, which will rise to a height above the water-level of 689 feet. This span is exactly double that of the suspension-bridge over the Delaware at Philadelphia, which is at present the longest of its type. The main roadway, which is to be 80 feet wide, will accommodate eight lines of vehicles, and walks at each side will have a width of 15 feet. The most unusual features of this bridge, however, are two lines of tramways below the sidewalks, intended for express traffic. The total width of the bridge is 126 feet, while the height above the water-level is 210 feet. This bridge is designed to carry half as much traffic again as any other in existence or being built. It is to be supported on enormous chains, which are arranged in pairs, the one above the other, at each side. The cost is estimated at \$35,000,000, or about £7,250,000.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, Chambers's Journal, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

A COUNTER-ATTRACTION.

By ROWLAND BURGESS, Author of *Luck of the River*, *The Doom of the Zeppelin*, &c.

CHAPTER I.

I.

SIR WILLIAM ROTHERTON was disturbed. Mayor of Porthampton, and managing director of the mammoth drapery and general store that bore his name in letters of gold over its vast expanse of plate-glass window, he was giving audience to the shop-walker of the 'Foreign Fancy' department.

'Quite right to mention it, Mr Johnson. How long has it been going on?'

'Ever since Lieutenant Rotherton's ship came into port, Sir William.'

Sir William's shaggy brows came down over his keen eyes, and he ran his fingers through his iron-gray hair. 'Humph! The boy's a sailor, and has a breezy way with the girls. Maybe it's only a counter flirtation.'

Mr Johnson looked grave. 'I'm afraid not, sir. Miss Maddison gave notice to leave this morning.'

'Did—eh? Then there's nothing more to be said. Good-morning.'

Mr Johnson bowed, and retired from the presence with flat-footed dignity.

Sir William, alone in his luxuriously-furnished office in the heart of the huge building, leaned back in his chair, with his elbows on the padded arms and the tips of his fingers touching lightly, and remained for some minutes deep in thought. 'Another of Johnson's mare's nests,' he decided at last; 'Harry's straight. Some fluffy-haired little fool—leaving, is she? Still—well, let's have a look at the girl.'

He unhooked the house-telephone that kept him in touch with all departments. 'Foreign Fancy. That you, Johnson? Send Miss Maddison to me. Serving? What's that? Mr Harry? Soon as she's disengaged, then.' He slammed the receiver on its hook with a crash.

II.

If it is true that 'all girls love a sailor,' there could have been few whole hearts left in Rotherton's. Even the dapper young men hurrying back and forth laden with rolls of dress material felt adventure faintly stirring in their blood, as

Harry Rotherton, of H.M.S. *Dragonfly*, with dark hair crisped by the salt wind, and cheery, smiling face tanned to the colour that only rain, sun, and the breath of the sea can give, passed them on his way to the 'Foreign Fancy' department.

In the heated air of the crowded, bustling shop, where, in spite of the whirling fans overhead, the faint odours of wool and dye-stuffs still lingered, the young sailor seemed strangely out of place.

Mr Johnson of the flat feet and supple backbone, smilingly headed him off from Rose Maddison's counter, and summoned a flamboyant damsel with yellow hair to wait upon him.

He was a young man of direct methods, however. 'Thanks, Mr Johnson. Don't quite know what I want yet. I'll look round a bit, and wait until Miss Maddison is free.'

Mr Johnson hung about in the offing while Miss Maddison produced cigar-cases for Harry's inspection, until the plaintive cry of 'Sign' summoned him to a distant counter.

Harry wasted no time. 'Confound all this trash,' he said, impatiently pushing aside the goods he had been examining. 'You know well enough it isn't cigar-cases I want to talk about, but with this beastly counter between us, and all these folk prancing about—here comes that rubber-neck again—yes, this one will do, thank you.'

Again the frock-coated shepherd was called away by the bleat of a distant sheep.

'Now, Rose—'

'Please, Mr Rotherton! Remember this is not a garden-party at Seagrove Court. That is all ancient history. I am a shop-girl now, with my living to earn, and you are making it terribly difficult.'

'If you'd only be sensible, and let me talk to you somewhere else. Hang it all—here he comes again!'

A drunken croquet-ball came wobbling along the overhead switchback, and fell with a thump into the leather-padded rat-trap by Rose's side.

The momentary touch of her hand, as she handed him bill and change, sent the hot blood

racing to Harry's head, but the bland and oily presence of the shop-walker at his elbow prevented further speech. With firm, set jaw and angry, determined eyes he strode through the swing-doors into the street.

Mr Johnson, with a gleam of triumphant malice in his eyes, delivered the summons to Sir William's office, and, with his hands clasped behind his back, resumed his slow promenade of the floor.

III.

Sir William, seated in lonely state at the head of the leather-topped table that graced his office, expecting the advent of some pretty, flighty shop-miss, to whom he proposed to read a homily on the sin of counter flirtations, more especially when the customer happened to be the son of the firm, was somewhat taken aback when confronted with a tall, graceful girl, her severely-plain black shop-dress falling in soft, natural folds around her slender figure as she moved with a quiet dignity across the thick Turkey carpet, seeming far more at home in the sober luxury of her present surroundings than ever she did at the counter.

She stood facing him, a courage akin to his own shining out of her brown eyes, waiting for him to set the note of the interview.

Repressing his first impulse to rise and bow, he asked her to be seated—a rare honour in this room—and for once in his life seemed at a loss for words. 'Ah—Miss Maddison, I—ah—you are acquainted with Lieutenant Rotherton, I am given to understand?'

She bowed in answer, a slight smile playing round the corners of her lips at the great man's embarrassment.

'You are, of course, aware that it is a rule of the house that all relations with customers must be kept on a strictly business footing?'

'As an employee of the firm, of course I have read the rules, Sir William.'

'Quite so. Now it has been reported to me that there seems to be some sort of——'

'Plain speaking will be best in this case, I think,' she interrupted him, two flaming spots of colour mounting to her cheeks. 'I am accused of flirting with your son; is that it?'

'Since you prefer frankness, that is so.'

'You have a right to know the facts. Mr Rotherton wishes to renew an old friendship that existed between us some years ago, under far different conditions, when we were little more than boy and girl. I quite realise, as he does not yet appear to do, that in the circumstances this is utterly impossible.'

'Hm! A strange story! How far had this "friendship" gone, and what were the "different conditions"?''

Miss Maddison rose from her chair, and stood facing him with blazing eyes. 'I thought you were a gentleman, Sir William!'

'Now just sit down again, Miss Maddison. You asked for plain speaking, and you shall have it. In the first place, I know honesty when I see it, and I don't doubt that every word you have told me is true. Had you been the sort of girl I expected to see, you would have been sent back to your counter with a word of warning. Having seen you, I take a more serious view. I am not so sure that, on Harry's side, at any rate, the feeling will stop at "friendship"—unless men have changed greatly since I was young. You are a sensible sort of girl, and I look for a straight answer to this question: Is there any necessity for me to take action in the matter?'

'Beyond waiving the formality of notice, and allowing me to leave your employment at once, there is none, Sir William.'

He leaned back and thought for a minute. 'Ay, ay, perhaps that's best. You are a plucky girl, and I'm sorry. It isn't my "ungentlemanly" language alone that decides you, I take it?'

There was a spark of humour growing in his eyes, and for the first time Rose showed signs of confusion. 'Indeed it is not. Your frankness I take as complimentary. But, please, need we discuss the matter any further?'

'Still a bit nettled, eh? Well, well, I see pretty well how matters stand; we will let it go at that. Gentleman or not, if I have hurt your feelings——'

'Oh don't, Sir William. I am so sorry——'

'No apologies needed. I like your spirit, and the way you got down to it with the gloves off at the start. Care to tell me anything about the "different conditions" you spoke of?'

'Does it matter?' said Rose, rather wearily. 'It is the present conditions only that concern us.'

'Just as you like. I shall pay you a month's salary in lieu of notice—I think you are entitled to that, and I expect you would bite my head off if I offered more—but that won't last long. I feel sort of responsible for you, and want to help you all I can.'

He turned to his desk, and wrote a note, which he handed to the girl.

'Margrave and Wilson; best firm in the West End,' he said, indicating the address on the envelope. 'You are just the type of girl to suit them. You will do better there than in a cheap middle-class trade like ours. Managing director is a personal friend of mine, and I'll write him privately. Anything more I can do for you?'

'Nothing, thank you. But believe me, Sir William, I am grateful for your kindness.'

'That's all, then. Stop a bit, though. Tongues will be wagging downstairs by this time. Come back here when you have got

your hat on, and we'll give them a better tune to wag to.'

Twenty minutes later, whispering groups of assistants dispersed hastily, and broke into feverish activity, electrified by the sight of Rose Maddison, in outdoor dress, chatting in a friendly manner with Sir William, who escorted her to the door, and shook hands with her ere she passed into the street.

Nothing short of paralysis of the tongue would have stopped gossip, naturally, but the rags and tatters that Rose's character were being busily torn into were instantly transformed into glittering silken robes.

CHAPTER II.

I.

BENEATH the age-old trees that bordered the smooth lawns of Cedar Grange, Lady Rotherton sat preening herself. Her tennis-party was going well. Harry was playing an athletic game with Irene Seagrove for partner, an arrangement that met with his mother's entire approval.

True, she could have wished that the girl would observe a trifle more reticence in the display of limb, and wear just a *little* more underclothing beneath that extremely thin frock, which might with advantage be six inches longer. And was it necessary, when serving, to stand on one leg, and kick the other high in the air, or to chase the ball *quite* so vigorously, with such long, inelegant strides?

Tennis was quite a different game when she was young, and if the girl were *her* daughter—well—perhaps . . .

Certainly they were well matched. The cousinship was a *very* distant one, and Irene's father was something important at the Admiralty, a very useful connection for Harry—that is—if . . . One could never be sure with young folks of the present day.

Harry seemed impervious to hints. He agreed readily—too readily—with her that Irene was a charming girl—a 'good sport and a ripping tennis-player' was his own version; but beyond that . . . Perhaps his father, if he were not so wrapped up in his business . . .

The 'business' was ever a thorn in the flesh to Lady Rotherton. She was herself a Seagrove; she had married when by no means in her first youth, and Sir William already middle-aged—and wealthy. It had turned out remarkably well, as such marriages often do, when neither partner expects too much devotion from the other.

Still, in Porthampton, it was impossible to ignore the fact that she was the wife of a tradesman, although an extremely successful one. All her friends had been very nice about it, however, and showed no hesitation in coming

to her dinner-parties. Indeed, with the men Sir William was *persona grata*, and even their wives admitted that he was 'an old dear, and really almost—'

If only he would retire, and stand for Parliament! But this was the one point on which he was adamant; yet, curiously enough, he was by no means disappointed that his son should not have followed in his footsteps.

II.

The game finished, Irene came and sat by Lady Rotherton, while Harry went in search of tea.

'Don't you think you should put on a cloak, or something, dear? You must be hot, and your dress is *so* thin.'

Irene laughed. 'Hot? Why, it was only pat-ball, auntie. We smothered them standing still!'

'Indeed? To me it seemed an extremely strenuous game, and I thought you and Harry played *so* well together.'

'Oh, Harry's a trier all right, but he's not up to Wimbledon standard. You know I've entered for the ladies' singles at a tournament next week?'

'So he told me. Poor boy! At sea all the time, he gets so very little practice. You must teach him the modern methods. I am *so* pleased that you are such good friends.'

'Why, of course we are, auntie. Didn't he pull me out of the pig-sty by the heels when I overbalanced, trying to tickle the sow with a stick? And didn't I push him into the duck-pond?'

'Ah! You were but children then. It is different now.'

'What is different, mums?' said Harry, coming up with a tray of tea-cups, in time to catch his mother's last words.

'Auntie and I were sentimentalising over the days of your vanished youth, Harry. Do you remember putting teasels in my hair?'

'Do I not? I found my pyjamas sewed up that night, and holly leaves in my bed. But you caught it later on, my lady!'

'I know. A wet sponge gives me the shudders yet. But perhaps it would be more decorous to draw a veil over subsequent details.'

'Much better, *my* dear,' hastily interposed Lady Rotherton.—'There is your father's car, Harry. I must run in and speak to him. You might show Irene the new rose garden; I am sure she would be interested.'

She sailed away, and for a time there was an awkward silence between the two young people. Their eyes met, and they both laughed.

'Well?' said the girl.

'Well?' countered Harry.

'Aren't you going to propose, then? That's what your mother left us alone for, you

know. She said I was to "teach you modern methods"!' "

'Should love to, if I thought you'd promise to "be a sister to me." Will you?'

'Will I what?'

'Oh, come along to the beastly rose garden, and let's have it out. Too many people about here.'

'All right. Is this a "way they have in the navy"?' "

(Continued on page 303.)

SLAVERY IN MOHAMMEDAN COUNTRIES.

By J. D. LECKIE.

I.

THE very name of slavery is abhorrent to most Britons, who make the proud boast that slaves cannot breathe on British soil. Some of this abhorrence, doubtless, is due to a mistaken idea of slavery, or, at least, of the system of slavery which exists in some countries. No doubt there are, or have been, forms of slavery that are utterly abhorrent, though even in the Southern States of America, the scene of the greatest anti-slavery agitation recorded in history, the condition of the slave generally was not so bad as readers of *Uncle Tom's Cabin* are apt to imagine. Of this the writer speaks from personal knowledge.

In many Mohammedan countries slavery still exists in the old patriarchal form recorded in the Scriptures. Major-General Sir George Younghusband, in his work *Forty Years a Soldier*, mentions the fact that he had met slaves in Africa who assured him that they did not wish to change their condition, and that they even looked down with contempt on salaried menials. The Mohammedan slave regarded himself as a permanent part of his master's household, if not indeed as one of the family. He felt that his master's interests were bound up with his own, while the paid worker was a mere hireling and outsider. Household slavery, of course, is a different thing from agricultural slavery on a large scale, such as was practised in the Southern States; yet even in America, it may be noted, the anti-slavery agitation came, not from the slaves themselves, who were often quite contented with their lot, but mainly from such whites as had no practical knowledge of the system as it existed in the South.

The British have steadily maintained war on the slave trade, and rightly so. But the slave trade and slavery as practised in Mohammedan countries are very different things. In this connection Sir George Younghusband relates a rather amusing story. A British man-of-war had arrived at an Egyptian port with a cargo of rescued slaves on board. In the war against the slave trade prize-money was granted to the sailors for every slave rescued. The result of the capture, however, was rather unexpected. The slave-dealers were in the habit of taking their 'wares' to Cairo, Alexandria, or elsewhere, and disposing of them to the best

advantage; that is to say, in the case of the girls, to the fattest and richest pasha. But when the British intervened and rescued these slaves a complication arose. It was impossible to send them back to the remote interior of Africa where they had been recruited, and it was therefore decided that they should be sent on to their original destination, which was Suez, and that there kind and philanthropic people should be asked to find homes for them, as domestic servants or agricultural labourers. Now, by a curious coincidence, these kind and philanthropic persons proved to be the same rich pashas who formerly could afford to buy the slaves. Piously blessing Allah and the noble British nation, these pashas gratefully offered a happy home, more especially to the best-looking and plumpest females. The free gift of a commodity which formerly had to be bought as a luxury was a bargain dear to the Oriental heart.

II.

That the position of the slave in Mohammedan countries was not necessarily an unhappy one is proved by the fact that many former slaves have risen to the highest positions in the state, including that of Grand Vizier. Even a sultanate is within their grasp. The Sultan Zobeir Rabah, who gave so much trouble to the French in their conquest of Central Africa, took his name from Zobeir Pasha, whose former slave he was. That he adopted the patronymic of his former master seems to denote that the bond of sympathy so often found between the Mohammedan slave and his master existed in this case also. Zobeir Pasha was a man of special ability and a friend of General Gordon, who had a great regard for him. Rabah in 1893 overthrew the Sultan of Bornu, a rich and prosperous African state larger than England. Then in 1897 he fell on the neighbouring state of Baghirmi, and forced the Sultan and the French Resident to flee. He then made war on France, and though at first defeated, raised a fresh army, and for a while waged a successful campaign. It was not until he was killed in battle, in April 1900, that the French were able to overthrow his government.

That slaves in Mohammedan countries were, as a rule, humanely treated can be shown by many examples. The Moors, after they had

been expelled from Spain and Portugal under circumstances which involved great hardships, made war on all Christendom, in which they were joined by their fellow Mohammedans of the Mediterranean. Thus arose the famous depredations of the Barbary corsairs, which lasted for centuries. The Christians captured during these raids were enslaved, but appear to have been, on the whole, well treated. They were not compelled to renounce their religion, but those of them who voluntarily turned Mohammedan were given their freedom and enjoyed certain privileges. These facts are confirmed by the records of slaves which have come down to us. One of these is the famous Spanish author, Cervantes. He was captured by a Barbary corsair, and for five years was held as a slave in Algiers. He was treated indulgently, and spent much of his time in literary work. Even the fact that he several times attempted to escape, and aided others to do so, does not seem to have brought with it any severe punishment. In *Don Quixote* and his other works, Cervantes incidentally alludes to this captivity, and nowhere, so far as the writer is aware, does he complain of harsh treatment as his lot. He ultimately obtained his freedom by ransom. St Vincent de Paul, another victim of the corsairs, was even better treated, his master (in this case a renegade Christian) actually assisting him to escape from the country.

III.

Slavery still exists in those parts of British Africa which are not yet under effective control, but as British influence extends it will gradually disappear. Although Morocco is now a French protectorate, it is said that slaves are still publicly sold in the markets in such parts of the country as have not been effectively occupied by the French.

In Zanzibar, when it became a British protectorate, slavery was a flourishing institution. One of the first acts of the British Government was to urge the Sultan to emancipate the slaves, to which advice he gave a diplomatic approval, but added significantly that 'the Conservative party was very strong in Zanzibar,' and even the Sultan had his limitations. As early as 1873, however—that is, seventeen years before his country became a British protectorate—he had undertaken to suppress the slave trade, of which Zanzibar was an important centre. The legal status of slavery was finally abolished in the protectorate in 1897, though not without complications and complaints in parliament.

The story is told of a Christian slave who, while working in the garden belonging to a rich Moor of the Barbary States, captivated the affections of a Mohammedan lady. On her proposing to marry him, he answered sorrowfully that such a course was impossible, as he already had a wife living in his own country.

Nothing daunted, the fair inamorata explained that such a circumstance was no obstacle, as by Mohammedan law he could marry a second wife, and she was quite willing that, if he regained his liberty, he should divorce and leave her, this procedure being also permissible by Mohammedan usage. Overcome by such forcible arguments, the slave consented to the marriage, and had no reason to regret it. But when, at a later date, he regained his freedom, his thoughts reverted to his distant home and the wife who was still hopefully awaiting his return. His second wife, notwithstanding the agreement entered into at the time of the marriage, offered to accompany him to his distant destination. The two wives met, became great friends, and the double conjugal union lasted till death. All three were buried in the same grave. Such is the story as it is told; it may be true, or it may not, but such a romance could only take place in a Mohammedan country.

As a matter of fact, the position of a Mohammedan slave often corresponds to that of the retainer of a chief in the old feudal times. He was sometimes the trusted employee and confidant of his master, and could rise to a position of responsibility in his service. The tie which united the two was one of common interest. It was the master's duty to provide for his slave and minister to his comforts so long as he performed his duties faithfully, even in illness, infirmity, or old age. What's in a name? is often asked. A great deal, sometimes. Call the Mohammedan 'slave' a retainer, and prejudice vanishes. Call him a slave, and the very name conjures up intolerable associations.

THE SONG OF THE CELTIC EMIGRANT.

THERE'S no time for tarrying,
For tear-flow or sigh,
The wind is up, the wave is strong,
The moon is riding high:
My back is to my father's house,
My boat is in the bay,
And every hour's an iron hand
That's pulling me away.

A clutch of grief is on our hearts,
A seal is on our speech,
A threnody of days gone by
Is poignant each to each;
For I must try one tilt with fate,
And you must linger here,
To tend the hearth and trim the lamp,
And watch the waning year.

Then farewell to broad river
And green girdling plain,
And farewell to the hoary keep
Brow-beaten by the rain:
Where e'er I tread the wide world,
Or sail the restless sea,
My thoughts shall come on wings of love,
And take their rest with thee.

BARBARA ROSS McINTOSH.

KING O' THE MOORS.

By MACDONALD RAE.

I.

TOPPING the crest, and silhouetted against the western sky, the old tower stood solemn and majestic, dominating the far-flung strath, sentinel-fashion. Eastwards, in successive broken leaps, the ridge dropped down, merged with the general level of the uplands; rolled onward, and, rising abruptly skyward, lost itself in a clump of wind-blasted larch-trees. In between swept the moor, gorse-covered, heather-grown, boulder-studded.

Out of a maze of pop-holes, at the junction of the dry-stone dykes, something emerged—something white, brown, long, and sinewy, that moved in short, jerky motions, suggestive of nerves. It was a polecat; not a common every-day member of the tribe, but a super-polecat, acknowledged king of the moors.

From the old rubble-heap in the larch wood, high up on a projecting spur of the range, he had come, because he had got notice to quit—notice in the shape of a steel trap generously baited with rabbit entrails. Being wise in the ways of the wild, he did not stop to argue the pros and cons of fixity of tenure. He just went.

Whether the fact that someone had begun to 'sit up' and take notice of his existence appealed to his vanity, I do not know; but certain it is that the rabbit entrails appealed to his palate—so he took them, chuckling the while.

Moving westward and up-wind, he struck the old turf dyke skirting the wood, and followed it until he came to the fissure in the rock, where the water trickled into the drinking pool. He crossed the mud-ooze in the full glare of the afternoon sun, and paused to listen. This was new territory to him; from this his journey would be in the nature of a prospecting expedition.

He drew himself up to his full height, balancing himself on his hind-legs, and took in every sound. It was then that one saw the justification of his name. The white of his breast and throat stood out boldly against the dark background of rock: the sun caught and held his sleek coat in a mass of shimmering bronze, while his alert and spring-like poise suggested muscular strength of a steely consistency. Twenty-six inches he measured from tip to tip, twenty-six inches of silent, lightning death.

Surely this was a spell of uninterrupted silence—you or I would have said it was; but, to the listener by the pool, the place was teeming with life. He moved two feet, and sat up again; he was taking no chances; he never did. That's why he had been a polecat so long.

His keen, sharp-pointed ears caught and recorded a myriad infinite sounds, which were duly interpreted, analysed, and diagnosed by his subtle brain. These sounds were danger-posts on the highways of the wild. That low, vibrating, continuous noise clearly indicated that the flock was moving down to the lower pastures, and, from the curlews' wild and plaintive call, he deduced the fact that there was some one with the flock. There was no danger immediately above him; of this he was sure, because of that woodpecker he could hear at work amongst those blasted larch-trees. Also, he was keenly aware of some sort of an early insect at work behind that tuft of wire-grass, and those two blue-bottles cutting fantastic figures in the shaft of sunlight. Yes! he was taking it all in, even to his own shadow in the pool.

Ah! what was that? He grew two inches, or at least seemed to; his head turned to one side, and his eyes peered questioningly upwards. Suddenly, there was the sound of wings, and a hen-kestrel swept over the edge of the rock, stalled, flattened out, and dropped right on the spot where the king had been. With the first hint of danger—that woodpecker had abruptly stopped its rat-tat-tat—he was alert, and when a darkening shadow shot between him and the heavens he just went; disappeared as if the earth had swallowed him. Not that the polecat is common prey for a kestrel, but then, you never can tell what a kestrel will do, and the king evidently knew that he would be a polecat much longer if had no arguments with one.

II.

With the night, the king again came into being, emerging from his fastness after a careful analysis of the various scents borne to him by the evening wind. He crossed the ooze to the water, where, perched on a corner of rock, he carefully and elaborately made his toilet, frequently stopping to listen and question the breeze. Finished at last, he loped off through the rough grass into the forest of gorse. The moon, shooting her horns above the fir-belt topping the back range, found him following the sheep-track, crossing and re-crossing, this way and that, seeking, always seeking, goaded by his inherent instinct to kill. He surprised a mole disporting itself in the soft earth around a clump of whins, and promptly fell upon it. Really he had no time for moles, but they were much better dead.

Leaving the track, and turning back in a half-circle, he crossed the overflow of the drinking-pool. Here he collided with a hedgehog, and

there emanated from that little hollow the worst thing in cursing a polecat has ever attempted. The king stood, back up, fur bristling, and fore-paw raised, swearing horribly, while the hedgehog, with disconcerting deliberation, rolled himself into a ball, presenting a formidable array of interwoven spikes, a defence which he knew to be impregnable. Had it been at all possible to accomplish that hedgehog's demise, the king would have found means. But it wasn't possible. With a parting curse he pursued his course up the slope from the stream and through a labyrinth of bracken stems, with the moonbeams bursting fitfully through the intermittent breaks in the green and gold canopy of the overhead foliage. On the outer edge of this miniature forest he introduced himself to a grass-mouse, and left it lying, hind-legs convulsively twitching, for the night-birds to devour.

He picked up a rabbit-run and followed it, down the rocky face of an old stone quarry, and up the ascent on the far side; through a maze of pop-holes in a dense forest of whin, and out again into the moonlight. Then it was that he got mixed up with a rabbit-snare; went heels-o'-er-head, so to speak, and swore on half-a-dozen different keys.

It frequently is the case that, when the unexpected happens, you miss that for which you were really seeking. With the king this was almost the case. He nearly missed, but not quite; the wind told him something—told him that that molehill over there was a rabbit.

It is fairly common knowledge that a snake can throw some magnetic spell over a bird; the weasel tribe is endowed with a like power. The rabbit sat quivering; eyes starting out of their sockets, and terror showing in their liquid depths. It was waiting for the end. The king covered the intervening space in a series of side-long, hunched-up leaps, and got busy. A long-drawn, high-pitched squeal told its own tale to every denizen of the wild within hearing. Again it came, wild and shrill, like the last cry of a lost spirit on that lonely moor. But this time it stopped short, as if severed with a sword. It was the death-knell of Brer Rabbit.

In the fir-plantation, hard by the stubble-field, a cushat cooed to his mate, and, reassured, settled himself to sleep again. A cock-pheasant, in a spruce-tree, split the silence with his noisy alarm, causing a score of black-faced hogs to scurry from under the branches, and a dog-fox to halt in his investigation of a rabbit-warren.

The king stood clear, his white vest dyed a deep crimson, his tongue flicking round his sensitive snout in apparent relish. He surveyed his victim and then the wild, where everything kept gray and still. Then, seemingly imbued with a spirit of bravado—or was it arrogance?—he fell on the rabbit again, and,

with a parting 'worry,' was gone, flitting out into the ghostly moonlight like a nomad of the night.

III.

A rabbit-run led him to the dry-stone dyke, and through he went—but not by the rabbit-run. No—he came out on the farther side *viâ* a drain-pipe! Skirting the edge of the field in the lee of the wall, the king passed through an upright wire net. The scent of sheep was now predominant, for here a flock of black-faces were being 'finished off.' He followed a trail, hard-baked by many cloven feet, that ran towards the feeding-troughs. In the lee of the first he stopped and took his bearings. That sharp, black shadow cutting the softness of the light was the turnip-cutter, and the miniature mountain beyond represented turnips. That was quite in order; it was the scent that puzzled him.

Oil-cake and oats—these were quite obvious to his supersensitive proboscis. But mingling with the familiar smells was something else, which he could not at the moment identify. He moved down six yards and found the scent had become more elusive. Six yards more and it had run out; so he turned back and picked it up again. It was a 'wavy' night breeze; faint, and rather uncertain in its direction, it confused him considerably. Persistence triumphed, however; he discovered, on moving to the right, that the scent improved, became distinctly good, and brought him up in the shadow of another trough. He was getting 'hot' now! Hugging the shadows, he sat up; his long, sensitive whiskers twitching in sympathy with his questioning nose. 'Rat,' he said, and vanished. He was still there, but you could not see him; he had become part of the trough.

Then came the sound—'tick, tick, tick' and 'tap, tap, tap.' Though certainly not loud, to the king, crouching under the boarding, it was magnified tenfold. Moving stealthily this way and that, he analysed sound and scent until he knew just where that rodent was. With wonderful precision he struck. There was a high-pitched, knife-edged squeal, a scratching, scuffling, rough-and-tumble sort of encounter, and a dead, half-grown she-rat was nervously twitching in the bottom of the trough. Like Achilles, the king dragged his victim out into the open and left it lying in the eye of the silent moon.

Only a half-grown she-rat—that was all. Yet already there was some living thing that had sensed another tragedy, had heard that death-knell cut into the heavy stillness. And that thing was Scarred-face, the founder of the rat colony. Nor was it the first time he had heard that call! Now that he heard it again, he got busy; that is, his brain got busy, while his body became part of the turnip-cutter under which he

was sitting. His was a master brain. The subtlety of his cunning was surpassed only by the boldness of his daring. In his own sphere, he was an outstanding, magnificent personality; in short, a veritable Napoleon. Hero of a hundred fights, victor of them all, he was acknowledged to be the biggest thing in the rat-world between the fir-plantation and the gorse-covered uplands. And fight again he must. The polecat must be intercepted before he reached the turnip-heap, because of those young rats ensconced there. Scarred-face must act quickly.

The king flitted into the patch of moonlight ten yards in front and sat up, nose working overtime. Scarred-face's twin orbs became two pin-points of green light, staring into the night like gems in an ebon setting.

The king tried the breeze, looked this way and that, and came on again. Four yards away he stopped to scrutinise the shadows around the legs and framework of the turnip-machine, and stiffened involuntarily. What was that? He had caught the hard, luminous sheen of Scarred-face's eyes, and his every move became one of caution. Creeping off to the right in a half-circle, he reached the upright wire net skirting the turnip heap, and came up behind Scarred-face, getting the pull of the wind. He said 'rat' right away, and became immovable. Scarred-face had faced about, and now each beheld the other, while each waited for the other to show his hand. Scarred-face was only a deeper shadow in a mass of shadows; the king looked like an apparition.

Scarred-face had blundered, and now he knew it. He had let the king get between him and the rat colony. So fight he must. As a patch of cloud drifted across the moon's face, he shifted. The king never saw the movement, but nevertheless he knew that Scarred-face had gone. The scent told him that. Then followed a game of hide-and-seek amongst the shadows, but the polecat kept his advantage. In the end, Scarred-face streaked for it, but had no luck. The king, seeming to divine his intentions, started level, and the climax came when they both tried to get through the same mesh in the wire net at exactly the same moment.

IV.

There was no time lost. Scarred-face came in, low down and quick. With wonderful precision he laid open the king's shoulder and was out again. Back he came with lightning speed, and got home two wicked cuts, just as the king cut a fancy pattern out of what was left of the old warrior's right ear. There was no quarter, absolutely none. Scarred-face fought in the style peculiarly to all rats—charge—slash—break—cut and come again! He put all he knew into it, and at each encounter a streak

of fur was neatly chiselled from some part of the polecat's anatomy.

The king's white frontage showed crimson, but all along he was fighting bull-dog fashion, a silent, strong, give-and-take battle. And so far he had done most of the taking. He had lost quite a bit of fur, but was gradually forcing his opponent back, with eyes skinned for an opening. If the king was an expert at the game, Scarred-face was a master. He feinted, drew back, thrust, and covered up—never leaving a possible opening. Time after time he countered with lightning rapidity, and the effects of his strokes were already manifest.

The white of the king's breast had now practically merged with the deep bronze of his coat, but unflinchingly and untiringly he came on, again and yet again, relentlessly forcing his opponent back, and watching for some false move that would give him his opportunity. And that move came. They were now in the shadow of the turnip-heap, and Scarred-face, slipping the polecat's lead, went back right up against the turnips and overbalanced. The king took him side on; clinched, and held with locked jaws. He had struck too near the shoulder, and not far enough round, but if he could only hang on, the opportunity would surely present itself again.

Scarred-face served up his best tricks; tried everything he knew. He jumped, bucked, doubled, rolled, twisted, and scratched, while the king hung on with closed eyes, and wondered if he could manage. There was nothing between them in the matter of weight, and Scarred-face had the pull as far as experience went. Scarred-face braced himself up for a last desperate effort, and, using a turnip as a purchase for his feet, he 'bucked.' There was a dull thud, and something struck them, almost pounding the lives out of them, while the whole earth seemed to shake. A stream of turnips rolled past, and Scarred-face streaked for home. That one turnip, which was the key to the whole heap, had been dislodged in the *mêlée*, and the others, being piled on the slope, had gone careering downhill. The king also had gone—gone with speed—right back to the pop-hole where we first met him.

V.

Just as the first streaks of day were tinting the rough grass, there came a sound cutting into the deep hush of the moor. 'Caw' it came, far away at first, then nearer. 'Caw' again, now almost overhead, and the black one stalled, banked, and came down in a half spiral beside that rabbit of the night before. He was a raven, foraging early from the larch wood on the far shoulder of the hill. With head to one side he looked askance at the deceased furry one. He had seen rabbits dosed with strychnine before, and was taking no chances. Everything seemed

all right, and possibly the wire snare reassured him, so he started in. Two minutes later his mate joined him in the carving, and for some time there was heard the incessant jab, jab, jab of ebon bills. Then 'Cluck,' said the raven, and was motionless, his eye taking on a grimmer gleam. 'Cluck,' he exclaimed again, and, for no evident reason, went up aloft; his mate trailing after him.

A minute later, the keeper loomed big behind a clump of gorse, and that keeper was trying to ease his feelings by uttering words that are seldom printed. Also, he was thinking.

VI.

The level sun, gleaming full into the mouth of the disused rabbit-warren, woke the king. Here he had spent the night and the greater part of the day in a bed of dry leaves. Now, well-fed and well-rested, he felt fit. A trickle of water at the foot of the bank provided him with means for his toilet; and, thus refreshed, he set off, right westward, into the face of the sinking sun.

Everything was still, save for the incessant chirping of a stone-chatter atop of a burnt whin. The king gambolled in a patch of sunshine in front of a clump of gorse, and struck at an early blue-bottle disporting itself in the warmth. He had no definite object in view; and when, later on, he ran into the sheep-track, he inadvertently followed it, finally branching off on to the rabbit-track leading to his kill of the previous night.

But now the scene was changed. There was another object in the picture, for, beside the frame-work of the rabbit, was a black, helpless, fluttering thing, held in the remorseless grip of a steel vermin trap. It was one of the early morning visitors from the larch wood, who, raven-like, had returned to the spoil, quite oblivious of those traps which Lawson, the keeper, had set, cursing the while.

The king laughed inwardly as he ambled leisurely forward, regarding his latest victim from different angles. Next to the joy of killing was the anticipation thereof! He moved nearer, sideways; hesitated for a moment, then bounded in. They resolved themselves into a veritable ball of fur and feather, a whirling vortex of living demons, which subsided suddenly, for the king, finding his mark, bit deep, clean through the spinal cord, and the raven collapsed, a limp, trembling heap.

At this point, Nemesis descended from the blue in the shape of the raven's mate. He came at speed, and it was a pretty scrimmage while it lasted. A crimson streak was plainly visible on the polecat's front, and for him it was humiliating, to say the least.

The raven retired, dishevelled, to the top of a small, moss-covered whinstone, and remained motionless, feathers still ruffled. He knew his

mate was dead—he had seen death too often; and now he was to gamble with it again. He surveyed the scene. There was the king, and beside him his dead mate; here, just two yards from where he sat, was a patch of ruffled moss and the entrails of a rabbit. In his eye shone his last desperate calculation of chances, and he chuckled inwardly. Then, for no obvious reason, he rose, wheeled slowly round with awkward, flapping wings, and came to earth beside that patch of moss. 'Cluck,' he said, and was silent. Possibly his eye took on a harder gleam.

There he sat, inoffensive enough to look at, but, in reality, deliberately inviting the king to come and get him. And the king came in a series of bounds, and full of purpose. Half way he paused, possibly astonished at the black one's bravado, and approached with caution. He sprang just as the raven shot up aloft. There was a sharp click, and steel trap number two caught and held the 'King of the Moors.' The feathered one had played his trump!

Back to earth the raven came and, from his previous perch atop of the whinstone boulder, watched the murderer of his mate writhe in agony. 'Cluck,' he said, and smoothed his plumage; 'Cluck,' again, and dropped a foot from the king. Motionless he sat for a moment, and the gleam in his eye was razor-edged; then, with half-lifted wings he struck, and his javelin beak went straight through the eye to the brain.

Two nights later, when the moon shone clear, and the hill breeze rustled in the larch-trees topping the range, a polecat, suspended by the nose from the barbed wire on the top of the stone dyke, swayed gently to and fro, while, from the shadows beneath, a rat, large and old, with a battered ear and a scaly tail, gazed wonderingly upward.

A LANDSCAPE.

(As seen from the window of the train from Glasgow to London.)

A HEATHERED hill—
And 'neath, a little stream
Reflecting clouds of blue and gray,
Whilst rippling on its merry way.

A little field—
And on its curvèd length
The plough is turning fragrant earth,
Where soon the corn will have its birth.

A silver shower—
Seems cast upon a furrow
Like fairy coins, by mortals found,
With luck, on famed Tom Tiddler's ground.

We passed—
The coins took instant wings—
A flight of gulls in sunlit sky,
That fluttered down when we'd passed by

ETHEL MARY BORLAND.

LLOYD'S AND LONDON CITY LIFE SIXTY-FIVE YEARS AGO.

By A CLERK OF THE PERIOD.

I.

I SUPPOSE most readers are aware of the fact that Lloyd's is an association in London of merchants, underwriters, and brokers interested in the business of insuring vessels at sea, carried on at the Royal Exchange. It was originally started in a coffee-house in Tower Street, London, kept by one Edward Lloyd, and the earliest notice of it occurs in the *London Gazette* of 18th February 1688, about ten months before the flight of James II. to France. The establishment removed to more commodious business quarters in Lombard Street in 1692, and Mr Edward Lloyd gave another proof of his enterprise and foresight by starting a weekly newspaper giving commercial and shipping news, under the name of *Lloyd's News*, still continued under the name of *Lloyd's List*. With the exception of the *London Gazette*, *Lloyd's List* is the oldest English newspaper. The insurance business also made rapid strides, and its headquarters removed to the Royal Exchange in 1774.

At that time marine insurance policies were usually hand-written, and different wordings were used, which were found occasionally to lead to disputes. In January 1779 the Committee of Lloyd's proposed a general form, which was finally approved by the members. It is of interest to note that with only a few slight alterations the same policy is used to-day, nearly a century and a half afterwards.

II.

I was employed in the later 'fifties of last century as a clerk to an underwriter at Lloyd's, who was also a wealthy India and China merchant. My duties were to attend at Lloyd's daily at 10 A.M., and to make notes of the principal shipping casualties from the books there, and return with these to my employer's office in Broad Street between noon and 1 P.M. Except on very rare occasions this work could usually be got through in half-an-hour, and the rest of the time I occupied in perusing files of the various English papers received there from all parts of the world. I also was able to add considerably to the collection of used postage-stamps which I had commenced when at school. I have often thought since that if I had possessed the slightest idea of the ultimate value used foreign stamps would acquire within a half-century of my frequenting Lloyd's reading-rooms I might be richer to-day by many hundred pounds, had I been able to keep them in good condition for so many years. Triangular Capes, Ceylon pennies, Mauritius, and other countries—

for which I read pounds sterling are sometimes paid by ardent collectors at the present time—I met with every day, and as I was good friends with the door-keepers, who collected the letter covers and waste-paper thrown away by members, I might have enlisted their services to collect for me. But my aims in those days were very humble, being limited to getting only one or two of any sort I had not previously seen, and these I could easily obtain in the reading-rooms for myself.

The rooms at Lloyd's are supposed to be available only to subscribers and members. But at the time I am writing about clerks also had free entry, and I never had my right disputed during the three years I frequented them from 1858 to 1860. During all that time I never saw any one of the female sex in the rooms. Possibly in these days, when Women's Rights seem to be so universally admitted, and we have women barristers and women sitting as jurors and as members of Parliament, it will not be easy to keep them from being underwriters, provided they are able to deposit the necessary security of £10,000 as a guarantee for meeting their engagements, and pay the usual fees.

III.

My employer used to take losses in a very quiet and philosophic manner when they were reported to him. He would sometimes remark, 'If there were no losers there would be no winners.' There was no telegraph to India in my time, and no means of getting news from there in a few hours, as is possible now. I remember one of my notes causing some excitement. It recorded the destruction by fire nine days before of a vessel called (if I remember right) the *Red Gauntlet*. The loss was posted in Lloyd's books right enough, but how the news had arrived so quickly startled everyone.

There is some resemblance between the business of underwriting and that of book-making or laying the odds against horses in a race. A man owning a single ship or steamer could not afford to run it if every voyage had to be undertaken solely at his own risk. Insurance to him is therefore a necessity, as without it he might be ruined if his vessel was wrecked. A racehorse owner similarly might not be able to afford to undergo the heavy cost of training and keeping up a costly establishment if his reward was to consist solely in the money given as a prize if his horse won. The underwriter therefore steps in, and for a small premium safeguards the owner of a vessel against ruin by returning him its value if it should be wrecked;

and he can afford to do so because he insures perhaps a hundred or more vessels, and the law of average comes into force, and they cannot all be casualties. The bookmaker does similar offices for the racehorse owner, and through betting makes it possible for him to obtain something over and above the comparatively small amount of money he would receive if his horse won.

There is this important difference between the two businesses. The premium paid to the underwriter belongs to him, and, whatever happens, is never returned. He pays up the insurance money in event of loss, but the premium remains his own. The bookmaker if he loses by the horse winning gets nothing from the owner he pays. But as only one horse can win a race, he usually manages to indemnify himself by laying against all the other horses in the races. There may be twenty or thirty, so he usually comes out on the right side. In the old days of ready-money bookmaking, now illegal, a backer had to deposit his money beforehand when he made a bet, but this was duly returned intact with the winnings if the horse backed won the race.

Large companies owning a number of steamers do not generally insure them. They open an underwriting account in their own offices, crediting it with what would be the premium, and debiting it in the rare case of a loss with the value of the steamer. It usually happens that this underwriting account turns out a substantial profit yearly, when weather conditions all over the world are received and published daily, and the 'law of storms' has been studied everywhere during the last forty or fifty years by those whose business connects them in any manner with the seas.

IV.

My duties, after taking my reports from Lloyd's to the office, principally consisted in copying letters, or adding up columns of figures in various ledgers. There was always something to do until 5 P.M., when our day was over. Most of us lived some four or five miles from the city, and there were not then so many conveniences for travelling as there are now. I generally went to and fro by omnibus; our office hours were from 9.30 A.M. to 5 P.M. Occasionally, on mail days to India and China, we would be detained a little longer, but this very seldom happened. Copying letters would now be done by typewriters, but they had not been invented in those days. The Exhibition of 1851 in Hyde Park had done something towards stimulating invention. I remember being taken there as a child on three occasions. Steel pens and blotting-paper were used in London in the 'fifties, but they were novelties, and many old people did their writing with quill pens even in 1858. When staying at Boulogne for my holidays I

recollect seeing a clerk in the Post Office using sand to dry what he had just written. I never saw a Sedan chair used in England, but they were still used in Boulogne in 1849, for I remember being conveyed in one with my sister to a children's party in that year.

Perhaps the day of the greatest excitement I ever witnessed in London during my life there as a clerk was the 17th April 1860, when the fight between Tom Sayers and Heenan the 'Benicia Boy,' as he was called, took place at Farnborough, Aldershot. Heenan was a big American, five inches taller than Sayers, and the fight was one for the boxing Championship of England. Sayers was a Sussex man known as the most scientific boxer of the day. He exhibited the utmost bravery in the fight, and towards its conclusion continued it with only one arm against his gigantic antagonist. Ordinary business seemed to be suspended in the City, and groups of men assembled in what were generally the most busy quarters could talk of nothing else than what was going on at Farnborough and the progress made in the fight. It ended by the ropes being cut, which probably saved Sayers's life. Some years afterwards boxing without gloves was put a stop to, and made an offence. Whilst there is no doubt that, as was stated in one of the leading London papers after the fight between Sayers and Heenan, boxers often display in their miserable trade qualities which in higher fields make individuals and nations great, the prize-fights which so often took place during the first half of the nineteenth century in England collected mobs of the lowest scum of our large cities, who attacked and plundered anyone in decent attire who may have taken interest in boxing as a science, and occasionally they proved more than a match for the police. The events of 1914-18 showed that Britons have not suffered in any way in the qualities which go to the making of good soldiers by the fact that prize-fighting with ungloved fists has now been stopped for over a generation in England.

I do not know what remuneration clerks receive at the present time, but it may interest them to know that I was paid £60 yearly salary, which for a lad not yet out of his teens was liberal enough. The hours of work are probably longer now. We left office at 2 P.M. on Saturdays, and were allowed a fortnight's holidays each year. My omnibus fare cost me something like £15 a year, but as I was living with my family, my board and lodging cost me nothing. If I had had to provide for my own 'keep' the salary would have left little for clothes and amusements. Yet it was thought a desirable position for one of so young an age at the time, and there were doubtless many quite as competent clerks receiving even smaller remuneration than I did, who managed to live without the advantages I enjoyed.

JOHN MACNAB: A COMEDY FOR POACHERS.

By JOHN BUCHAN, Author of *John Burnet of Barns*, *Greenmantle*, &c.

CHAPTER IX.—SIR ARCHIE INSTRUCTS HIS COUNTRYMEN.

CROSSBY was right in his forecast. The sudden interest in the Scottish Tutankhamen did not survive the revelation of Harald Blacktooth's reincarnation as John Macnab. The twenty correspondents, after lunching heavily with Mr Bandicott, had been shown the relics of the Viking, and had heard their significance expounded by their host and Professor Babwater; each had duly despatched his story, but before nightfall each was receiving urgent telegrams from his paper clamouring for news not of Harald but of Harald's successor. Crossby's tale of the frustrated attempt on the Glenraden deer had intrigued several million readers—it was the silly season, remember; and his hint of the impending raid on the Strathlarrig salmon had stirred a popular interest vowed to any lawless mystery and any competitive sport. In the doings of John Macnab were blended the splendid uncertainty of a well-matched prize-fight and the delicious obscurity of crime. Next morning the news of John's victory at Strathlarrig was received by the several million readers with an enthusiasm denied to the greater matters of public conduct. John Macnab became a slogan for the newsboy, a flaming legend for bills and headlines, a subject of delighted talk at every breakfast-table. Never had there been a more famous eight-pound salmon since fish first swam in the sea.

It was a cold gray morning when Lamancha and Archie left Crask in the Hispana, bound for the station of Bridge of Gair, fifty miles distant by indifferent hill-roads. Lamancha, who had telegraphed for clothes, was magnificently respectable below his heavy ulster—which was not his usual habit, but a concession to the urgent demand for camouflage. He was also in a bad temper, for his legs were still abominably stiff, and, though in need of at least ten hours' sleep, he had been allowed precisely six. At long last, too, his speech had begun to weigh upon him. 'Shut up, Archie,' he told his host. 'I must collect what's left of my wits, or I'll make an exhibition of myself. You say we get the morning's papers at Bridge of Gair? They may give me a point or two. Lord, it's like one of those beastly mornings when they rake you up at two to climb Mont Blanc, and you wish you had never been born.'

Sir Archie had no inclination to garrulity, for black fear had settled on his soul. In a few hours' time he would be doing what he had never done before, standing before a gaping audience, which was there to be amused and possibly instructed. He had a speech in his pocket, care-

fully fashioned in consultation with Lamancha, but he was miserably conscious that it had no relation to his native wood-notes. What was Hecuba to him, or he to Hecuba? Why on earth had he not chosen to speak about something which touched his interest—farming, for example, on which he held views, or the future of the Air Force—instead of venturing into the unknown deserts of foreign affairs? Well, he had burned his boats and must make the best of it. The great thing was to be sure that the confounded speech had been transferred from paper to his memory.

But as the miles slipped behind him he realised with horror that his memory was playing him false. He could not get the bits to fit in; what he had reeled off so smoothly twenty-four hours ago now came out in idiotic shreds and patches. He felt himself slipping into a worse funk than he had ever known in all his tempestuous days. . . . For a moment he thought of throwing up the sponge. He might engineer a breakdown—it would have to be a bad spill, for the day was yet young—and so deprive Muirtown of the presence of both Lamancha and himself. It was not the thought of the Conservative cause or his own political chances that made him reject this cowardly expedient. Two reasons dissuaded him; one, that though his friends continually prophesied disaster, he had never yet had a smash with his car, and his pride was involved; the other, that such a course would reveal Lamancha's presence in his company too near the suspect neighbourhood, and might expose the secret of John Macnab. . . . No, he had to go through with it, and, conning such wretched fragments of his oratory as he could dig out of his recollection, Sir Archie drove the Hispana over the bleak moorlands till he was looking down on the wide strath of the Gair, with the railway-line scarring the heather, and the hotel chimneys smoking beside a cold blue-gray river. He had glanced now and then at his fellow-orator, whose professional apathy he profoundly envied, since for the last dozen miles Lamancha had been peacefully asleep.

They breakfasted at the hotel, and presently sought the station platform in the quest for papers. They were informed that papers came with the train for which they were waiting, and when the said train arrived, half-an-hour late, and Lamancha according to arrangement had sought a seat in the front while Archie favoured the rear, the latter secured a London evening paper of the previous day and that morning's

Scotsman. The compartment in which he found himself was crowded with sleepy and short-tempered people who had made the night journey from the south. So on a pile of three gun-cases in the corridor Archie sat himself, and gave his attention to the enlightened press of his country.

He rubbed his eyes to make certain that he was not dreaming. For there, in conspicuous print on a prominent page of a respected newspaper, was the name of John Macnab. There was other news, of outrages in Mexico and earthquakes in the Pacific, of the disappearance of a solicitor, and the arrival in London of a cinema star, but all seemed dwarfed and paled by Crossby's story. There was news of Harald Blacktooth, too, and authentic descriptions of the treasure-trove, but this was in an unconsidered corner. Cheek by jowl with the leading article was what clearly most interested the editor out of all the events on the surface of the globe—the renaissance of Harald Blacktooth phoenix-like from his ashes, and the capture of the Strathlarrig salmon.

Archie read the thing confusedly without taking much of it in. Then he turned to the London evening paper. It was a journal which never objected to breaking up its front page for spicy news, and there on the front page was a summary of the Strathlarrig exploit. Moreover, there was a short, hastily-compiled article on the subject, and a number of stimulating notes. John Macnab was becoming a household name, and the gaze of Britain was being centred on his shy personality. . . . The third act in the drama would be played under bright light to a full gallery. . . . Archie's eyes caught the end of the first *Scotsman* leader, which contained a reference to the Muirtown meeting, and a speculation as to what the Secretary of State for the Dominions would say. Archie, too, speculated as to what Lamancha was saying at that moment at the other end of the train.

This new complexity did something to quiet his nerves and take his mind off his approaching ordeal. There was no word in the papers of the coming raid on Haripol—Crossby had had that much sense; but, of course, whatever happened at Haripol would be broadcast through the land. The Claybodys, if they defeated John Macnab, would be famous; ridiculous, if they were beaten; and while the latter fate might be taken with good humour by the Bandicotts, it would be gall and wormwood to a young gentleman with strong notions on the rights and dignities of landed property. It was mathematically certain that Johnson Claybody, as soon as he saw the newspapers, would devote all the powers of a not insignificant mind and the energies of a stubborn temper to the defence of Haripol. That was bad enough, but the correspondents at Strathlarrig were likely to have heard by this time of the third of John

Macnab's wagers, and the attempt might have to be made under their argus-eyed espionage. Altogether, things were beginning to look rather dark for John, and incidentally for Sir Archie.

These morose reflections occupied him till the train stopped at Frew, the ticket-station for Muirtown. Here, according to plan, Sir Archie descended, for he could not arrive at the terminus in Lamancha's company. There was a cold gusty wind from the north-west which promised rain, the sky was overcast, and the sea, half a mile distant across the sand-dunes, was gray and sullen. Sir Archie, having two hours to fill before the official luncheon, resolved to reject the ancient station fly and walk. . . . Once again the shadow of his speech descended on him. He limped along the shore road, trying to see the words as he had written them down, trying especially to get the initial sentence clear for each paragraph, for he believed that if he remembered these the rest would follow. The thing went rather better now. Parts came in a cascade of glibness, and he remembered Lamancha's injunction not to be too dapper or too rapid. The peroration was all right, and so was the exordium; only one passage near the middle seemed to offer a snag. He devoted the rest of his walk exclusively to this passage, till he was assured that he had it by heart.

He reached Muirtown within an hour, and decided to kill time by visiting some of his friends among the shopkeepers. The gunmaker welcomed him cordially and announced his intention of coming to hear him that afternoon. But politics had clearly been ousted from that worthy's head by the newspaper which lay on his counter. 'What about this John Macnab, Sir Erchibald?' he asked.

'What about him? I'm hanged if I know what to think.'

'If Mr Tarras wasn't deid in Africa I would ken fine what to think. The man will likely be a gentleman, and he must be a grand fisher. I ken that bit o' the Larrig, and to get a salmon in it wants a fair demon at the job. Crask is no' three miles away. D'ye hear nothing at Crask?'

It was the same wherever he went. The fishmonger pointed to a fish on his slabs, and observed that it would be about the size of the one taken on Strathlarrig. The bookseller, who knew his customer's simple tastes in letters, regretted that no contemporary novel of his acquaintance promised such entertainment as the drama now being enacted in Wester Ross. Tired of needless lying, Sir Archie forsook the shops and went for a stroll beside the harbour; but even there John Macnab seemed to pursue him. Wherever he saw a man with a paper he knew what he was reading; the people at the street corners were no doubt discussing the same subject—nay, he was sure he heard the very

words spoken as he passed. . . . The sight of a blue poster with his name in large letters reminded him of his duties, and he turned his steps towards the Northern Club.

He was greeted by his host, a bailie of the town—the provost belonged to the enemy camp—and was presented to the other guests. 'This is our candidate for Wester Ross, my lord,' and Archie was introduced to Lamancha, who smiled urbanely and remarked that he had had the pleasure of meeting Sir Archibald Roylance before. The Duke of Angus would not arrive till the hour of meeting, but Colonel Wavertree was there, a dapper red-faced gentleman who had an interest in breweries, and Mr Murdoch of Nova Caledonia—immense, grizzled and bearded, who had left the Lews as a child of three for the climes which had given him fortune. Also there was Lord Claybody, who came forward at once to renew his acquaintance.

'Very glad to see you, Sir Archibald. This is your first big meeting, isn't it? Good luck to you. A straightforward declaration of principles is what we want from our future member, and I've no doubt we'll get it from you. Johnson sent his humblest apologies. He drove me in this morning, but unfortunately a troublesome bit of business took him back at once.'

Sir Archie thought he knew what that business was. He had always rather liked old Claybody, and now that he had leisure to study him the liking was confirmed. There was much of the son's arrogance about the eyes and mouth, but there was humour, too, which was lacking in Johnson, and his voice had a pleasant Midland burr. But he looked horribly competent and wide-awake. One would, thought Sir Archie, if one had made a great fortune oneself, and he concluded that the owner of Haripol was probably a bad man to get up against.

At luncheon they should have talked of the state of the nation and the future of their party; instead they talked of John Macnab. It was to be noted that Lord Claybody did not contribute much to the talk; he pursed his lips when the name was mentioned, and he did not reveal the challenge to Haripol. Patently he shared his son's views on the matter. But the others made no secret of their interest. Colonel Wavertree, who had come in from a neighbouring grouse-moor, was positive that the ruffian's escapades were not over. 'He'll go round the lot of us,' he said, 'and though it costs him fifty pounds a time, I daresay he gets his money's worth. I believe he is paid by the agents to put up the price of Highland places, for if he keeps on it will mean money in the pocket of every sporting tenant, besides the devil of a lot of fun.' Mr Murdoch said it reminded him of the doings of one Pink Jones in Nova Caledonia forty years ago, and told a long and pointless tale of that

hero. As for Lamancha, he requested to be given the whole story, and made a very good show of merriment. 'A parcel of undergraduates, I suppose,' he said.

But the bailie, who gave him the information, was a serious man, and disapproved. 'It will get the countryside a bad name, my lord. It is a challenge to law and order. There's too many Bolsheviks about as it is, without this John Macnab aidin' and abettin' them.'

'Most likely the fellow is a sound Tory,' said Lamancha, but the bailie ventured respectfully to differ. 'If your lordship will forgive me, there's some things too serious for jokin',' he concluded sententiously.

It was a dull luncheon, but to Archie the hours passed like fevered seconds. Agoraphobia had seized him once more, and he felt his tongue dry and his stomach hollow with trepidation. Food did not permit itself to be swallowed, so he contented himself with drinking two whiskeys-and-soda. Towards the close of the meal that wild form of valour which we call desperation was growing in him. He could do nothing more about his infernal speech, and must fling himself on fortune.

As they left the table the bailie claimed him. 'Your agent is here, Sir Archibald. He wanted a word with you before the meeting.'

A lean red-haired man awaited them in the hall. 'Hullo, Mr Brodie. How are you? Glad to see you. Well, what's the drill for this afternoon?'

'It's that I was wantin' to see you about, sir. The arrangement was that you should speak first, then Lord Lamancha, then Colonel Wavertree, and Mr Murdoch to finish off. But Bailie Dorrit thinks Lord Lamancha should open, him bein' a Cabinet Minister, and that you should follow.'

'Right-o, Brodie! I'm game for anything you like. I've been a slack candidate up to now, and I don't profess to know the job like you.' Sir Archie spoke with a jauntiness which made his heart sick, but the agent was impressed.

'Fine, sir. I can see ye're in grand fettle. Ye'll have a remarkable audience. There's been a demand for tickets far beyond the capawcity o' the hall, and I hear of folk comin' from fifty mile round.'

Every word was like a knell to the wretched Archie, but with his spirits in the depths his manner took a ghastly exhilaration. He lit a cigar with shaking fingers, patted Brodie on the back, linked his arm with the bailie's, and in the short walk to the hall chattered like a magpie. So feverish was his behaviour that, as they entered the building by a side door, Lamancha whispered in his ear, 'Steady, old man. For God's sake, keep your head,' and Archie turned on him the face of a lost soul.

(Continued on page 291.)

THE APPLE.

By JAMES T. JOHNSTON.

I.

FROM time to time new and startling theories are propounded regarding some staple article of diet, one of the latest being that the consumption of too much sugar in its various forms is responsible for 'neurasthenia, emotional instability, anger, degeneration, and national decay.' We had hitherto regarded sugar as beneficial to the healthy, and a promoter of muscular power, and had understood that the negroes in sugar-cane regions depended largely upon the juice of the cane for nourishment. Excess in any form is known to be harmful, but the perusal of this latest diatribe is not sufficiently convincing to stop us from sugaring our tea, and enjoying sweetmeats, cakes, and jam as heretofore. A horrid plausibility attends some of the theories which trace our feelings to our food, and it is as humiliating to be convinced that our thoughts and passions are derived from a chemical process as to believe that our noble emotions are not a matter of soul but of stomach.

There is, however, one article upon the beneficial properties of which all authorities appear to agree—namely, the apple. Though such a common fruit, many are not fully aware of the apple's valuable medicinal properties. It is claimed on its behalf that the apple is an excellent brain-food, owing to the amount of phosphoric acid it contains in an easily digestible form; that it excites the action of the liver, promotes sound and healthy sleep, and thoroughly disinfects the mouth, assists the kidney secretion, prevents the formation of stone, obviates indigestion, and is one of the best preventives of diseases of the throat; and last, but not least, it is said, next to the lemon or the orange, to be the best antidote for the thirst and craving of those addicted to the alcohol and opium habits.—This reads like the legend of the wonderful apple of Samarkand in *The Arabian Nights*, the mere smelling of which was a remedy for every human ailment. Its botanical name *malum* (despite the long 'a') is a libel, seeing it is all good. We have a couplet that 'an apple a day keeps the doctor away,' especially when eaten just before going to bed; and the Americans, who have always been great 'boosters' of the fruit, have another jingle:

Are you feeling kinder sick,
Like a rag the chickens pick?
Are you feeling cross and worried?
Wish, almost, you're dead and buried?—
Eat an apple;

which, while not ranking high as poetry, reveals the proper spirit towards the apple. In 1905 the Americans started an 'Apple Week,'

which bids fair to become a national institution, and very amusing are some of the notices that herald its advent—for example, 'Eve viii. 1, Adam viii. 1-2'—and now that Prohibition is in active operation they will doubtless be enlarged upon year by year, though, to judge from the recent increase in tea-drinking in the United States, the inhabitants are trying to drown their dryness in 'the cups that cheer, but not inebriate.' Following this lead, a 'Fruit Week' has been inaugurated in various centres of Great Britain, when a great amount of advertisement is focussed on the health value of fruit, and children are invited to compete for barrels of apples or boxes of oranges. Scotland has taken up the idea with enthusiasm.

II.

Persons who want to work well are advised by a physician to eat apples. It was through eating one (for the 'forbidden fruit' is popularly supposed to have been an apple) that our first parent (on the maternal side) started manual labour. 'I always feel so sorry for Adam and Eve having had no childhood,' wrote one of our human novelists lately; 'I am sure that is where the trouble came in, for all children steal apples, and if they had only been children when they ate the forbidden fruit it would not have been half so hard upon them.' Lovers of *The Pilgrim's Progress* will remember how when Christiana and her children were resting at the inn kept by Gaius, and a dish of apples was served at supper, the lad Matthew asked if they might eat them, 'since they were such by and with which the serpent beguiled our first mother;' and how Gaius replied:

Apples were they with which we were beguiled:
Yet sin, not apples, hath our souls defiled.
Apples forbid, if eat, corrupt the blood;
To eat such, when commanded, does us good.

This fruit, more, perhaps, than any other, has played a part in the affairs of man. Many are the legends connected with it in Mythology, and modern times can boast the parallel traditions of William Tell and William of Cloudesly. Mention of it is fairly frequent in Holy Writ, as where Solomon asked to be comforted with apples. And in the region of science stands pre-eminent the story of Newton's falling apple in his garden at Woodthorpe, which is said to have suggested to him the theory of universal gravitation, that attractive force which causes each body, whatever its size, to draw every other towards it, and which, acting across an interval of 95,000,000 miles, holds the earth as surely in her path as if she were connected with a chain

to the sun, as well as all the other planets in their respective orbits.

The apple has been dangerous to man ever since the days of our first parents, and, almost as long, a token of love. In the Middle Ages, owing, doubtless, to the feudal system with the rights of wardship, and as a consequence the sale of the marriage of heiresses to the highest bidder, marriages between infants were by no means uncommon. Evelyn tells of the union of the Duke of Grafton, aged nine, with Lord Arlington's only daughter, aged four, 'a sweet child if ever there was one,' when the ceremony was performed by the Archbishop of Canterbury; and we read that the younger of the little princes murdered in the Tower was provided with a wife when he was four. There is also the pleasant tale of a boy of three being allured, in the year 1538, by an apple to go to church in his uncle's arms, and being so married; and of a certain James Ballard meeting a damsel in 1565, and being enticed by her with two apples to go to Colne church and marry her.

'Malo me Galatea petit lasciva puella.'

III.

Further, the apple is a vintage fruit, and what more refreshing and wholesome than a draught of cider?

Heaven's sweetest blessing, hail !
Be thou the copious matter of my song,
And thy choice nectar,

sang John Philips two hundred years ago in his eulogistic poem on the red-streak apple; which recalls the tragedy of the 'Micah Rood' apple, a fruit with a spot of red, like blood, in its heart. The story runs that in 1693 a pedlar with jewellery called at the house of a prosperous farmer named Rood, in Franklin, and next day was found murdered under an apple-tree in his orchard. The crime was never brought home to the farmer, but in the following autumn all the fruit on the fatal tree bore inside a red spot called 'Micah Rood's curse.' The farmer died soon after.

How an apple-stall in Hyde Park, kept by one Ann Hicks, grew by cunning small additions into a small house and garden, which she was requested to remove as being an obstruction on one of the routes to the Great Exhibition of 1851, was discussed in Parliament; though now but a matter of history, it furnishes a good example of how private rights are respected in this country. In 1738 some legal curmudgeon failed in his attempt to oust another apple-woman from one of the entrances to Lincoln's Inn, and one is still to be seen with her rosy wares spread out to tempt those passing up and down Chancery Lane. Nothing much in this, perhaps—an ordinary bit of street life; but she is the heir of long generations of apple-women, for we read that as far back as 1531—nearly four centuries

ago—there was a 'wyff' selling at that self-same Tudor gateway.

This country is very much favoured as regards the supply of this health-giving fruit since, in addition to those we grow ourselves, we receive others in a regular cycle from all the orchards of the world, and so are enabled to enjoy it fresh every day of the year. In this connection it is interesting to observe the order of supplies to Covent Garden. In July, near St Swithin's Day, the first English apples arrive, and in a normal season they are available until the following March. From the middle to the end of September early varieties are received from Nova Scotia. A little later, early varieties arrive from the Pacific Coast—California, Oregon, Washington, and British Columbia. These are followed by consignments from Ontario and the eastern States of America—Virginia and New York. Then come the main crops from the Pacific Coast, and supplies from the United States and Canada are available until the middle of April. Then Australia and New Zealand fill the gap before the English fruit again makes its appearance in July.

'EACH MAN MUST CARRY HIS PACK.'

As we trudge through the valleys, or climb o'er the hills

That lie on our life's varied track,
There are bundles for all made of goods and of ills—

And each man must carry his pack.

Stern fate has apportioned—to each is his own—

Let him set him to learn the knack;
And the lesson that e'en without pith or backbone
Each true man must carry his pack.

Let him not then complain to his neighbour, and say,

'Friend! courage and strength do I lack,'

But brace him to march with his load on the way,

For each man must carry his pack.

There are many who wander and light play the fool,

And some who are careless and slack;

But why for their sakes should we break through the rule

That each man must carry his pack?

Let him strive to go gladly and up with the dawn,

Strap his burden tight, tight on his back;

For present and past with one voice spur him on,
Shouting, 'Each man must carry his pack.'

But, alas and alack for those hopelessly maimed,

Swept frail 'mid life's spindrift and wrack;

May we all, though our aid be unsought and unclaimed,

Help each weak one to carry his pack.

MARY M. CURCHOD.

Chambers's Journal

SEVENTH SERIES

THE LITTLE MARE.

By Lieut.-Colonel H. M. DAVSON, C.M.G., D.S.O.

I.

I FIRST saw her out hunting in Tipperary. She was ridden by a gunner, and it was to him that my attention was first directed. His appearance was revolting to the soul. He was minus a cap; his serge jacket must have been one of the original issue; he wore trousers which had worked half-way up to his knees; and his boots were devoid of blacking.

Hounds had checked, and I was making my way to him to utter a word of protest, when the line was picked up again, and my friend went off like a catapult.

There was no doubt that the man could ride. He let the mare rip, certainly, but he sat quite still, and never hustled her at her fences. She needed no help, for she slid over the banks like a cat; and, with an honest, straight-necked fox in front, I regret to say that before we rolled our quarry over in the open the distance between the gunner and me had considerably increased.

I slid off my horse and loosened the girths—for the run had been fast—and then I walked over to him. He was still mounted, contemplating the obsequies like Napoleon surveying the field of Austerlitz.

I was in orthodox hunting kit, but when I asked him where he came from and why he showed himself to the world improperly dressed, he seemed to tumble to the fact that I was an officer, for he poured forth the various excuses which I think some soldiers must learn by heart. He was on leave; he had lost his cap and had written to the Q.M.S., but had not got another yet; his pants were torn, and he had not been able to get them mended, &c.

Then I looked at the mare he rode. She was a mean little thing, not up to much weight (and he must have walked eleven stone), but she was thoroughbred from the tips of her ears to the soles of her little feet. A good shoulder; wonderfully well let down behind; a bright bay, and not a white hair on her. 'You ought to take care of that little mare,' I said as we parted. 'She is not nearly up to your weight, and she has carried you jolly well.' After that he had the grace to get off her. Hounds did little more that day, and I rode home, never expecting to see rider or horse again.

II.

I was engaged in barracks next morning when an orderly arrived to say somebody wished to see me. So I went round to the square, and found a burly farmer on an equally burly horse, followed by my friend of the previous day on the little mare. The farmer began negotiations at once. He said he had heard I had admired the mare yesterday, and had thought perhaps I should like to own her. I thanked him for his thoughtfulness, but said I had all the horses I wanted; and in any case the mare was too small for a hunter and too big for a polo pony.

I will skip the next twenty minutes. Those who have bought horses in Ireland will be able to fill in the gaps. When I had persuaded him that she was only four off, and not five, and that she was really 15 hands, and not 14·2 as he declared, he dropped the polo pony stakes and concentrated on her being 'the sweetest little mare that ever looked through a bridle, and would go all day out hunting and never put a foot wrong.'

I then began to hesitate. I was going to be married, and thought that when in condition she might make a good lady's hunter, and inquired the price. That did it, of course, and in another quarter of an hour I had bought her, and the burly one rode off with a cheque in his pocket. The little mare remained. The gunner walked.

I then began to wonder if I had done wrong, but the cheque was a small one, and I consoled myself with the thought that if the worst came to the worst I could stand the loss of most of it. The vet's opinion, subsequently obtained, was optimistic.

When properly cared for and fed on good English oats she grew out of all recognition, but she also developed certain light-hearted tricks which obliged one to keep one's wits about one, and which were certainly disconcerting to a lady who objected to being half torn out of the saddle by a succession of corkscrew pig jumps.

I hunted her for the remainder of the season, as did my wife and any guest who happened to stay with us, for, so far as carrying a stranger

across Tipperary was concerned, one could trust her with absolute confidence. And then I was ordered to India. I did not want to part with her, and fortunately a brother who had had a day's hunting on her, and who belonged to one of the London Yeomanry regiments, offered to keep her whilst I was away. So she was transferred to London and became a charger.

There was no need to school her, as she seemed to possess a super-equine intelligence as to what was required of her. In due course she took an honourable part in King George's Coronation procession, and then she fell into a decline, and lost condition so much that, after sundry letters, it was suggested that she should either be sold or destroyed. I objected to both proposals, and am very glad I did so. For when, after eighteen months, I returned home and took her into the country, she put on flesh to such an extent that I was chiefly concerned in keeping her in hard condition. She then became my second charger, and was used continuously as charger, hunter, lady's hack, and general pet, and she incidentally won the first prize for hacks at one of the principal horse shows. She was not a very good hunter in England. Timber or a well-cut fence she would always jump, but she hated being scratched, and negotiating a hairy fence on her was ever a moment of discomfort. But she never refused, and never once put me down. I think I can say the same of two other horses which I have owned, but I paid a great deal more for them than I paid for her.

And then the War came. She went out to France in 1914 and returned in 1919, and I rode her regularly from start to finish.

III.

I took two chargers out to the War. They were known locally as the Big Mare and the Little Mare. The Big Mare was wounded three times; the Little Mare went through it untouched—and she had some marvellous escapes. I do not suppose that many horses which went through the War escaped scathless under similar possibilities.

The first escape was in the Château of Reigersburg, outside Ypres, on the morning of the capture of Hooze. There was a three-stall stable in the grounds, and in it were my two chargers and my adjutant's. A shell entered the stable a yard over the Little Mare's head and burst in the corner. The splinters ricocheted round the walls, covered the Big Mare with small pieces of iron, brick, and mortar (we picked thirty-three bits out of her afterwards), and killed the adjutant's horse. The Little Mare was untouched.

The second occasion was after the retreat across the Ancre in 1918, when I had taken up my headquarters in the village of Bresle. It was a pretty sequestered village, built of

wood and plaster, and the farm which I occupied was surrounded by a courtyard which would have delighted the heart of Constable or Morland.

I reserved for myself a room looking into the courtyard, and next to me, in a sort of turnip-house, was the Little Mare. For twenty-four hours all was peace in the village itself, and then it was enfiladed from the north. This seemed to occasion a good deal of turmoil in the only street, and I went out through the old arched gateway to see if I could assist in calming matters. When I returned twenty minutes later I found my room smashed, 'Tom the Cook'—a faithful Scot from Hamilton, whose real name was Simmonds—lying dead inside it; the door of the turnip-house splintered to atoms; my groom, who had been inside, propped against a wall, with a pal applying restoratives, and the Little Mare standing inside unmoved and unhurt.

The next day was slightly worse, and I was obliged to move to the far end of the village, where it was hoped things would be better, and the telephone wires might be trusted to remain connected for more than an hour at a time. This farm also was good and picturesque, and it still had an old Frenchman in it—the only inhabitant who remained—who said he was too old to move. He found later that he wasn't. My mares were put in a stable divided by a lath and plaster partition from a large barn, wherein were horses and men belonging to one of the batteries in action on the ridge in front. At 6 A.M. next morning two complete gun teams and their drivers were destroyed in that barn, and my two mares were led out from the debris with not a mark on them.

Number three was when the wagon lines were near Varennes with an observation balloon overhead. The Boche proceeded to attempt the extermination of this balloon with high explosive. Apparently an enemy gun-layer made a mistake, as one of these shells burst low and beyond the target. The Big Mare received a small splinter in her wither—it is there now—and several other chargers which were picketed about here were injured. The Little Mare, who was standing close beside the Big Mare, was untouched.

The last scene is the courtyard of a farm at a cross-roads, west of Westoutre. Two mares were standing side by side with their heads poking out of loose boxes. A shell burst in the courtyard, causing several casualties and striking the Big Mare in the face, which necessitated a piece of bone as large as a penny being removed from her skull. The Little Mare escaped unhurt.

IV.

And yet, perhaps, the luck was not all on her side. When my division was withdrawn from the Somme battleground in 1916, the

Little Mare was brought up to me to ride back to rest billets near Corbie. I had waited behind to complete the handing over, and then cantered back over the downs. I noticed that she made a curious noise, but tried to think that it was owing to her being out of condition, as she was pig-fat, and I had not ridden her or seen her for over a month. At the first opportunity I had her out and examined her, and then with a sinking heart sent for a veterinary surgeon. The result was as I had feared—broken wind. The vet. was more hopeful than I was. 'She is not very bad,' he said, 'and when she is fit she will be better still. She will last you through this war anyhow.' It will be noticed that in August some of us were still optimistic that the Somme offensive was the beginning of the end.

But the vet. was right. She not only lasted me to the end of the War, which was much farther off than either of us foresaw, but in the interval she won for me a couple of gymkhana races, a tent-pegging competition, and I played her at polo. She had never played polo, but she took to it like a duck to the water. I imagine she considered it an improved form of tent-pegging. Her performance made me regret that she had not originally stood a few inches lower at the wither. I bought her back from government when the end came. I was advised not to do so on account of her infirmity, but I knew what would be her lot if she were sold, and I preferred to see her end her days in England.

But I recognised that as a hunter or a charger her career was finished, so she was turned out to grass and covered by St. Melruan, a Persimmon horse. Again I refused to take advice. She was too old, people said, and in any case, a broken-winded horse never bred. This advice I knew was good, but I ignored it, and in due

course she dropped a filly foal the very image of herself.

Then the end came. She gave very little milk, and milk at that time was impossible to obtain. The result was that the foal did not thrive, and one night she trod on it, and it never recovered. After that the Little Mare's future became a matter of moment. My first idea was to let her end her days in peace in some grassy paddock, but I was still soldiering at the time, and had not one of my own, and I had found since the War that hire of pasture had risen in value, so I hardened my heart and sent word that she was to be destroyed.

So passed one of the most faithful four-footed companions that I have ever owned. Nearly eleven years before my Irish horse-dealer had described her as the 'sweetest little mare that ever looked through a bridle,' and, as far as my experience goes, he was correct. She was never lame and she was never ill, and, except for her period in London, she never lost condition. I have paid four times her price for hunters that I would not have exchanged for her at any time when she was in her prime.

The Big Mare is grazing in a paddock outside my window as I write, but all I have left of the Little Mare is a pair of small polished hoofs that are mounted in my front hall. Dear little hoofs that I used to like to watch flicking out in front of her on the long hacks homeward on a winter evening, or during the interminable journeys over the pavé roads of north-eastern France. When she was gone the words of Whyte Melville came strongly to my mind, and although the fulfilment of his wishes require more imagination than most of us possess, I could only hope that it would be granted to me in life to have human companions as faithful and devoted to me as was the Little Mare.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER IX.—*continued.*

THE Town Hall of Muirtown, having been built originally for the purpose of a drill-hall, was capable of holding inside its ugly walls the better part of two thousand people. This afternoon it was packed to the door, presumably with voters, for the attendants had ruthlessly turned away all juvenile politicians. As Sir Archie took his seat on the platform, while a selection from the Muirtown Brass Band rendered 'Annie Laurie,' he seemed to be looking down as from an aeroplane on a strange unfeatured country. The faces might have been tombstones for all the personality they represented. Some of his friends were there, no doubt, but he could no more have recognised them than he could have picked out the starling which haunted the Crask lawn from a flock seen next day on the hill. The

place swam in a mist, like a corrie viewed in the morning from the hill-tops, and he knew that the mist came out of his own quaking soul. He had heard of stage-fright, but had never dreamed that it could be such a blackness of darkness.

The Duke of Angus was very old, highly respected, and almost wholly witless. He had never been very clever—Disraeli, it was said, had refused him the Thistle on the ground that he would eat it—and of late years his mind had retired into a happy vacuity. As a chairman he was mercifully brief. He told a Scots story, at which he shook with laughter, but the point of which he unfortunately left out; he repeated very loudly the names of the speakers—Sir Archie started at the sound of his own like a scared fawn; in a tone which was almost a

bellow he uttered the words 'Lord Lamancha;' and then he sat down.

Lamancha had the reception which is always accorded to a man whose name is often in the newspapers. Most of the audience had never seen him in the flesh, and human nature is grateful for satisfied curiosity. Presently he had them docile under the spell of his charming voice. He never attempted oratory in the grand style, but he possessed all the lesser accomplishments. He had nothing new to say, but he said the old things with a pleasant sincerity and that simplicity which is the result only of a long-practised art. It was the kind of speech of which he had made hundreds and would make hundreds more; there was nothing in it to lay hold on, but it produced an impression of being at once weighty and spontaneous, flattering to the audience, and a proof of the speaker's easy mastery of his trade. There was a compliment to the duke, a warm tribute to Sir Archie, a bantering profession of shyness on the part of a Borderer speaking north of the Forth. Then by an easy transition he passed to Highland problems—the land, emigration, the ex-service men, and thence to the prime economic needs of Britain since 1918, the relation of these needs to world demands, the necessity of meeting them by using the full assets of an empire which had been a unit in war and should be a unit in peace. There was little to inspire, but little to question; platitudes were so artfully linked together as to give the impression of a rounded and stable creed. Here was one who spoke seriously, responsibly, and yet with optimism; there was character here, said the ordinary man, and yet obviously a mind as well. Even the stern critics on the back benches had no fault to find with a statement from which they could only dissent with respect. None recognised that it was the manner that bewitched them. Lamancha, who on occasion could be profound, was now only vamping. The matter was a mosaic of bits of old speeches and answers to deputations, which he put together cynically with his left hand. But the manner was superb—the perfect production of a fine voice, the cunning emphasis, the sudden halts, the rounded cadences, the calculated hesitations. He sat down after forty minutes amid a tempest of that applause which is the tribute to professional skill and has nothing to do with conviction.

Sir Archie had listened with awe. Knowing now from bitter experience the thorny path of oratory, he was dumbfounded by this spectacle of a perfection of which he had never dreamed. What a fiasco would his halting utterance be in such company! He glanced at the notes in his hand, but could not read them; he strove to remember his opening sentences, and discovered them elusive. Then suddenly he heard his name spoken, and found himself on his feet.

He was scarcely aware of the applause with which he was greeted. All he knew was that every word of his speech had fled from his memory and would never return. The faces below him were a horrid white blur at which he knew he was foolishly grinning. . . . In his pocket was an oration carefully written out. If he were to pluck it forth and try to read it, he knew that he could not make sense of a word, for his eyes had lost the power of sight. . . . Profound inertia seized him; he must do something, but there was a dreadful temptation to do nothing, just to go on grinning, like a man in a nightmare who finds himself in the track of an express train.

Nevertheless, such automata are we, he was speaking. He did not know what he was saying, but as a matter of fact he was repeating the words with which the chairman had introduced him. 'Ladies and gentlemen, we are fortunate in the privilege of having heard so stirring and statesmanlike an address as that which His Majesty's Secretary of State for the Dominions has just delivered. Now we are to hear what our gallant and enterprising friend, the prospective candidate for Wester Ross, has to say to us about the problems which confront the nation.'

He repeated this exordium like a parrot. The audience scented a mild joke and laughed. . . . Then in a twittering falsetto he repeated it again, this time in silence. There was a vague sense that something had gone wrong. He was about to repeat it a third time, and then the crash would have come, and he would have retired gibbering from the field.

The situation was saved by Wattie Lithgow. Seated at the back of the hall, Wattie saw that his master was in deadly peril, and took the only way to save him. He had a voice of immense compass and he used it to the full. 'Speak up, man,' he roared; 'I canna hear a word ye're sayin'.'

There were shouts of 'Order,' and the stewards glared angrily at Wattie, but the trick had been done. Sir Archie's eyes opened, and he saw the audience no longer like turnips in a field, but as living and probably friendly human beings. Above all he saw Wattie's gnarled face and anxious eyes. Suddenly his brain cleared, and, had he desired it, he could have reeled off the speech in his pocket as glibly as he had repeated it in the solitudes of Crask. But he felt that that was no longer appropriate. The situation required a different kind of speech, and he believed he could make it. He would speak direct to Wattie, as he had often lectured him in the Crask smoking-room.

'Ladies and gentlemen,' he said, and his voice had become full and confident, 'your gallant and enterprising friend is not much of a hand at public speaking. I have still my job to learn, and with your help I hope soon to learn it. What I have to say to you this afternoon is the

outcome of my first amateurish study of public questions. You may take it that my views are honest, and my own. I am not a gramophone.'

In this last sentence he lied, for what he said was for the most part not his own; it was the sermon which Janet Raden had preached him the day before in the clear air of the Carnmore tops. Mixed up with it were fragments of old discourses of his own to Wattie, and reflections which had come to him in the last ten years of a variegated life. The manner was staccato, the style was slangy and inelegant, but it was not a lesson learned and recited, but words spoken direct to those into whose eyes he was looking. He had found touch with his audience, and he held their attention in a vice.

It was a strange, inconsequent speech, but it had a curious appeal in it—the appeal of youth and candour and courage. It was philosophy rather than politics, a ragged but arresting philosophy. He began by confessing that the War had left the world in a muddle, a muddle which affected his own mind. The only cure was to be honest with one's self, and to refuse to accept specious nonsense and conventional jargon. He told the story from Andersen of the Emperor's New Suit. 'Our opponents call us Tories,' he said; 'they can call us anything they jolly well please. I am proud to be called a Tory. I understand that the name was first given by Titus Oates to those who disbelieved in his Popish Plot. What we want to-day is Toryism—the courage to give the lie to impudent rogues.'

That was a memory of Leithen's table talk. The rest was all from Janet Raden. He preached the doctrine of challenge; of no privilege without responsibility, of only one right of man—the right to do his duty, of all power and property held on sufferance. These were the thoughts which had been growing in his head since yesterday afternoon. He spoke of the changing face of the land—the Highlands ceasing to be the home of men and becoming the mere raw material of picture post-cards, the old gentry elbowing out and retiring to suburban lodgings with a few trinkets and pictures and the war medals of their dead. It all came of not meeting the challenge. . . . What was Bolshevism but a challenge, perhaps a much-needed challenge, to make certain of the faith that was in a man? He had no patience with the timorous and whining rich. No law could protect them unless they made themselves worth protecting. As a Tory he believed that the old buildings were still sound, but they must be swept and garnished, that the ancient weapons were the best, but they must be kept bright and shining and ready for use. As soon as a cause feared inquiry and the light of day, that cause was doomed. The ostrich, hiding its head in the sand, left its rump a fatal temptation to the boot of the passer-by.

Sir Archie was not always clear, he was often ungrammatical, and he nobly mixed his metaphors, but he held his audience tight. He did more, when at the close of his speech he put his case in the form of an apologue—the apologue of John Macnab. The mention of the name brought laughter and loud cheering. John Macnab, he said, was abroad in the world to-day, like a catfish among a shoal of herrings. He had his defects, no doubt, but he was badly wanted, for he was at bottom a sportsman, and his challenge had to be met. Even if the game went against them the challenged did not wholly lose, for they were stirred out of inaction into life.

No queerer speech was ever made by a candidate on his first public appearance. It had no kind of success with the bailie, nor, it may be presumed, with Lord Claybody; indeed, I doubt if any of the distinguished folk on the platform quite approved of it, except Lamancha. But there was no question of its appeal to the audience, and the applause which had followed Lamancha's peroration was as nothing to that amid which Sir Archie resumed his seat.

At the back of the hall a wild-eyed man sitting near Wattie Lithgow had been vociferous in his plaudits. 'He ca's himsel' a Tory. By God, it's the red flag that he'll be wavin' soon.'

'If you say that again,' said Wattie fiercely, 'I'll smash your heid.'

'Keep your hair on,' was the reply. 'I'm for the young ane whatever he ca's himsel'.'

Archie sat down with his brain in a whirl, for he had tasted the most delirious of joys—the sense of having moved a multitude. He had never felt happier in his life—or, let it be added, more truly amazed. A fiery trial was over, and brilliantly over. He had spoken straightforwardly to his fellow-mortals with ease and acceptance. The faces below him were no longer featureless, but human and friendly and interesting. He did not listen closely to Colonel Wavertree's remarks, which seemed to be mostly about taxation, or the ex-Premier of Nova Caledonia, who was heavily rhetorical and passionately imperial. Modest as he was, he had a pleased consciousness that, though he might have talked a good deal of rot, he had gripped his hearers as not even Lamancha had gripped them. He searched through the hall for faces to recognise. Wattie he saw, savagely content; the colonel, too, who looked flushed and happy; and Junius, and Agatha. But there was no sign of Janet, and his failure to find her threw a dash of cold water on his triumph.

The next step was to compass an inconspicuous departure. Lamancha would be escorted in state to the four-forty-five train, and he must join it at Frew. While 'God save the King' was being sung, Sir Archie escaped by a side-door, followed by an excited agent. 'Man, ye went down tremendous,' Brodie gasped. 'Ye changed your mind—ye told me ye was goin' to deal wi'

foreign policy. Anyway, ye've started fine, and there'll be no gettin' inside the hall the next time ye speak in Muirtown.'

Archie shook him off, picked up a taxi-cab at the station, and drove to Frew. There, after lurking in the waiting-room, he duly entered a third-class carriage in the rear of the south-going train. At six o'clock he emerged on the platform at Bridge of Gair, and waited till the train had gone before he followed Lamancha to the hotel. He found his friend thinking only of Haripol. 'I had a difficult job to get rid of Claybody, and had to tell a lot of lies. Said I was going to stay with Lanerick, and that my man had gone on there with my luggage. We'd better be off, for we've a big day before us to-morrow.'

But as the Hispana started up the road to the pass, Lamancha smiled affectionately on the driver and patted his shoulder. 'I've often called you an idiot, Archie, but I'm bound to say to-day you were an inspired idiot. You may win this seat or not—it doesn't matter—but sooner or later you're going to make a howling success in this silly old game.'

Beyond the pass the skies darkened for rain, and it was in a deluge that the car, a little after eight o'clock, crossed the Bridge of Larrig. Archie had intended to go round by one of the peat-roads, but the wild weather had driven everyone under shelter, and it seemed safe to take the straight road up the hill. Shapp, who had just arrived in the Ford, took charge of the car, and Archie and Lamancha sprinted through the drizzle to the back door.

To their surprise it was locked, and when in reply to their hammering Mrs Lithgow appeared, it was only after repeated questions through the scullery-window that she was convinced of their identity and permitted them to enter. 'We've been sair fashed wi' folk,' was her laconic comment, as she retired hastily to the kitchen after locking the door behind them.

In the smoking-room they found the lamps lit, the windows shuttered, Crossby busy with the newspapers, Palliser-Yeates playing patience, and Leithen, as usual, deep in the works of Sir Walter Scott. 'Well,' was the unanimous question, 'how did it go off?'

'Not so bad,' said Archie. 'Charles was in great form. But what on earth has scared Mrs Lithgow?'

Leithen laid down his book. 'We've had the devil of a time. Our base has been attacked. It looks as if we should have a rearguard action to add to our troubles. We're practically besieged. Two hours ago I was all for burning our ciphers and retiring.'

'Besieged? By whom?'

'By the correspondents. Ever since the early afternoon. I fancy their editors have been prodding them with telegrams. Anyhow, they've

forgotten all about Harald Blacktooth, and are hot on the scent of John Macnab.'

'But what brought them here?'

'Method of elimination, I suppose. Your journalist is a sharp fellow. They argued that John Macnab must have a base near by, and as it wasn't Strathlarrig or Glenraden, it was most likely here. Also, they caught sight of Crossby taking the air, and gave chase. Crossby flung them off—they didn't recognise him—but they had him treed in the stable-loft for three hours.'

'Did they see you?'

'No. Some got into the hall, and some glued their faces to this window, but John was under the table, and I was making myself very small at the back of the sofa. Mrs Lithgow handled them like Napoleon. Said the laird was away and wouldn't be back till midnight, but he'd see them at ten o'clock to-morrow. She had to promise that, for they are determined ruffians. They'd probably still be hanging about the place if it hadn't been for this blessed rain.'

'That's not all,' put in Palliser-Yeates. 'We had a visit from a lunatic. We didn't see him, for Mrs Lithgow lured him indoors and has him shut up in the wine-cellar.'

'Good God! What kind of lunatic?' Sir Archie exclaimed.

'Don't know. Mrs Lithgow was not communicative. She said something about smallpox. Maybe he's a fellow-sufferer looking for Archie's company. Anyhow, he's in the wine-cellar for Wattie to deal with.'

Sir Archie rose and marched from the room, and did not return till the party were seated at a late supper. His air was harassed and his eyes were wild. 'It wasn't the wine-cellar,' he groaned; 'it was the coal-hole. He's upstairs now having a bath and changing into a suit of my clothes. Pretty short in the temper, too, and no wonder. For Heaven's sake, you fellows, stroke him down when he appears. We've got to bank on his being a good chap and tell him everything. It's deuced hard luck. Here am I, just makin' a promisin' start in my public career, and you've gone and locked up the local Medical Officer of Health, who came to inquire into a reputed case of smallpox.'

(Continued on page 307.)

SILENCE.

THERE is a silence deep at dead of night

When through the hushed city slumber creeps
With noiseless footstep, and each lonely light

A feeble vigil o'er the darkness keeps;

When Nature fast is sunk in sweet repose

By field and fold, nor any cries arise

Of bird or beast, not e'en a rustling goes

Through sleeping leaves beneath the sleeping skies.

There is a deeper silence—though the town

Resound with all the turmoil of the day,

Though fertile plain, hill, wood, and rolling down

Awake to vigorous life or careless play:

Such is the silence when one voice is still,

The emptiness no other sound can fill.

G. F. BUCK.

THE FISH MARKET.

By KENNETH ANDREW.

I.

THE scene is the quay-side of a little Cornish seaport, the time 9.15 of a bright January morning. The tide is out and the harbour dry, save for the fresh-water stream of the river running through it.

Standing on the edge of the quay wall, one may see all that is going on aboard the scores of luggers moored, two and three abreast, along its length. These boats have all come in on the tide during the dark hours of the early morning, having been at sea since the previous noon.

Here is one that has not been very lucky; her decks swept and washed, her hatches in place, everything ship-shape, and no one on deck. On the hundred-yard stretch of cemented quay that is dignified with the name of 'market' stand the ten 'mauns' (baskets) that testify to her modest catch, with a member of the crew on guard. She has no right to be moored in her present position, and many comments, more forcible than polite, are made upon the arrogance of her skipper in tying-up against the market quay when there are others with 'boat-loads' of fish, that will now have to be carried over her decks, instead of being hauled up the wall direct. When a fisherman speaks of a boat-load, he is referring to something worth seeing; one thinks of a boat coming into port with her scuppers awash, her decks hidden from stem to stern under a mass of fish and nets. Let us glance at one of these other boats.

She is literally smothered in herrings; her coamings and hatchways have disappeared; to the top of her rail she brims with herrings—and still they are being shaken out. The crew, standing knee-deep in silver fish, pass between them a net which is within measurable distance of having every mesh occupied by a member of the finny tribe. The men have been working thus—with a half-hour interval for breakfast—ever since they arrived at three o'clock, and they will be here until three o'clock comes round again. They are plastered to the very eyes with the fine, clinging scales of the fish; seaboots, oilskin jumpers, hands, faces, beards, and headgear—all are reduced to a uniform shimmering grayness by the adhesive film. On the quay two great piles of the fish, each calculated to contain ten long thousands, which were landed in the cold gray dawn, bear witness to their industry.

At a little distance is another lugger that has been less lucky. Fishing apart from the rest of the fleet, she has had the misfortune, in finding the herrings, to fall foul of the dogfish as well.

Her nets have been cleaned (freed of fish), but remain on deck, and it is possible to see that several are nothing but tattered shreds hanging from the headropes. Opposite her on the quay lies her catch of herrings, and a pile of the sea-scavengers that have wrought such destruction. Their form of body, so well adapted to rapid movement, has a certain grace, but the *ensemble* is repulsive; there is so much that is suggestive of their terrible kinsfolk—the vicious head, the gaping maw on the under side, the skin, harsh and rough as any file.

Farther along the quay, by a low stone building, lie three or four boats that have shaken out their nets and are now engaged in discharging fish. At the top of the harbour wall opposite every boat stand two of her crew. Each holds a four-fathom length of small rope terminating in a blunt iron hook. These are lowered to the boat and adjusted to the handles of a maun; at the word 'Right!' the two men haul together, and there soars into view a couple of hundreds of . . . of . . . of . . . why, yes! of Pilchards! For this is a salting-house, and the few boats have brought home part of a belated shoal of Cornwall's fish that must have been picked up and led astray by the great herring army. Here it is another matter to get covered with scales, for those of the pilchard are almost the size of threepenny pieces, and the coating of his seaboots and upper legs gives each fisherman a grotesque appearance, like some novel satyr of the sea; some comic Triton, man above and fish below.

II.

'Ding! . . . Ding! . . . Dong! . . . Ding-Dong-Ding!' It is time we returned to the market.

The cement pavement is now crowded; little notice is taken of those still so hard at work in the luggers. Everyone sticks his hands in his pockets, or on his hips, and stares earnestly at one of the scores of piles of fish set out for sale.

'Dong! . . . Dong!' Here comes the auctioneer. He is also harbourmaster, and we all know him as 'Alf,' seeing that he is a native of the town, and popular; but his little gold-laced cap must be respected just now, and the 'gen'lemen' must bid up for these fine fish. He halts before the nearest catch, tucks his big hand-bell under his arm, produces a notebook and pencil from nowhere, and the sale is on. . . .

'Four shillin'. . . . Four shillin'. . . . Who'll say five? . . . Five shillin'? . . . Nobody say five?' Alf is pained; he pushes his cap back, glances round, and makes a

modest little speech, eulogistic of the fish in question (those under the hammer are always the best of the catch!); but it is all to little avail—his eloquence produces but one three-penny advance, and the fish are knocked down at four-and-threepence a hundred.

He moves on, and comes to the dogfish we have noticed.

'Lot o' dogs here, gen'lemen. . . . How many? . . . Two hundred? Two hundred dogs here, gen'lemen. Wottami bid for the dogs? . . . Seven . . . eight . . . nine . . . ten. . . . All done?' And again he moves on.

Thus the fish is sold, lot by lot. Sometimes a boat-load as yet only partly discharged is put up and auctioned off at so much per 'cran,' whatever the final total may prove to be; sometimes two hundreds of fish from an unlucky boat are sold to a fish 'jaunter' or 'jouster,' who will carry them off in his donkey-cart to be sold at cottage doors throughout the district; sometimes it is a matter of dozens of ray, ling, or conger, from a boat that has commenced boltering¹ too soon, and thus missed her chance of herrings; sometimes it is a score or two of whiting, picked up by an adventurous longshoreman from an open boat. All payments pass through the harbourmaster's office, where a little something is deducted for expenses and the upkeep of the harbour.

The only fish not put up to auction are the pilchards. These the boats contract with the various curing houses to sell throughout the season at a standard price, which, when fixed at the beginning of that period, is usually greeted by the fishermen with forceful objurgations, and which gradually declines as the season advances.

When the fisherman can sell his catch as it lies on the quay he does not concern himself further in the matter; but if he sells to a dealer by sample, or 'as they lie' in the boat, he is expected not only to bring the fish ashore, but to tip them into boxes, barrels, or baskets, as the case may be, to the satisfaction of the purchaser. This is not, perhaps, very fair, as it entails a lot of extra work and wasted time on the part of the over-tired fisherman, and the dealer always has his own workpeople at hand to look after the receptacles.

III.

Herrings are sold, when scarce, by the hundred of 120 or 123, and the fishermen throw them into the mauns in casts or 'hands' of four; counting aloud up to thirty 'hands,' when the hundred is complete. The extra three per hundred are always conceded, if called for by the dealer, when the fish are a little undersized.

When the catch is a large one it is impossible to count them all out, and the vendor and purchaser agree upon what shall be called a 'cran.'

¹ Long-line fishing.

In Scotland, whence the name comes, a cran is a definite measure of volume, but here, as has been said, it is largely a matter of agreement as to what basket shall be used as a unit. By way of rough indication, it may be said that in this neighbourhood eight hundreds of good average herring are generally accepted as the equivalent of a cran. That is to say, the fish being of a good size, two hundreds are counted into a maun; it is noted how nearly the basket is filled, and subsequent baskets of the same size are filled by ocular judgment to the same level, every fourth maun to pass ashore being counted by the tally-keepers as completing one cran.

Mackerel are sold by the hundred in the same way as herrings; but pilchards are counted in casts of six, with twenty-one casts to the hundred, and sold only by the thousand of ten such hundreds. Ten thousands of any of these fish make one 'last,' and, with good-sized fish, about eight or nine such lasts represent the utmost capacity of the local boats.

Bolter fish are sold, ray by the dozen, and conger, ling, &c., singly, by the dozen, or by weight; but as the whole catch is in these cases laid out on the pavement for inspection, the circumstances are different from those surrounding the purchase of smaller fish by the boat-load or basketful.

It may not be out of place here to notice the fact that when fish of a big catch are shovelled into baskets, the fishermen are invariably generous to their buyer, and will let a thousand fish go for nothing rather than risk being found to have unintentionally given short measure.

Crabs and lobsters do not come into the public market in this district, but are boxed and sent away by their captors. This has arisen out of the fact that when a crabber sold to a dealer in the old days, that dealer claimed an absolute monopoly of the man's catch, and forbade him to sell even one of his crustacea to any other person.

IV.

Now let us take another glance at the market as a whole.

Here is a boat ingeniously fitted with a long, makeshift derrick, by which her people are hoisting their mauns of fish up, across the deck of an intervening lugger, on to the quay, where they are seized by two scaly, oil-skinned figures and carried to a row of barrels, into which they are tipped. As the receptacles become full, the contents are sprinkled with broken ice, and fastened up for transport.

Yonder a dealer, who has bought a thousand of mackerel, is superintending the washing and packing of his purchase into flat boxes. These fish require more care in handling than others, for everyone knows how delicate is the mackerel's flesh; how easily bruised, how ready to decay.

Elsewhere, we find the purchaser of the dogfish, with quite a staff around him, busy with the preparation of these little sharks for the inland market. It is quite a ritual. The first man, armed with a huge butcher's knife, strikes off the sharp fins and their needle-pointed spines; the second man opens the fish and removes the guts; the third stands before an upright post in which is a great sharp hook. He strikes off the tail and cuts the skin across the back behind the eyes; then, jamming the head onto the hook, he grasps the cut edge of the skin and draws off the whole like a glove. The head is then struck off, and the dressed carcass passed to a fourth man to be rinsed and packed. The flesh is regarded as quite a delicacy, though it is not sold as 'dogfish.' (This, however, is one of the little secrets of the fish trade—and, having regard to the unattractive exterior of the fish when alive, it would not, perhaps, be quite fair to disclose here the euphemism under which it reaches the public.)

A little farther on, a man is packing a conger that is longer than himself. He opens and guts the fish (though this is not always done), but leaves the head in place, and the great body is then rinsed in brine. Next comes the problem of the receptacle for such a giant. A stout barrel is produced, and the monster introduced tail first and coiled down, for all the world like a length of some tremendous cable. When he is all in there remains very little room under the lid.

Here is a man dressing ray. He cuts off the 'wings' on either side of the centre line with two dexterous sweeps of his big knife, and casts the whole body of the fish aside as refuse; for from the ray one eats only the flesh of the monstrously-enlarged pectoral fins.

Each of these proceedings is duplicated and multiplied many times. And everywhere is a crowd of idlers who have nothing to do but get in the way (and receive the lusty elbows of hurrying fishermen in consequence), wander aimlessly to and fro, staring at the different sights, slip on the fish-slime and sit down in heaps of offal, trip over mooring-ropes and fall on their undignified noses—behaving, in fact, much as idle crowds do the world over.

In a big seaport, at such a time, the noise on the fish-quay is tremendous, and the continual uproar rises crescendo to fortissimo as each lot is sold; the ululation of the competing buyers being comparable to nothing less than the music of five or six full-sized foghorns as heard when collected in one small room. But this is no more than a small town, and the buyers are inclined to be modest about their bidding—in more ways than one.

v.

This brings one to consideration of the position of these 'Fish-buyers.' It is no secret that

several of the richest of these men began in actual poverty, and have amassed real fortunes from their dealings. The method is simple: having bought or borrowed ten or twenty fish-boxes, the beginner fills them on the fish-quay at very little cost, and has them despatched to what he considers the best market. Salesmen at all the big markets up-country are always ready to deal with any consignment that comes to hand, and the speculator receives in due course a cheque representing the price of his fish at their second sale—a very much better price than he paid the fisherman. This is not invariably the case, of course, for the business, like others, has its risks; but it is a fact that in a very short time this beginner in small things extends his buying and becomes a recognised dealer at the quay-side. Nor is it long before real estate begins to attract his attention, and he commences to lend money to needy members of the fishing community—either to replace lost gear, or to keep their poor homes together in times of ill-fortune.

To amass a fortune from small beginnings is far from being a misdemeanour, but when that fortune is put together with very remarkable rapidity in a business that ought to render only commonplace trading profits, one may be forgiven for looking with some curiosity at the methods of the person concerned.

It is not a pleasing sight to regard the buyers on the fish-quays of these small towns. They have an irritatingly insouciant air, as of men who have no interest whatever in the fish offered to them, and are inclined to protest in injured tones against being dragged from their warm beds so early. And this at 9.30 A.M., before men who have been at work all through the winter night and have had hardly any sleep for a week—men, moreover, who know that some at least of these lordly beings came into the town a few short years past as penniless wagoners or disgraced farm-hands; who have watched them grow sleek and wealthy upon the labour of their betters!

When fish is scarce, matters are more satisfactory, though even then there is frequently cause for comment. It is remarkable how often, when the fleet does well and a number of boats are heavily fished, the luggersmen have to be told that their catches either cannot be expected to make much, or cannot be sold at all, in consequence of a 'glut.'

At such times there are three possible courses open to the fisherman: one is to sell the fish for whatever the compassionate buyers will condescend to give; the second is to set out for another port in the hope of selling to better advantage there—but this is never welcome, in view of the additional strain, distance, time, and possible disappointment; the third is to run the vessel out of the harbour and shovel the tens of thousands of dead fish back into the sea.

Now the townsman who lives miles from the nearest seaport has a right to ask why, when herrings are worth only one-fortieth part of a penny apiece at the quay-side, the poor of his city are still invited to consider themselves lucky in obtaining the same fish at twopence each.

Assuming, even, that he sends the fish 250 miles by rail, the dealer pays four shillings or less per hundredweight carriage.

Is the rest of the 7900 per cent. difference between quay-price and retail price divided in the fish trade?

Why do buyers at the quayside refuse to make a single bid for boat-loads of fish, while in the papers of the day are to be seen references to the failure of the herring season in other parts of the country? Is this done in order to enrich themselves more easily by selling only a limited number of fish at a high price, or is it merely that they are too lazy to pack a large quantity?

An extreme case has here been quoted; a state of things which existed in 1923 and has not recurred in the same town during the past year—possibly because of an angry outburst of public opinion which was provoked by that latest shame. But such things happen almost regularly, at short intervals, and will happen again. Meanwhile, mere talking can do no good, and the remedy is yet to seek.

The whole of the fish trade is redolent of unfair profits. The fishermen get nothing; they remain in poverty from generation to generation, and have no chance to rise, unless they forsake the calling of their forefathers. It is open to anyone who is free of conscience and shame to set up as a fish-buyer and grow fat by the sweat of these hardy harvesters of the sea.

Such is Britain's reward to those who risk their lives to seek her food in the relentless sea!

Those who deal in the nation's food have—and ought to be made to realise that they have—a definite responsibility to the poor of the city slums whom they thus deprive of cheap nourishment; they should be made to realise, too, that ours is a country that does not countenance farcical auction sales which result in one dealer buying in at absurd prices masses of fish which many others share in forwarding to the cities.

VI.

In some places, where patience has been exhausted, and rage at the injustice has conquered fear of boycott, the fishermen have rid themselves of these buyers, and made such arrangements that the fisherman coming in from sea has only to weigh-in his fish and take the weight-ticket, before going to his home, and at the week-end he receives a remittance repre-

senting the sale, less expenses, of his catch, not at the quay-side, but at the inland market.

In some places these arrangements work admirably; in others, such efforts have failed through corruption, incompetence, or the vigorous opposition of the buyers.

Such a step as this, however, only removes one of the screens which are keeping the fisherman's catch from the public and the value thereof from the fisherman.

To effect a total cure of the evil, it would be necessary to reorganise the fish trade entirely; and it is here that the stoutest of Tories might be forgiven for desiring a little mild Communism—not the kind of horror that abolishes the Deity and marriage, but the doctrine that teaches national rights in such things as natural food supplies, and denies the right of one group of men needlessly to starve the poor of their nation in order to enrich themselves.

The facts have been often stated, and the only defences offered by the culprits have been references to the speculative nature of the trade, its expenses in the way of boxes, ice, employees' wages, transport charges, and the like, and, at the other end, a statement that (in effect) the retail fishmonger never dare buy much fish for fear of having it left on his hands.

The value of this last argument is microscopic; but it might be worth while, for the sake of demolishing the excuse, to ask the public to buy more fish, on condition that the fishmonger cut his prices.

Because the supplies of fish fluctuate, and the demand is said to be unstable, John Bull is gulled into paying, very often, many times more than he really need; and while poor mothers pinch and scrape in the slums to keep themselves and their families alive, tons of fresh fish must be thrown into the sea, because, forsooth, 'it is too much for me to handle,' says the buyer, as he stands on the quay with his pipe in his mouth and his hands in his ulster pockets!

SEA-GULLS.

WHITE gulls all heading for the distant sea;
And as I watch their swift unerring flight
Until they vanish from my straining sight,
A sudden craving rises up in me,
A keen insistent longing to be free;
To watch the waves roll in with crests of white,
And hear huge billows break with thund'rous
 might,
Or listen to the sea's low lullaby;
Desire surges like a rising tide
To see those towering cliffs where sea-birds nest,
To stand ere night beside the heaving deep;
Though storm-clouds gather fast on every side,
Would I could follow on the white birds' quest
And feel the salt sea-breeze before I sleep.

FRANCES ALICE MANKS.

THE WINNING OF OO-LAI-YOU.

A TALE OF THE ESKIMO.

By Capt. H. T. MUNN.

I.

NAN-NOOK, nineteen years old, the adopted son of Ak-shadu, stood motionless at a seal breathing-hole awaiting its return. He had stood thus these three hours or more, but his thoughts were far from the business on hand. That morning Ak-shadu had told Kang-oh, In-noto's boy, he would give him slim, pretty Oo-lai-you for his wife after they returned from the bear hunt, and Nan-nook's vague dreams concerning her future had been rudely shattered. Oo-lai-you, quick with her needle, good-tempered, good to look at, slender, straight as a lance, and sixteen years old, had been the boy's playfellow and constant companion; he had looked on her as his future wife, albeit he had flirted and dallied with half-a-dozen others with similar possibilities in view. Nan-nook knew the motive at the back of old Ak-shadu's promise: Kang-oh and his young wife would come to them and build their igloo near by, and hunt and trap for the old man for a year or two, for In-noto his father had other sons and married daughters. To Ak-shadu, Oo-lai-you's attractions were just their value in the marriage market, and he naturally reasoned he had Nan-nook anyway, and that another active worker would be so much to the good for him. Of Nan-nook's or Oo-lai-you's feelings in the matter he gave not a thought, and the girl would not dream of disobeying his wish; parents nearly always arrange their children's matrimonial affairs for them in the Far North—at least amongst the Baffin Land folk.

It surprised Nan-nook to find how much the morning's news had disturbed him. It had never occurred to him before that Oo-lai-you was more important to him than other girls, and his preoccupation was so deep he failed to notice the faint gurgle of water in the hole as the seal approached, and consequently struck too late when it blew, thereby missing it, an altogether unpardonable piece of carelessness for anyone priding himself, as Nan-nook did, on being a good seal-hunter.

As he walked back to the igloo he thought it all over. After all, there were plenty of other girls besides Oo-lai-you; there were Koo-lee-tay and Killo-bar, old Ayou's girls, and Eva-lou, Pannelou's daughter; if he got one of them he would have to work for her father for a year certainly, but this would be no worse than working for Ak-shadu. Nan-nook did not think that Oo-lai-you cared; when they had all lived in the Young People's House last spring, she had pressed noses and dallied with Kang-oh and Panig-pah and the others, just as he had with

Eva-lou and Killo-bar and Koo-lee-tay. When he arrived at the igloo, however, he at once saw Oo-lai-you had been weeping, and asked her, in the old woman's absence, what it was about. She looked curiously at him, and the tears came afresh. 'I don't want Kang-oh for my man; I want you,' she sobbed. Eskimo maidens are quite frank about such matters, but the entry of the old woman put a stop to any further confidences. It was the nearest Oo-lai-you dared go to rebellion. Then all Nan-nook's sensible reflections melted away, and he suddenly felt he had never wanted anything so badly in his whole life as he wanted Oo-lai-you now, and a vague sense of some great injustice swept over him. Had he been a civilised man, Nan-nook would have confessed himself in love; as it was, he found himself amazed at this profound disturbance, and speculated vaguely as to the reason why such a matter should spoil his appetite, a very disquieting event for a healthy Eskimo lad. He puzzled over the problem, thinking of the other girls, and wondering why he did not seem to want one of them at all, till he fell asleep.

II.

So Kang-oh joined Ak-shadu's party, bringing a small sled and four dogs, and they all went off together for the bear hunt, it being understood he was to have Oo-lai-you for his wife when they returned. Ak-shadu carefully stipulated that Kang-oh must stay a year with him, and turn in all his catch of fur during that time. 'That's all he cares about you,' confided Nan-nook to Oo-lai-you bitterly—'just a few fox skins and a bear or so.'

What happened to the party for two or three weeks may be passed over, till we come to the day they followed three bear-tracks far out on the ice as they were shifting camp, and finally came upon them and got them within sight of the moving pack in Davis Straits. They built an igloo, skinned their kill, fed the dogs, and after a prodigious gorge of succulent young bear meat, turned in and slept heavily.

Next morning they found the ice on which they were camped had parted from the land-fast ice during the night and joined the moving pack, a lane of water half a mile wide being between them and safety. Many bold hunters are lost in this way in the Far North.

For the time they were safe enough, the pack of heavy northern ice being all held together in one compact mass many miles wide; but they knew that sooner or later winds and tides might drive it apart, making room for a sea to get up, which would speedily compass their destruction.

Kang-oh did not come out particularly well in the perilous straits in which the party now found themselves, for he sulked in the igloo most of the time. Nan-nook, on the other hand, was indefatigable, travelling far over the terribly rough ice of the pack for seals, and getting a bear on one occasion. On his efforts the party lived for three weeks, moving camp and building fresh igloos as the ice began to threaten to go abroad. Though younger than Kang-oh, Nan-nook took the lead in all the work, consulting with old Ak-shadu as with an equal. The old man took a gloomy view of their chances, and believed they would never see the land again. He began, too, to form a very poor opinion of his future son-in-law, telling his old wife so in private. However, his word was given, and probably they would all die now anyway.

Nan-nook and Oo-lai-you were thus much thrown together, for the two would go away on the dog-sled for long days after seal, and many love passages with much pressing together of noses occurred when the igloo was out of sight. 'You shall be my wife,' Nan-nook would declare; 'in a year or two I will have my own dog team, and then I will steal you from Kang-oh, and we will go to the Ig-lu-luit country together far away.' And she, now despising and hating Kang-oh, would agree to this desperate measure.

III.

A day came when the ice pack started to go abroad, and the party sought refuge on the largest piece of ice likely to hold together, but old Ak-shadu knew only too well that whenever there was room for a sea to get up the end would not be far off.

Wider and wider apart became the ice floes, till the party found themselves huddled on a heavy pan of ice and driving south in a snow-storm, the sea increasing every hour in violence till they were awash. In the few dark hours of the following night, just as the old man had said, 'It is the end; good-bye, wife,' Nan-nook shouted, and there loomed ahead the outline of a gigantic berg with a low spit, against which their pan of ice brought up with a violent jerk that threw them all off their feet. A wild rush was made for the berg, and the sleds—to which the dogs had been kept harnessed for such a contingency—and the whole party were hastily transferred without loss. As Nan-nook, the last to leave, scrambled into safety the floe slowly up-ended, and the next second broke into pieces with the combined pressure of wind, wave, and tide.

At daybreak they saw the berg they had found refuge on was the outer one of a line of stately giants which reached in towards the low land of Kater Head, some twenty-five miles to the westward, where they knew some of their tribe were wintering. The berg was aground—as were the rest—on the Isabella

Bank, a well-known whaling bank for the ships late in the season. Their refuge was a very high berg, except for the low spit on to which they had scrambled, and dangerous as soon as the high spring-tides should come, for it might then turn over and drown or crush them amongst the broken fragments, unless they could leave before the catastrophe happened. They saw, too, that had they been fifty feet more to the seaward they would have missed the spit, and in another three hundred feet have brought up against the 'fast' land-ice—and safety; but now between them and it was the black water, with the swirling tide or current running most of the time from the berg to the land-ice. To the north, about half a mile away, were two huge bergs aground which they had passed unseen in the night, and, as if to shut off all hope of escape, a large field of ice, some miles in extent, had driven against them and brought up, thereby hindering any stray pans of ice from coming down on which they might raft to safety.

Nor was this the worst; with the rise of the tide they felt distinct tremors in the berg on which they were lodged, and the full moon and high March spring-tides were only a few days off. Old Ak-shadu shook his head and said it looked bad.

A small igloo was built, into which they crowded, and the footwear was dried over the blubber lamps.

IV.

By the second morning Nan-nook had made up his mind what he would do. Calling Ak-shadu to one side, he unfolded his plan. He would reach the fast ice by rafting on the two sleds, which he thought would float him if he sat astride. Once there he would get a pan of ice under the two sleds, lash them in place, and in this way the party could raft, one by one, to safety, for with the aid of the seal-lines, sled lash-lines, dog-traces, and whip-lashes—all of strong bearded-seal-line—the raft could be hauled back and forth. Fortunately they had four spare lash-lines of very strong bearded-seal.

Old Ak-shadu nodded. 'It might be done,' he agreed, 'if the sleds will float you and you do not freeze; but you will be in the water to your armpits, and it is very cold.'

'If I try,' said Nan-nook suddenly, 'will you give me Oo-lai-you for my wife? Let the first offer be made to Kang-oh; if he will not go, I will. I do not want Oo-lai-you,' he added thoughtfully, 'if I freeze my feet and cannot hunt any more.'

Kang-oh was called and the proposal made to him, but he would have none of it, promptly agreeing to give up his claim to Oo-lai-you if Nan-nook would attempt the perilous voyage. 'There are other girls,' said Kang-oh philosophically. He was not of the stuff heroes are made of.

The sleds were lashed side by side, the seal-

lines made into two long lines, and a rude paddle contrived. Taking a pair of dry deerskin trousers and a deerskin shirt, and tying them, with a change of footwear and mitts, to his head, and with two of the seal-lines coiled round his neck, Nan-nook essayed the journey. The raft was slipped into the water, Nan-nook sitting on it, with his legs hanging down between the outer runners. The raft sank under Nan-nook's weight till Oo-lai-you cried out; but when his shoulders were just out of the water he found it carried him, and he was pushed off. To keep the submerged raft from turning over took all the boy's care and skill, and it was evident that it would be impossible to raft the women over thus, for only with infinite caution could Nan-nook keep his seat. It was perhaps twenty degrees below zero. Allowing the tide to take him down, Nan-nook used his paddle as a balancing pole, and by the time he reached the fast ice he was all but frozen.

His first act was to strip naked, hastily dry himself with an old shirt he had brought for the purpose, and don his dry deerskin clothes. Two toes, he saw, were frozen, but he left these to luck, and raced up and down for a few minutes till his blood once more began to move. Even then the most painful work had to be done, the getting of the largest pan of ice he could work along the floe edge, and lashing the sleds securely on it. Again and again he froze his fingers working in the icy water, but he stuck manfully to his task, and at last announced to the anxious watchers all was finished. Having secured the spare line to the raft, he gave the signal to haul in, and paid out his line as they did so.

v.

First came the old woman and one child, the woman sitting on the sled with her blanket tied to her shoulders and their few kettles and the child on her knees; it was the utmost the frail raft would carry.

Safely landed, Nan-nook bade her hurry towards the shore, and shouted for Ak-shadu and the other child to come next, which they did. The old man would have stayed to help, but Nan-nook said 'No.' It would be a race for them at the end, he urged, for the great berg was visibly shaking, pieces now and then dropping into the water and causing much commotion. It would certainly shift or turn over on this flood tide—not quite, by the marks on the berg, yet at its height.

As the raft was hauled back for the third time, Nan-nook noticed that the ice-field to the north had broken, and a vast mass of ice was coming swiftly down towards the berg, on which still remained Oo-lai-you and Kang-oh. Self-preservation is the first law of life, and Kang-oh—as has been said—was no hero. The raft would hold only one of them, and to Nan-nook's helpless rage Kang-oh sprang on to

it and pushed it off, leaving the girl standing alone. Nan-nook could do nothing but pull it as swiftly to him as possible. Had he had his rifle he would have shot Kang-oh and told the girl to throw him into the water.

The raft reached the ice and the coward stepped off. Nan-nook, without paying the least attention to him, shouted to Oo-lai-you to haul back quickly. She had placed her own and Nan-nook's blanket and rifle at her feet. The great ice sheet was near now, and it was plain the huge weight and momentum of the impact against the iceberg would convert its unstable equilibrium into a cataclysmal overturn. 'Jump for the raft—jump,' shouted Nan-nook; 'never mind the blankets.' But as the raft approached Oo-lai-you seized a blanket in one hand and the rifle and ammunition bag in the other and sprang lightly on to it, followed by two of the dogs.

Nan-nook hauled the raft towards him as rapidly as he dared, the water washing over the sleds and wetting the kneeling girl in his haste. The tide had been increasing in speed, yet the raft seemed to come more slowly than on any previous journey. If the great berg toppled on the first impact of the ice so swiftly approaching it, and now but a few yards away, Nan-nook knew both he and the girl would meet that most dreaded of all deaths to an Eskimo, drowning, broken-limbed and crushed by the masses of heaving ice amongst which they must inevitably be thrown. Yet it never occurred to him to save himself and let the girl take her chance.

As the raft touched the firm ice, slim Oo-lai-you, pale, but cool and active as a fox, stepped quickly off, and the after end, dipping from the loss of her weight and unchecked by any line from the berg, up-ended and disappeared under the ice on which they stood.

'Run, run,' cried Nan-nook, seizing the precious rifle and ammunition and clasping Oo-lai-you's little hand. At the same instant the ice sheet ground with a crash against the berg as the two sped like deer from the coming cataclysm. The ice sheet instantly overran the low spit with a loud grinding noise, covering it with fantastic masses of moving ice cakes; the next moment, with a roar like a salvo of heavy guns, the great berg toppled, leant, and fell with a deafening crash, churning the water into seething foam and throwing the heavy land-ice along its edge into the air in huge fragments as the wave reached it.

The youngsters raced on, hand in hand, and through both their minds flashed the thought they were yet too close, and doomed to a cruel death. Then they were flung on their faces by the upheaval as the wave passed, the thick ice breaking and surging beneath them like an earthquake. For about one hundred yards from the water the ice was shattered and crashing together in wild confusion—but the two were beyond the zone which would have meant swift

death. Where they were the ice was only broken into large pans, over the rocking surfaces of which they sped lightly to safety.

'I left my blanket behind,' said Oo-lai-you tearfully, now the danger was over. 'You shouted to me to jump, and I hadn't time to pick it up; it is yours I saved.'

'Never mind,' said Nan-nook masterfully, 'it

doesn't matter now. I made a bargain with Ak-shadu and Kang-oh before I tried the raft. From now you and I will only want one blanket between us, and mine was the larger one anyway.' And as they reached the old people, who had been anxiously watching them, they paused and gravely pressed noses together several times as a token of happiness.

THE BEGINNINGS OF 'THE NEW COMMUNICATIONS.'

By J. and S. HARRISON.

Bone and Skin, two millers thin,
Would starve the town or near it;
But be it known to Skin and Bone
That Flesh and Blood can't bear it.

THUS the celebrated Dr Byrom in 1737.

The popularity of this now-forgotten epigram received a fresh lease of life twenty years later, when a great scarcity of food, which people attributed to the avarice of corn-dealers, occurred in Manchester. The injustice of their blame was proved when James Brindley, in the employ of the Duke of Bridgewater, built canals from Worsley to Manchester and from Manchester to Liverpool. These waterways, originally intended to make the transport of the duke's coal easy and expeditious, solved Manchester's transport problems, and caused a reduction in the prices of all kinds of commodities.

The duke was one of the most amazing men who ever sat in the House of Lords. His early life gave no promise whatever of his later achievements. The youngest of a family of consumptives, all of whom died young, he succeeded to the title at the age of twelve after a neglected childhood. At seventeen he went abroad and exhibited a passing interest in the Grand Canal of Languedoc. In Italy he 'did the correct thing' by purchasing several works of art, which remained unpacked until after his death. Returned to England, he led a gay, expensive life, and became engaged to the young widow of the Duke of Hamilton. According to Walpole, this lady had married her late husband 'with a ring of the bed-curtain, half-an-hour after twelve at night.' Her eldest sister, Countess of Coventry, was likewise more fair than prudent, and Bridgewater quarrelled with his intended because she refused his request to desist from further intimacy with her sister, who was the subject of many scandals. The match was broken off, and the duke is said never to have addressed another woman in the language of gallantry.

He retired to his country seat near Worsley, and suddenly exhibited an energy in practical affairs which remained characteristic of him to the end of his life. He conceived a violent antipathy to women, and, indeed, to anything which he considered remotely connected with them. No flowers were grown on his estate, and he planted Turkey oaks in their place. He

neglected his appearance, always ate brown meat in preference to white, smoked heavily, and, in spite of his large patrimony and the immensity of the fortune which eventually came to him through his canals, he refused to countenance the smallest extravagance.

His first thoughts were concerned with the easier transport of coals from his mines. He obtained an Act of Parliament which authorised him to build a canal from Worsley to the river Mersey. In it he bound himself not to exceed the freight of 2s. 6d. per ton on all coals brought from Worsley to Manchester, and not to sell such coal in the latter town at more than 4d. per hundredweight!

On consulting his steward about his project he was advised to call to his aid James Brindley, an unlettered millwright, whose amazing fertility of invention was the theme of general admiration in his own district. The duke was a good judge of character and a man of decision, and he entrusted the young genius with the conduct of the proposed work. Brindley accordingly made what he termed an 'ochilor (ocular) survey or a ricconitring,' and suggested that, rather than carry the canal down to the river Irwell by locks and up again on the other side, as had been proposed, an aqueduct should be built across the river. He was either unaware of, or unperturbed by, the effect of such a proposal on his contemporaries, and it is fortunate that his noble patron was a man of vision and courage. A further Act of Parliament was obtained, and the work was proceeded with in spite of the opinion of an engineer who reported thus: 'I have often heard of castles in the air, but never before saw where any of them were to be erected.'

It is interesting to note that this Barton aqueduct of Brindley's, the first in England, was superseded one hundred and thirty-six years later by the first swing aqueduct in the world. In 1891, during the construction of the Manchester Ship Canal, the Irwell was canalised; and Sir E. Leeder Williams, realising that the Bridgewater aqueduct would interfere with the passage of boats on the new waterway, designed a swing aqueduct, the movable portion of which, without water, weighs 1600 tons. This great

structure now carries the Bridgewater canal over the Ship Canal, and is one of the engineering wonders of the world.

Brindley pushed on with his work, and without the aid of any tradition overcame all difficulties. He cut his canal through Trafford Moss, making his channel watertight by lining it with clay that had been 'puddled,' that is, worked in a manner which rendered it impervious to water.

The canal when opened in 1761 was regarded as a wonder. Strangers 'of the first fashion' flocked from a distance to view the 'river hung in the air.' It cheapened coal in Manchester by half, and contributed to the growth and prosperity of that city.

The Duke of Bridgewater was already making plans for the extension of his canal to Liverpool, which was in those days a comparatively unimportant port, owing to the execrable communications with the rest of England. A new bill was drawn up, but this, unlike the former bills, met with vested opposition. The proprietors of the Mersey and Irwell Navigation tried to save their monopoly by promising all kinds of concessions to His Grace. But His Grace was as unaffected by this as by the political opposition of the Tories against his 'Whiggish proposals.'

Brindley had to come to London to give evidence; and it is recorded that he went to see Garrick in *Richard III*. The performance so upset him that he could do no work for a week, and never again repeated his single experience of a play.

Before the House of Lords he gave his evidence in an unconventional but convincing manner. On being asked to produce a drawing of an intended bridge he said that he would prefer to show a model. He thereupon bought a large cheese and constructed his model from it. He explained the process of 'puddling' clay by practical demonstration, and drew his diagrams in chalk on the floor.

The bill was passed and the new canal proceeded with. In spite of the duke's immense resources he was soon in financial difficulties. He cut down his establishment to a total expenditure of £400 per annum. So far was he in debt that the rector had to waylay him in order to get him to pay tithes, and the duke's agent had to borrow from his tenants so that the weekly wage bill might be met. Brindley's salary at this time was one guinea per week, and the duke never increased this, even when in later years the canals were producing £80,000 per year. Fortunately Messrs Child, the Fleet Street bankers, lent the duke some money on the first canal, which was beginning to bring in a good income, and the new canal was opened to Liverpool in 1767.

Brindley in later years laid out 360 miles of canal for various employers, and died in 1772 in moderately affluent circumstances.

The duke, who by the time he was thirty-six was the owner of the completed canal from Worsley to Liverpool, grew richer, more corpulent, and more eccentric with the advancing years. His industrial undertakings became his hobby. He made an income of £1600 per annum on his own barge service, after an agent had refused to pay £60 per year for the privilege of running it. He constructed a clock which struck thirteen at one o'clock, in order that his workmen should not be able to say that they had failed to hear the single chime when they were late for work. He opened Sunday schools, started a general sick club, and died worth £600,000. A tradition survived at Worsley for many years after his death that the duke rode through the village once a year at midnight, drawn by six coal-black horses.

And yet it is almost impossible to find in the works of his literary contemporaries any reference to the man who was laying the foundations of what Mr H. G. Wells calls 'The Advent of the New Communications.'

A COUNTER-ATTRACTION.

CHAPTER II.—continued.

III.

THEY strolled off along winding paths between high yew hedges to a secluded part of the grounds.

'You know, Rene, I'm very fond of you, and all that, but I don't want to marry you. I would, like a shot, if it wasn't for——'

'And I'd jump at you—if it wasn't for——'

'That's all right, then. We understand one another.'

'Agreed. Who is she?'

'Must I tell you?'

'If you don't, I'll kiss you in front of your mother, and tell her we're engaged!'

'That's hitting below the belt! Very well, then. You remember Rose Maddison—Colonel Maddison's daughter—whom I used to meet at your house, three years ago?'

'Of course I do. Her father died, and we lost sight of her.'

'Well, I've found her. She's behind the counter in father's shop, of all places in the world. But she won't be there long. I don't know how she got there, but I'm going to find out.'

'What does Sir William say about it?'

'Doesn't know. Fact is, there's nothing to tell him. Every time I try to speak to her, she shoves cigar-cases under my nose—I've bought

six—and a slimy shop-walker comes wriggling along. There was nothing settled between us in the old days.'

'Poor boy! I'll see if I can't help.'

'Thanks awfully. Now it's your turn. Who's yours?'

'My what?'

'Your "if it wasn't for——"'

'Impertinence! I sha'n't tell you!'

'If you don't, I'll kiss——'

'Pax, Pax! I'll 'fess up. His name is Leonard Varden, and he's an artist who is bound to be hung soon—I mean his pictures—and meanwhile he gets a living by illustrating advertisements. You've seen that one of the cow jumping over the moon, with a milkmaid hanging on to her tail, waving a condensed milk tin? "Try Luna Brand. It's Heavenly!" Well, that's one of his.'

'Poor girl. I'll see if I can't——'

'Don't chaff. I'm serious.'

'Sorry. We're both in the same boat, it seems, so let's play another set. I want to get the hang of that service of yours.'

IV.

While the last game was in progress, Sir William and his wife sat and watched the ignominious defeat of their son; he was certainly not up to Irene's form.

'Don't you think, dear, that Harry and Irene—it would be most suitable—a most charming girl——' began Lady Rotherton.

'Humph! Let 'em alone, Julia. The boy's only twenty-four. Plenty of time. I was forty when we were married, remember, and you were——'

'I know, dear, I know, rather hastily; 'but the cases are different.'

'Can't say I admire the type. Spindle-shanked ball-chasers. Remember what a little tom-boy she was as a child? She's just the same now, all wire and whip-cord. Now you, my dear, when I first met you at that Charity Bazaar——'

Lady Rotherton smiled, evidently gratified by her husband's admiration of her rather opulent charms, which did not tend to decrease with the passage of years. 'Yes, dear; but it is not ourselves we are talking about. I should feel so much happier if Harry were engaged to some really nice girl—one we could thoroughly approve of. It makes things so *safe*. I thought you might just speak to him——'

'H'm. I'm a money-maker, not a match-maker. However, I have a crow to pluck with the young man myself, so I'll tackle him after dinner. One of our girls——'

'Oh William! Not a shop girl? It's just the sort of thing I was afraid of.'

'It's all right, Ju. Nothing serious. She took a most sensible line. I'll sound him about Irene; don't know that he could do better.'

It was over the post-prandial cigar, after Lady

Rotherton had retired, that Sir William broached the subject.

'Nothing doing, dad,' replied his son. 'Rene and I had it out to-day, and cleared the air.'

'You did, eh? Well, I'm not going to press the matter. Afraid your mother will be disappointed, though.'

For a time there was silence between them, though it was evident to Harry that his father had more to say.

Presently Sir William continued. 'Well, that's that. You are full young yet, and I don't want to interfere with your choice—within limits. But you understand there *are* limits.'

'What do you mean, exactly, father?'

'No good beating about the bush. There's one of our girls—Miss Maddison; you are acquainted, it seems. What do you know about her?'

Harry's face darkened, and set in firm lines that brought out a resemblance to his father that none had seen before. 'I know this much. I'm going to ask her to marry me the first opportunity she gives me.'

'Are you indeed, young man? The opportunity is not likely to occur, as she left for London this morning by her own wish. Very sensible girl.'

'Rose Maddison left? Why? What made her go off in such a hurry?'

'You, apparently. Now, don't be a young fool, Harry. There's nothing to get hot about. I'm not suggesting that there's any low intrigue between you. She's as straight as I hope you are, and I admire the girl. She realised, as you must, that in the circumstances it was an impossible position, and she took the direct way out.'

'Monstrous! Just because a girl is left stranded, and has to earn her living——'

'Steady, my boy, steady! Think of your mother. You are doing well in the service, and with the right wife, and a bit of backing, you will do better. It would ruin your social position if you picked up a wife from behind my counter. Neither your mother nor I could permit it.'

'Social position be hanged! What is it now? Rose is the daughter of Colonel Maddison, and I have yet to find out if the son of a retail shopkeeper is good enough for her. I suppose if she'd sponged on her relations when her father died, she'd still be a "lady" by your wretched code. What awful rot! I'm going to find her, and try my luck, and I'm not going to ask anyone's permission. You are welcome to throw me overboard—and your money too—if you like.' He flung out of the room in a towering rage.

Sir William leaned back in his chair, by no means perturbed by the undutiful behaviour of his son. His faced relaxed, and he chuckled quietly. 'Old "Fire-eater Maddison's" girl, eh? Wonder I didn't spot it when she flared up and told me I was "no gentleman." But who'd have thought—and now Harry reminds me that I'm a "retail shopkeeper"! Well, well.'

(Continued on page 312.)

Chambers's Journal

SEVENTH SERIES

SOME OLD COINS AND THEIR STORY.

By DAVID MACRITCHIE.

IT is wonderful how much history lies latent in an ordinary piece of money that has been in existence for a considerable period. In the immense majority of cases this special value is due to time and circumstance. Sometimes, however, the coin is intended at the outset to be historical; for example, this Portsmouth halfpenny selected from the drawer of a collector. The practical use of the coin is indicated by the legend printed round its edge: 'Portsmouth Halfpenny. Payable at Thos. Sharp's.' But the inscription, which wholly occupies its reverse or under side, records how 'St John Jervis with 15 sail persued & defeated the Spanish Fleet of 27 sail of the line February 14th 1797.' And on the obverse is displayed the figure of Neptune holding his trident in his left hand and, with his right, placing a laurel wreath upon the head of Jervis, who is seated on a rock by the seashore, with Cape St Vincent in the background. The decisive naval victory thus commemorated raised Jervis to the peerage as Earl St Vincent and brought him a pension of £3000 a year.

Beside this witness to the skill and valour of one of our great sea-captains may be placed a small copper-gilt badge, having an anchor depending from a hook, and bearing the inscription 'Howe and the Navy.' This emblem was, of course, made in honour of Jervis's contemporary and brother-admiral, Earl Howe, and of the action off Ushant on 'the glorious first of June'—1794—when he inflicted a crushing defeat upon the French. London was in high jubilation on hearing the news, and celebrated the victory by a brilliant aquatic pageant on the Thames. Probably these badges were sold in great numbers on that occasion; or they may have been distributed among the officers of Howe's fleet.

One of the most striking episodes in the course of the long and stubborn struggle between the British and the allied forces of France and Spain, during the latter part of the eighteenth century, was General George Elliott's determined and successful defence of Gibraltar against the continuous Spanish attack that lasted from June 1779 to February 1783. A reminder of those days, although not actually a memorial, is a little copper coin struck in 1810.

The obverse shows the badge of Gibraltar, a lion holding a large key—the Key of the Straits—in its right paw; the whole surrounded by the words: 'Payable at Robert Keeling & Sons, Gibraltar.' On the reverse side is a strong fortress, having beneath it the date (1810), with the superscription 'Value one quarto.'

The three coins next to be considered represent a great period in British history, for they come from the mint of the East India Company. They are all stamped with the company's armorial bearings: a shield, having St George's Cross on a white ground, with the British Royal Arms placed in the upper corner on the spectator's left, and, as a crest above the shield, a rampant lion holding a crown. (This description makes no attempt at heraldic niceties, but it will be intelligible to all.) The shield is supported on either side by a rampant lion grasping the staff of a St George's Cross flag, and the words on the scroll below the shield are '*Auspicio Regis et Senatus Angliæ*'; these words being given in a contracted form on the coins. Their values are respectively a quarter anna (1835), one pie (1825), and ten cash (1808); with bi-lingual inscriptions, English and Hindu, and English and Arabic. It is curious that the value expressed in 'cash,' a term specially associated with China, has an Arabic and not a Chinese equivalent. The company's sway was so extensive that Chinese and Arabic were both required, not to speak of other languages; for it had 'factories' all over the Orient, from Firando in south-western Japan and Amboyna in the Moluccas westward through China, Farther India, the Eastern Archipelago, India, and Persia, to the Arabian port of Mocha on the Red Sea. The outlying island of St Helena, off the west coast of Africa, was also a possession of the company.

It is astonishing how the East India Company is ignored or minimised by the writers of general British history. Innumerable petty squabbles and intrigues between politicians find chapters, where scarcely a page is devoted to the achievements of this great Asiatic power. Specialists have, of course, given it its due, and one of these (Mr Beckles Willson) rightly describes it at its zenith as 'an Oriental sovereign with absolute dominion over 200,000,000 of

people, having attained an opulence unmatched in the history of Europe, and exerting a rule unequalled since the days of the Cæsars.'

The company possessed a splendid army, with which it waged successful war again and again. A case in point is the Burmese campaign of 1824, when the invading army of 9000 men consisted mainly of the company's troops, but with the valued co-operation of three of the king's regiments. And although the declaration of war was made by Lord Amherst, in name of the king, and although the commander-in-chief, Sir Archibald Campbell (a cadet of the Glenlyon family), was a king's officer, yet the fruit of the campaign was the cession of Western Burmah to the company (not to Britain), and it was the company who financed the whole undertaking, and paid the well-earned pension of £1000 a year to the victorious general. The maritime service was no less important. 'The shipping in the service of the East India Company is such as to constitute a magnificent property and a great naval force,' observed Lord Castlereagh in the course of a speech made in 1803; and he went on to say: 'it is of a nature to be at any time converted into a great addition to the naval forces of the empire; it is composed of upwards of 100 ships, 90,000 tons burthen, and manned by 7000 seamen.' With such an army and marine, the latter containing a large number of effective fighting-ships, and with many other evidences of sovereignty (but always recognising British supremacy), the company might well have a coinage of its own. For what length of time the company's mint exercised its functions is unknown to the present writer. Presumably it ceased to operate on 1st September 1858, when India became for the first time a possession of the British Crown.

The gold pistole and half-pistole minted in Scotland in 1701 seem to be the only numismatic relics of 'The Company of Scotland trading to Africa and the Indies.' It is stated by J. D. Robertson in his *Coinage of Scotland* that 'these coins were struck from gold sent over by the Scottish African Company from the colony of Darien, in a ship called the *Rising Sun*. The Pistole is rare, and its Half very rare.' The obverse bears the laureated head of William II. of Scotland (William of Orange), underneath which is the sun rising from the sea. On the reverse are the British Royal Arms, quartered in the Scottish fashion, according to the practice since the Union of the Crowns in 1603; but with the arms of Nassau superimposed on a small escutcheon. The sea is omitted from the half-pistole, doubtless owing to want of room. It will be seen that these coins were not minted by the Scottish company. The gloomy history of that company is fairly well known. It was created under a charter by William of Orange, acting as King of Scotland, and by an Act of Incorporation passed by

the Parliament of Scotland on 26th June 1695. It was thus constituted *Auspicio Regis et Senatus Scotiæ*. In his history of the English East India Company Mr Beckles Willson says: 'The fear of a new rival in this Scottish company and of its interference in the East India trade was ostensibly strengthened by the ample privileges with which the Parliament of Scotland had vested it, in all respects greater than the London company had acquired in the successive letters patent which they had enjoyed for nearly a century.' To enter into the causes of the decay of the Scottish company would be out of place here. It is enough to note that one result of its demise (about the year 1706) was that the enterprising youth of Scotland were thenceforth obliged to avail themselves of the opportunities offered by the English company; and this they steadily did throughout the eighteenth century; as officers in the company's army and marine, as factors and writers in its civil service, and as 'free merchants' and planters in its dominions. To such an extent was this the case that Mr Willson relates how, in a discussion in the British Parliament in 1813, on the question of the appointment of missionaries in India, one member 'pointed out that the majority of British residents in Hindustan were Scotchmen and Presbyterians.'

Turning from these more historical matters to domestic affairs, we find much that is interesting in the study of the numerous pennies and halfpennies issued in the British Isles by towns and by business firms. They are generally spoken of as 'tradesman's tokens,' and they had presumably a limited circulation, as the firm issuing them might, in at least some cases, be unknown to fame. One very enterprising bookseller in London, James Lackington by name, certainly did his best to avert this calamity, for the reverse side of his halfpenny shows an angel blowing the trumpet of fame and holding in his left hand a laurel wreath, destined, no doubt, for the head of the bookseller himself. Encircling the angel is the prominent legend: 'Halfpenny of Lackington, Allen & Co., Cheapest Bookseller in the World.' On the obverse is the bookseller's portrait, with the date, 1795, and the words, 'J. Lackington, Finsbury Square.' That the portrait is a good one may be seen by comparing it with the contemporary engraving by Ridley, after Keenan, prefixed to Lackington's *Memoirs*, 1795. This book reveals the eccentric character of the man on every page, but that he understood how to succeed may be inferred from the statement beneath his engraved portrait: 'J. Lackington; Who a few years since began business with five Pounds now sells one hundred Thousand Volumes Yearly.' A casual customer, perhaps a little too ready to take Lackington at his own valuation, has left on record this description

of the shop as it appeared to him in 1795: 'Direct our course to Finsbury Square and Lackington's Temple of the Muses. This the largest stationery shop in the world. A rotundo with five stories of books, rising one above another by five flights of stairs, the cupola lighted from the top. From this rotundo rooms extend on each side, with different assortments of books, and different offices for different purposes. The building itself is like a palace. The cheapest books here in Europe.' It is clear that Master Lackington understood the art of advertising as well as anybody in the twentieth century.

A touch of poetry is afforded by the Coventry halfpenny, with its picture of the Lady Godiva riding through the town, 'clothed on with chastity,' to free her people from a tax too heavy to be borne. There is scarcely one of these tokens that has not some interesting feature. The token of the Burntisland Vitriol Company of 1797 invites inquiry. It makes no profession of being of any money value, although in size and weight it is exactly like other tokens that are avowedly halfpennies. Its obverse shows a chemist's flask or still, flanked by a rose and a thistle, above these being the cypher B.V.C^o. From the fact that

the company's home was in Fife, and also because the reverse bears the motto 'Nemo Me Impune Lacessit,' one would suppose that it was exclusively Scottish in its relations; but the presence of the rose seems to hint at a large body of English shareholders.

To the local historian these coins or tokens are of real value, and serve to recall and throw light upon some half-forgotten fact. And they cover a wide field. The harp on some of them denotes Ireland, and the three legs of the Isle of Man are conspicuous on others. Anglesea pennies and halfpennies were apparently much in vogue in the latter part of the eighteenth century, adaptable to different companies as to the reverse side, but always with the Druid's head emblem on the obverse. Then there is the North Wales halfpenny, showing Britannia seated very much in the same attitude as on our modern halfpennies, but holding a plant (*not* a leek) in her right hand. To be compared with it is a Dublin halfpenny with a seated female holding a harp, the penny of this mint having the addition of a spade and pickaxe below. The edge of this coin proclaims that it is 'payable in Dublin or Ballymurtagh'—the latter a small town at the meeting of the waters in the beautiful Vale of Avoca.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER X.—IN WHICH CRIME IS ADDED TO CRIME.

BY the mercy of Providence Dr Kello fulfilled Archie's definition of a 'good chap.' He was a sandy-haired young man from Dundee, who had been in the Air Force, and on his native dialect had grafted the intricate slang of that service. Archie had found him half-choked with coal-dust and wrath, and abject apologies had scarcely mollified him. But a hot bath and his host's insistence that he should spend the night at Crask—Dr Kello knew very well that at the inn he would get no more than a sofa—had worked a miracle, and Dr Kello appeared at the supper-table prepared to forgive and forget. He was a little awed by the company in which he found himself, and nervously murmured, 'Pleased to meet ye,' in response to the various introductions. A good meal and Archie's *Veuve Clicquot* put him into humour with himself, and at ease with his surroundings. He exchanged War reminiscences, and told stories of his professional life—'You wouldn't believe, I tell ye, what queer folk the Highlanders are'—and when later in the evening Archie, speaking as to a brother airman, made a clean breast of the John Macnab affair, he received the confession with obstreperous hilarity. 'It's the best stunt I ever heard tell of,' he roared, slapping his knee. 'You may depend on me to back you up, too. Is it

the journalists that's worrying ye? You leave the merchants to me. I'll shut their mouths for them. Ten o'clock to-morrow, is it? Well, I'll be there with a face as long as my arm, and I'll guarantee to send them down the hill like a kirk emptying.'

All night it rained in buckets, and the Friday morning broke with the same pitiless deluge. Lamancha came down to breakfast in a suit of clothes which would have been refused by a self-respecting tramp, but which, as a matter of fact, had been his stalking outfit for a dozen years. The Merklands were not a dressy family. He studied the barograph, where the needle was moving ominously downward, and considered the dissolving skies and the mist which rose like a wall beyond the terrace. 'It's no good,' he told his host. 'You might as well try to stalk Haripol in a snow blizzard. To-day must be washed out, and that leaves us only to-morrow. We'll have to roost indoors, and we're terribly at the mercy of that hive of correspondents.'

The hive came at ten, a waterproofed army defying the weather in the cause of duty. But in front of the door they were met by Dr Kello, with a portentous face. 'Good morning, boys,' he said. 'Sir Archibald Roylance asked me to see you on his behalf. My name's Kello—I'm Medical Officer of Health for this part of the

world. I'm very sorry, but ye can't see Sir Archibald this morning. In fact, I want ye to go away, and not come near the place at all.'

He was promptly asked for his reason.

'The fact is that a suspected case of smallpox has been reported from Crask. That's why I'm here. I say "suspected," for in my own opinion it's nothing of the kind. But I'm bound to take every precaution, and for your own sakes I can't let a man Jack of ye a step nearer.'

The news was received in silence, and added to the depression of the dripping weather. A question was asked.

'No, it's not Sir Archibald. He's as disappointed as you are at not being able to welcome ye. He says if ye come back in forty-eight hours—that's the time when I hope to give the place a clean bill of health—he would like to stand ye drinks and have a crack with ye.'

Five minutes later the doctor returned to the smoking-room. 'They're off like good laddies, and I don't think they'll trouble ye for the next two days. Gosh! They're as feared of infectious diseases as a Highlander. I'll give them a wee while to go down the hill, and then I'll start off home on my motor-bike. I'm very much obliged to you gentlemen for your good entertainment. . . . Ye may be sure I'll hold my tongue about the confidence ye've honoured me with. Not a cheep from me! But I can tell ye I'll be keeping my ears open for word of John Macnab. Good luck to ye, gentlemen!'

The departure of Dr Kello was followed by the appearance of Wattie Lithgow, accompanied by Benjie, whose waterproof cape of ceremony had now its uses.

'I've got bad news from this laddie,' said the former, lugging Benjie forward by the ear. 'He was at Haripol early this morning, and a' the folk there was speakin' about it. Macnicol tell't him—'

'No, he didna,' put in Benjie. 'Macnicol's ower proud to speak to me. I heard it frae the men in the bothy, and frae ane o' the lassies up at the big hoose.'

'Weel, what a'body kens is maistly true. Ye'll no' guess what yon auld Claybody is daein'. Ye ken he's a contractor, forbye ither things, and he's got the contrack for makkin' the big dam at Kinlochbuie. There's maybe a thousand navvies workin' there, and he's bringin' ower a squad o' them—Benjie says mair nor a hundred—to guaird the forest.'

'Ass!' exclaimed Palliser-Yeates. 'He'll drive every beast into Caithness.'

'Na, na. Macnicol is no entirely wantin' in sense. The navvies will no' be allowed inside the forest. They'll be a guaird outside. What's that they ca' it?—an outer barrage. Macnicol will see that a' the deer are in the Sanctuary, and in this kind o' weather it will no' be that deeficult. But it will be verra deeficult for his

lordship to get inside the forest, and it will be verra near an imposseibility to get a beast out.'

Archie looked round the room. 'Dashed unsportin' I call it. I bet it's the young un's idea.'

'Look here, Charles,' said Leithen, 'isn't it about time to consider whether you shouldn't cry off this Haripol affair? It was different at the start. John and I had a fair sporting chance. Our jobs were steep enough, but yours is absolutely perpendicular. . . . The Claybodys are not taking any chances, and a hundred able-bodied navvies is a different-sized proposition to a few gillies. The confounded Press has blazoned the thing so wide that if you're caught you'll be a laughing-stock to the whole civilised world. Don't you see that you simply can't afford to lose, any more than the Claybodys? Then to put the lid on it, our base is under a perpetual threat from these newspaper fellows. I'd rather have all Scotland Yard after me than the Press.—You agree, Crossby? I'm inclined to think that John Macnab has done enough *pour chauffer la gloire*. It's insanity to go on.'

Lamancha shook his head. 'It's all very well for you—you won. I tell you frankly that nothing on earth will prevent me from having a try at Haripol. All you say is perfectly true, but I don't choose to listen to it. This news of Wattie's only makes me more determined.'

Leithen subsided into his book, observing, 'I suppose that is because you're a great man. You're a sober enough fellow at most times, but you're able now and then to fling your hat over the moon. You can damn the consequences, which I suppose is one of the tests of greatness. John and I can't, but we admire you, and we'll bail you out.'

It was Sir Archie, oddly enough, who now abetted Lamancha's obstinacy. 'I grant you the odds are stiff,' he declared, 'but that only means that we must find some way to shorten them. Nothing's impossible after yesterday. There was I gibbering with terror, and not a notion in my head, and yet I got on fairly well. Didn't I, Wattie?'

'Ye made a grand speech, Sir Erchie. There was some said it was the best speech they ever heard in a' their days. There was one man said ye was haverin', but,' fiercely, 'he didna say it twice.'

'We've the whole day to make a plan,' Archie went on. 'Hang it all, there must be some way to dish the Claybodys. We've got a pretty good notion of the lie of the land, and Wattie's a perfect Red Indian at getting up to deer. We muster four and a half able-bodied men, counting me as half. And there's Benjie.—Benjie, you're a demon at strategy. Have you anything to say?'

'Ay,' said Benjie, 'I've a plan. But ye're ower particular here, and maybe ye wadna like

it.' This with a dark glance at Palliser-Yeates, who was leaving the room to get more tobacco.

'We'll have it all the same. Let's sit down to business. Stick the ordnance map on that table, Charles; and you, Ned, shut that book and give us the benefit of your powerful mind.'

Leithen rose, yawning. 'I've left my pipe in the dining-room. Wait a moment till I fetch it.'

Now Dr Kello on his departure had left the front door of the house open, and the steady downpour of rain blanketed all sounds from outside. So it came to pass that when Archie's quick ear caught the noise of footsteps on the gravel and he bounded into the hall he was confronted with the spectacle of Colonel Raden and his daughters already across the doorstep. Moreover, as luck would have it, at the same moment Leithen from the dining-room and Palliser-Yeates from his bedroom converged on the same point.

'Hullo, Roylance,' the colonel cried. 'This is a heathenish hour for a visit, but we had to have some exercise, and my daughters wanted to come up and congratulate you on your performance yesterday. A magnificent speech, sir! Uncommon good sense! What I——'

But the colonel stopped short in mystification at the behaviour of his daughters, who were staring with wide eyes at two unknown figures who stood shamefacedly behind Sir Archie. This last, having no alternative, was trying to carry off things with a high hand.

'Let me introduce,' he was proclaiming. 'Sir Edward Leithen, Mr Palliser-Yeates—Miss Raden, Miss Janet Raden, Colonel——'

But he was unheeded. Agatha was looking at Leithen, and Janet at Palliser-Yeates, and simultaneously the two ejaculated, 'John Macnab!'

Archie saw that all was up. Shouting for Mrs Lithgow, he helped his visitors to get out of their mackintoshes, and ordered his house-keeper to have these garments dried. Then he ushered them into the smoking-room, where were Lamancha and Crossby and Benjie and a good peat fire. Wattie, at the first sound of voices, had discreetly retired.

'Come along, colonel, I'll explain. Very glad to see you—have that arm-chair. . . . What about dry stockings . . . ?'

But his hospitable bustle was unheeded. The colonel, hopelessly at sea, was bowing to a tall man who in profound embarrassment was clearing books and papers out of chairs.

'Yes, that's Lord Lamancha. You heard him yesterday. Charles, this is Colonel Raden, and Miss Agatha and Miss Janet. That is Mr Crossby, the eminent journalist. That child is Fish Benjie, whom I believe you know. . . . Sit down, please, all of you. We're caught out, and are goin' to confess. Behold the lair of John Macnab.'

Colonel Raden was recovering himself. 'I read in the papers,' he said, 'that John Macnab is the reincarnation of Harald Blacktooth, in which case we are related. With which of these gentlemen have I the honour to claim kin?'

The words, the tone, convinced Sir Archie that the danger was past, and his nervousness fled. 'Properly speakin', you've found three new relatives. There they are. Not bad fellows; though they've been givin' me a rotten time. Now I retire—shoes off, feet fired, and turned out to grass. Ned, you've a professional gift of exposition. Fire away, and tell the whole story.'

Sir Edward Leithen obeyed, and it may be said that the tale lost nothing in his telling. He described the case of three gentlemen, not wholly useless to their country, who had suddenly fallen into *ennui*. He told of a cure, now perfected, but of a challenge not yet complete. 'I've been trying to persuade Lord Lamancha to drop the thing,' he said, 'but the Claybodys have put his back up, and I'm not sure that I blame him. It didn't matter about you or Bandicott, for you took it like sportsmen, and we should have felt no disgrace in being beaten by you. But Claybody is different.'

'By Gad, sir, you are right!' the colonel shouted, rising to his feet and striding about the room. 'He and his damned navvies are an insult to every gentleman in the Highlands. They're enough to make Harald Blacktooth rise from the dead. I should never think anything of Lord Lamancha again—and I've thought a devilish lot of him up to now—if he took this lying down. Do you know, sir,' turning to Lamancha, 'that I served in the Scots Guards with your father—we called them the Scots Fusiliers Guards in those days—and I am not going to fail his son.'

Sir Edward Leithen was a philosopher, with an acute sense of the ironies of life, and as he reflected that here was a laird, a Tory, and a strict preserver of game working himself into a passion over the moral rights of the poacher, he suddenly relapsed into helpless mirth. Colonel Raden regarded him sternly and uncomprehendingly, but Janet smiled, for she, too, had an eye for comedy.

'I'm tremendously grateful to you,' Lamancha said. 'You know more about stalking than all of us put together, and we want your advice.'

'Janet,' commanded her parent, 'you have the best brain in the family. I'll be obliged if you'll apply it to this problem.'

For an hour an anxious conclave surrounded the spread-out ordnance map. Wattie was summoned, and with a horny forefinger expounded the probable tactics of Macnicol and the presumable disposition of the navy guard.

At the end of the consultation Lamancha straightened his back. 'The odds are terribly

steep. I can see myself dodging the navvies, and with Wattie's help getting up to a stag; but if Macnicol and the gillies are perched round the Sanctuary they are morally certain to spot us, and, if we have to bolt, there's no chance of getting the beast over the march. That's a hole I see no way out of.'

'Janet,' said the colonel, 'do you?'

Janet was looking abstractedly out of the window. 'I think it is going to clear up,' she observed, disregarding her father's question. 'It will be a fine afternoon, and then, if I am any judge of the weather, it will rain cats and dogs in the evening.'

'We had better scatter after luncheon,' said Lamancha, 'and each of us go for a long stride. We want to be in training for to-morrow.'

After the colonel had suggested half-a-dozen schemes, the boldness of which was only matched by their futility, the Radens rose to go.

Janet signalled to Benjie, who slipped out after her, and the two spoke in whispers in the hall while Archie was collecting the mackintoshes from the kitchen. 'I want you to be at Haripol this afternoon. Wait for me a

little on this side of the lodge about half-past three.'

Benjie grinned and nodded. 'Ay, lady, I'll be there.' He, too, had a plan for shortening the odds, and he had so great a respect for Janet's sagacity that he thought it probable that she might have reached his own conclusion.

As Janet had foretold, it was a hot afternoon. The land steamed in the sun, but every hill-top was ominously clouded. While the inhabitants of Crask were engaged in taking stealthy but violent exercise among the sinuosities of Sir Archie's estate, Janet Raden mounted her yellow pony and rode thoughtfully towards Haripol by way of Inverlarrig and the high road. There were various short-cuts, suitable for a wild cat like Benjie, but after the morning's torrential rains she had no fancy for swollen bogs and streams. She saw Benjie lurking behind a boulder near the lodge gates, and in the shelter of a clump of birches engaged him in earnest conversation. Then she rode decorously through the gates and presented herself at the Castle door.

(Continued on page 325.)

A. QUEENSLAND HIGHWAYMAN: 'ALPIN MACPHERSON.'

By F. W. ALLEN.

LIKE any other new country, with its huge vacant spaces and favoured with a nice, healthy climate, outlaws found that Australia lent itself to the fresh-air life of the bandit during spring, summer, and autumn. As a rule, these men came from the class of undesirables who had been sent from the United Kingdom for the benefit of their country, and, after serving a term in their new abode, had been liberated under 'ticket of leave.' As a consequence, their influence among the rising generations of white natives was not always for the good. In this way gangs were formed, who were all fine, daring horsemen, who shifted about continually and preyed on the mail-coaches and horse mails; also upon squatters and travellers carrying money, and upon country storekeepers. This was long before the new country had telegraph wires; so, after a robbery, the bushrangers, as they were called, had ample time to get away to their unknown fastnesses, from which the gang would next make a raid in another direction. They always had the best horses to be secured in Australia, because they stole any good horse they came across and discarded their tired animals. Naturally, the limited Press of the day always gave full particulars of these 'sticking-ups,' as they were called, indicating the names of the outlaws when known, or describing their personal appearances when unknown.

In this way the notorious gang led by Frank Gardner, in New South Wales, was advertised

all over Queensland, and many young Queenslanders of that period, in the exuberance of youth and ambition wrongly directed, became fascinated with the exploits of the daring 'Dick Turpins,' who were looked upon by some as heroes. When Gardner found that the police and squatters were tightening up their grip of the situation, he was persuaded by an admirer (the wife of a squatter) to resign the leadership of the gang, and trek with her overland, by a covered-in spring cart, to the Clermont goldfield, just discovered in Queensland, without being recognised by the police or anyone else. At a wild bush spot here, known as Apis Creek, this plausible ex-highwayman opened a bush public-house under the name of Christie. This brings me up to the point of my narrative.

Living on the estate of a large squatter, of the Brisbane River, was the family of a Highlander named Macpherson, who was employed among the stock there. They were humble Highland folk, fresh from the glens and braes of their native land, and as honest as the sun. Among the family was a handsome boy, splendidly built, as active and lithe as the deer of his native braes. He was a pure Gael, with the impulsive temperament of his race, and was very anxious to go to school, as the squatter's family did. This was quickly noticed by the squatter and his wife, who saw that Alpin had this opportunity with their children.

All went well for some time. Alpin made

rapid strides, because he was clever, and was able to read the occasional newspapers which came to the squatter's home, where the exploits of Gardner's gang were set out in bold print. Being a splendid rider, and a perfect fiend in devouring any 'Wild West American' shallow literature which happened to blow into the settlement, Alpin had a passion for the wild romantic life of the bush. By this time his parents wished to give him a trade, and expressed their wish to the squatter, who was able to promise to have him apprenticed to a Mr Petrie, of Brisbane, a fine Scotsman, who had the leading stone and brick business in Queensland. In due course, Alpin joined the staff of Mr Petrie, and persevered with his educational progress there by attending the Mechanics' Night School.

Now occurred one of those events in the life of a young colony which was to alter Alpin's future career—a general election. Alpin's leanings were towards Liberalism, as opposed to the policy of the Conservatives—these were the only political distinctions of those days. A prominent, aggressive Liberal then was a legal gentleman named Charles Lilley, afterwards Sir Charles Lilley, the father of Queensland's National, Free, Non-Sectarian, Primary Educational System of the present time—one of the best in the world. Lilley was speaking at a public meeting one night, in Fortitude Valley, now the most thickly settled portion of the city of Brisbane. The bone of contention was a Militia Bill, which he was advocating, as the Crimean War had just finished, and he thought the young state should have the foundation of a defence force, in case it was required. This was opposed by the Conservatives, and, while addressing the meeting, the young bloods of this party pelted Lilley with stale eggs. This worked Alpin and his mates up to boiling-point, which was further aggravated when the opposition attempted personal violence towards Lilley. Then Alpin waded into them, in quite the Highland style, and, instead of using the claymore, introduced jolts, right and left crosses, upper-cuts with the lightning left, finding a billet every time. In a few minutes several youths were down and out before the police gained control.

After this the germ of democracy, which had hitherto been in the embryo stage, burst out, and unfortunately was not properly directed. Alpin became soured with town life, and silently disappeared, to turn up at his old home. Seeing the course events had taken, the squatter at once employed him as a stockman, and he was to assist in overlanding cattle to a large area of country, which his master had just secured, not far from the new Clermont goldfield. Here he met the silver-tongued, plausible ex-bushranger, Gardner, who always held up the exploits of his old gang to the impressionable young men who called at his inn.

This was the match to Alpin's explosive

nature, and he at once became a highwayman by robbing Wills's Public House, not far away. After this he worked his way south by the back tracks, and joined Gardner's old gang, which was then led by Gilbert. The officer in charge of the police in New South Wales, who was running down the gang, was a clever amateur horseman named Pottinger, whom the professional racing riders detested, as did Alpin's new comrades. In a fight between Pottinger's police and the gang, where firearms were freely used, Macpherson was wounded and captured. On his way to Sydney to prosecute Macpherson for firing at him Pottinger suddenly expired, so, as a result, the case collapsed, and instead Macpherson was sent under escort to Queensland by steamer to stand his trial for robbing Wills's Public House. When the steamer was at Mackay, Macpherson suddenly vanished. A clansman had provided him with a file, by which he had removed the leg-irons and handcuffs. A horse was waiting for him, and he was once more a free man, to roam the bush for a year or so, at the age of twenty-four.

From that moment Alpin became the bush-ranger known as the 'Wild Scotchman.' He was not of a cruel nature, and never afterwards fired at anyone, but, working alone, robbed mails and squatters, but never interfered with working men. He was never known to use violence or to rob a woman, so, for these traits in his character, he had many friends and sympathisers in the bush, particularly among women of all classes. Being an expert horseman, he got over long distances quickly, and avoided arrest for a year or two, after which the net of the law began to tighten around him. Eventually, tired out from hardships and exposure, he surrendered to some citizens.

Under present-day conditions his first offence would have come under the 'First Offenders' Code.' He expiated his crimes at Queensland's St Helena, which was his home for some years.

The two following episodes out of many will be interesting. On one occasion, near the town of Roma, he was being sheltered by a publican and his wife, with the police all around him, when he actually assisted in the kitchen, dressed as a female, and had a good look at his would-be capturers as they dined at this bush public-house, after which he was able to leave at his leisure. On another occasion, when seven miles from Taroom, he came across an elderly scragman alone, and in great distress, because he had just been robbed by the 'Wild Scotchman,' Alpin Macpherson, of his savings for the first year. Alpin quickly asked the old man what his robber was like, which way he had gone, and quickly galloped after him and overtook him, hailed him up, and at the revolver point ordered him to disgorge his loot or die where he was, as the speaker was the 'Wild Scotchman.' The impostor quickly obeyed, and Macpherson very

soon returned to the scragman, holding out the wallet, and asked if that was what he had lost. 'Yes,' was the reply, and its owner gleefully accepted it, Macpherson remarking, 'That fellow was a low-down thief and impostor; I am the "Wild Scotchman."' A short time before Macpherson died, which was only a few years

ago, I saw him in Northern Queensland, where he had a 'Wild West show of rough riders.' He was an old weather-beaten, wiry man, who walked as erect as a guardsman, and, as my companion and I left, we both felt his was a life wasted; he had come on the scene fifty years too soon.

A COUNTER-ATTRACTION.

CHAPTER III.

I.

AT Margrave and Wilson's Rose Maddison found herself in an entirely different atmosphere from that of Rotherton's.

The stately, silken ladies who moved quietly about on the rich carpets of the show-rooms, exhibiting fabrics and garments of fabulous cost to exigent customers, *never* scribbled hurried bills, or yelled 'Sign'; nor did the customers carry away light articles of millinery in thin paper bags printed with a blatant advertisement.

Such goods as were on show—there was no great display—bore no flaunting price-cards, proclaiming 'the latest style,' or 'very cheap'—they were not—but were discreetly marked in cabalistic characters, and the cost was revealed as a confidential secret, when asked for, or perhaps mentioned casually, as a matter of quite secondary importance.

Men—except the few immaculate beings who would have been shop-walkers upon a lower plane—were seldom seen within the dread portals. Occasionally a dejected male captive appeared in the train of some fair lady, exhibiting all the boredom, but not the patience, of the dogs tethered outside.

Rose owed more than she knew to Sir William's private letter to John Margrave. It was due solely to the personal friendship between the two men, who had attained commercial success by entirely different business methods, that one with so little training had found a place among the Olympians.

Rotherton's was emphatically *not* the type of house from which they drew recruits.

'Yes, my dear, we live in a world of our own,' observed the stately lady of the 'mantles' one evening, when Rose commented on the curious social isolation of the shop-assistant. 'We are neither flesh nor fowl. It's not such a bad world either. You will find there are as many grades and classes in it as there are in the world of customers outside. That's all they are, really, just customers. When you've got that thoroughly into your head, you'll find that their insolence and bad manners won't worry you. They're an amusing lot, and need humouring—just like a cow when you're milking her.'

Rose fully realised the soundness of her friend's philosophy, and strove, with indifferent success, to identify herself with the world she now lived in.

Many times during the month she had been there, women she had once known entered the show-room, but the chance resemblance of a shop-girl to a half-forgotten friend had no interest for them, and she had ceased to fear recognition. Therefore, when one morning Irene Seagrove came in, she continued her work unperturbed; it was not yet her privilege to wait on customers.

Irene, however, had different views. As soon as the 'sales-lady' had departed to find what was required, she walked over to the stand that Rose was arranging. The girl turned in surprise. 'Now, Rose, it's no use pretending to look through me. You don't intend to cut an old friend, do you?'

Rose smiled. 'Of course not, Rene. But you really must not talk to me here. Rule 14 says—'

'All right, I won't shout. I suppose I may admire these sables, and ask the price without compromising you?'

'Certainly, madam. The price is—'

'Now, no nonsense, Rose. I came early because I heard you were here—never mind how—and wanted a word with you. Will it imperil your immortal soul if you come to a *matinée* with me on Saturday, and have tea somewhere? I want to talk over our murky past.'

'Just you?'

'Just me. We'll go to the upper circle, if you like.'

'I should love it, then. But I'm not going to be patronised by your mother, Rene, so don't give me away.'

'I won't. We'll share the guilty secret. Where shall I find you?'

'19 North Melton Street. They keep us girls there, unspotted from the world, in charge of a dragon. Doors locked at ten, eleven on Saturdays.'

'Right. Here comes a noble duke, with "Rule 14" written all over him.' She raised her voice, and drawled, 'Thank you so much. Far beyond my means. I only asked out of curiosity. —Thanks, yes, I am being waited on.'

The return of the 'sales-lady' with sports coats closed the incident, and with a graceful bow the superintendent continued his morning round of inspection.

II.

'Certainly not, Rose!' Irene emphatically negatived her companion's choice of a refreshment house as they came out of the theatre on Saturday. 'Music with my tea always irritates me, and I refuse to squeeze my way into a glittering marble palace, and fight for seats with a crowd. Let's go to Rumpelmayers. You used to like their cakes and things.'

'That's all very well, Rene, but I shall be getting "above myself." This afternoon is going to my head, rather, and I don't want to be turned into a pillar of salt.'

'Then don't look back. Take what the gods send, and go straight ahead. I am playing Providence to-day, and I decree tea and ices at Rumpelmayers.'

'I bow to the decree of Providence, of course,' returned Rose, laughing. 'Do we go on foot, or have you a glass coach with six horses handy, my fairy godmother?'

'I have not, my Cinderella, but here's a taxi, with fifteen horses bottled up under the hood. Far more comfortable, and just as likely to carry us to the prince. Who knows what lies below the horizon?'

Certainly Rose did not, nor did she care very greatly. The gaiety of her companion was infectious, and the evident pleasure that Irene showed in the renewal of their acquaintance swept away all reserve. She abandoned herself to the pleasure of the moment, content to follow whithersoever she was led.

Her composure received a severe shock, however, when she entered the confectioners'. Seated at a corner table at the back of the tea-room were Sir William and Lady Rotherton.

It was too late to withdraw. Sir William had seen them, and risen to his feet, as Irene hurried across the room and greeted him effusively.

'Why, Sir William, what are you and auntie doing in town? Shopping excursion? The world's a small place, isn't it?—but I think some one's said that before. Auntie, this is Rose Maddison; you remember her father, don't you?—Colonel Maddison. We've been doing a *matinée* together, and we're both dying for some tea.'

She paused for breath. Rose had taken her courage in both hands, and recovered her self-possession. Sir William was looking at her with a quizzical smile, and she fancied, somehow, that Irene's surprise had been just a trifle overdone; was the meeting purely chance? And if not, what then?

She was intensely puzzled, but determined to play up to any lead that was given her. It was Sir William who gave her the cue.

'I am delighted to meet the daughter of my old friend,' he said, with the slightest emphasis on the last five words. 'You must have tea with Lady Rotherton and myself. I notice that madcap has forgotten to mention my name to you, but I think you have met my son.'

'Why yes, my dear,' Lady Rotherton broke in. 'Don't you remember Harry speaking of a Miss Maddison that he played tennis with at Seagrove Court, just before he sailed?'

Rose acknowledged the informal introduction gracefully, and paused, with wrinkled forehead, before seating herself, as though trying to recall some elusive memory. 'Of course,' she said, smiling graciously. 'How stupid of me! There *was* a Lieutenant Rotherton—such a nice boy—I remember him quite well now. Rene and he were cousins, were they not?'

'Sort of,' Irene cut in. 'Lady Rotherton is my distant aunt. It's a family puzzle. "If that man's father was my father's son, what relation is Dick to Tom?" I think it goes. I never could understand it.'

'My dear Irene!' exclaimed her 'distant aunt,' 'drink your tea, and do not talk nonsense. You must excuse her, Miss Maddison. Are you living in town now?'

'At present, yes, Lady Rotherton. I am sharing rooms with some other girls, near Bond Street. We are none of us rich, you know.'

'How delightful! You must enjoy the freedom of it. And so convenient for shopping. Have you solved the servant problem? I tell my husband that there *are* no servants nowadays. The young girls all drift into the shops and factories. I can't think why. *Such* a mistake to educate young people above their station, don't you think, dear?'

'Indeed, Lady Rotherton, I can sympathise with you. I remember very well the difficulties my dear mother had to contend with. We are mercifully spared; we have a most efficient and economical housekeeper.'

'A pearl beyond price, my dear. I wish you could find me one. We have taken a house in Bruton Street for the season, you know. *Do* come and see us on Wednesday—my "at home" day. My husband will be away, he has so many calls upon his time; but I think Harry will be at home.'

'Thank you so much. I'm so sorry; I shall be—er—shopping until quite late on that day—a long-standing engagement that I cannot evade, or I should have been delighted.'

'How very unfortunate.—William, you must take something for that cough' (he had given vent to a stifled croak, that *might* have been a cough). 'Some other day, then. Come and dine with us next Saturday, if you are free. My husband will be in town; Harry, I am afraid, will be away. He usually goes into the country for week-ends, so they seldom meet at home now.'

Rose was driven into a corner. Lady Rotherton evidently believed her free from guile—indeed, she had adhered strictly to the literal truth so far—but Sir William, was he merely making the best of an awkward situation?

'I think——' she hesitated, as though considering her social engagements, and glanced at him; he gave an almost imperceptible nod; 'Yes, I am sure I am free on Saturday. It is so kind of you.'

'So that's that,' said Irene. 'Come along, Rose. You shall dine with me to-night, in Soho, and I'll introduce you to an artist friend of mine, "such a nice boy," although his hair doesn't curl, like Harry's.'

III.

Lady Rotherton seemed preoccupied on the drive home, but that evening after dinner, having by then marshalled her forces, she opened fire upon her husband. 'I'm so worried about Harry, William.'

'Are you? I'm not.'

'You see so little of him now. In fact, he seems to avoid you. Couldn't you get him to stay at home next Saturday? Business, or something.'

'Now look here, Julia. Don't go throwing any more girls at his head. He ducks every time.'

'I know. I shall not say anything to him. But he's so changed lately, and so restless. I'm afraid there's some entanglement—wasn't there one of your girls——?'

'I've attended to that.'

'Yes, dear. But I'm sure he's not happy. I believe he's been trying to find her. Now, if he were to meet that nice girl, Rose Maddison, here—unexpectedly—she's so charming, and so sympathetic—who knows? She *might* prove a counter-attraction——'

Sir William sat up in his chair, and stared at his wife for a minute before speaking. Then he growled, 'Well, I suppose you must have your own way in the matter. You generally get it in the end, don't you? But don't say anything to the boy.'

Left alone, the frown vanished. He sat back and laughed. 'Counter-attraction, eh? Well, the responsibility is off my shoulders, anyhow. Irene's a trump, though. Artful as a wagon-load of monkeys. Must see what I can do for that artist man of hers.'

CHAPTER IV.

I.

HARRY ROTHERTON was having a rotten time. Rose had vanished into thin air, his father was unapproachable, and his mother inclined to be vaguely reproachful and lachrymose over the affair of Irene. Irene herself had

apparently deserted him and gone over to the enemy, and altogether—well, what was a fellow to do?

He bolted up to town—his father had said that Rose had gone to London—and established himself at his club, until his parents followed and took that beastly house in Bruton Street. Hang it all, why couldn't they leave him alone? He wasn't a child, to be tied to his mother's apron strings!

In desperation, he set himself the impossible task of combing through all the establishments that resembled Rotherton's in the Metropolitan area, and soon found that his six month's leave would require to be extended to six years, if he was to work through the alphabet.

He wandered past countless miles of counter, and acquired an uncanny knowledge of the prices of ladies' underwear. He reached the B's of Brixton, narrowly escaping arrest on suspicion of shop-lifting, and discovered that his description was in the hands of the police before he came to his senses, and realised the utter absurdity of his quest.

His mother was for ever manœuvring to throw him into the company of 'charming girls,' until he became as wary as an ancient trout, and fled to cover whenever a dainty confection of fur and feather floated into his field of vision.

Between his father and himself there was a state of armed neutrality. He rehearsed, while lying awake at night, many speeches; defiant, pathetic, or argumentative; sound common-sense, sweetly reasonable, and quite convincing. Somehow, he never could fire them off. Whenever he tried to make an opening, his father, by some apparently casual question or remark, would gain his unthinking assent to a viewpoint or proposition that utterly stultified the whole of his carefully-prepared arguments.

After twice being decoyed into a morass of words, he gave it up, and took to spending week-ends in the country, when his father was in town.

The week following his meeting with Rose and Irene, Sir William, by chance or design, delayed his departure from London, and met his son at breakfast on Tuesday. After a curt greeting, he continued the study of a legal document he was reading when Harry entered the room, making pencil notes on the margin. Harry caught a glimpse of his own name inscribed on the back of it, as his father folded it and slipped it into its envelope, continuing his meal in silence. Sir William perfectly understood the demoralising effect of silence on such occasions.

At length he spoke sharply. 'Harry, I want you to be here on Saturday when I return to town. I shall be up in time for dinner.'

'Why, sir?'

'To oblige me.'

This seemed to Harry a favourable opportunity

to assert his independence. Quietly, of course, and without heat, but firmly. With all the dignity and assurance of the twenty-four-year-old man of the world, he replied, 'Of course, sir, if you make a point of it, I will keep that evening free. But you must realise, father, that I am no longer a boy, to be told what I must, or must not do. I have my own life to live, my own—'

'Certainly, certainly,' interrupted his father, cutting short the oration. 'That is exactly the point. I quite agree with you. We don't see eye to eye in all things, but I'm glad you realise the responsibilities you are shouldering. It's the right spirit. As you remark, a man, if he is a man and not a parasite, should live his own life, and make his own way in the world. Living on an allowance from parents only pauperises him, and makes him dependent on their whims. We'll cut the painter on Saturday, my boy, and after you have signed some papers I shall have for you, you will be free to shape your life as you please. I shall put no obstacles in your way.'

Harry's eloquence was dried up at the source. He felt that he had been outwitted, yet he could not dispute the truth of his father's platitudes. The personal application of moral maxims is seldom pleasing.

Seeing the boy at a loss for words, his father proceeded to rub it in. 'I don't know if you will find it practicable to remain in the navy, especially as I believe you are thinking of getting married. It's your affair, of course, and I don't want to interfere with your plans; but if you should need a little assistance in starting some more lucrative profession—or trade—be sure and let me know. I hope you will not entirely drop us when you leave here. We shall always be pleased to see you.'

Harry muttered something under his breath, which might have been thanks for his father's kind offer—or might not!

He followed him to the front door, trying to formulate some protest, but the words would not come. It was not precisely this form of independence he had meant to claim, but after listening to the wisdom of the serpent, he could not say so without appearing, even in his own eyes, as a miserable weakling.

On the door-step Sir William fired his Parthian shot. 'By the way, if you have any bills that the final instalment of your allowance will not cover, bring 'em to me on Saturday, and I'll take them over. Best to start clear, and you'll not find me a pressing creditor. Good-bye.'

(Continued on page 329.)

THE HOOKWORM AND ITS RAVAGES.

ONE by one the diseases which have done so much to shorten human life are being effectually combated, if not actually eradicated. Among these are malaria, yellow-fever, typhoid, bubonic plague, small-pox, scurvy, and cholera, none of which is now the great scourge it was in former times. The degeneration and consequent downfall of Greece and Rome have even been attributed to the insidious effects of malaria in countries where it had previously been unknown. Those who have studied the hookworm disease (the very existence of which was unknown while it was committing fearful havoc) will, at least, admit the possibility of such a cause.

As an indication of the comparatively recent nature of the discovery of the hookworm, it may be noted that even the name is not to be found in any but the most up-to-date dictionaries and encyclopædias. Yet the hookworm has existed for thousands of years, perhaps as long as the human race. A papyrus written about 3640 years ago contains a description of a disease in Egypt which modern physicians declare can only be diagnosed as that produced by the hookworm. It is only, however, during the last few years that this parasite has been studied and shown to be the cause of certain ailments and physical

conditions which were formerly attributed simply to the debilitating effect of a warm climate; just as the presence of malaria (as its name indicates) was attributed to the pestilential atmosphere supposed to hang over the swampy regions where it was endemic. We now know that these swampy regions are simply breeding-places for the mosquito, which is the real carrier of the scourge.

Generally speaking, the hookworm is confined to tropical and semi-tropical regions, for its range is approximately between thirty-six degrees of north and thirty of south latitude. It will thus be seen that practically the whole of Europe is outside the hookworm area. Yet Europe is not wholly exempt, for although in that continent the hookworm does not propagate freely above ground, it is found even there in mines and underground workings. It has been observed in mines in Wales, Germany, Switzerland, and France. It also made its appearance amongst the workers in the St Gothard tunnel during its construction, whence it was carried into the mines of Austria, Germany, and Belgium. Possibly the conditions of heat, moisture, and darkness which are generally found in subterranean depths are favourable to its development; so also are the insanitary conditions present in some underground workings.

Is there any danger of the hookworm disease assuming an epidemic form in Great Britain? Apparently not, if ordinary precautions are taken; but it need not be taken for granted that, simply because it is now confined to warm climates, it may not invade colder regions.

It has always been noticed that the inhabitants of tropical climates are usually subject to anæmia, languor, and a generally lethargic habit of body. It was supposed that this was simply due to climatic conditions. Yet to a great extent the climate is only indirectly to blame. It is not so much the heat which kills or invalids Europeans as the noxious parasites which are bred by the heat, as already shown in the case of malaria and yellow-fever. It is now known that severe anæmia and lethargy are often produced by the presence in the intestines of the hookworm, sometimes in considerable quantities. It literally saps the life-blood of the sufferer.

It was the Americans who first took radical and sweeping steps to eradicate yellow-fever and malaria, though it was British scientists who showed them the way. To them also we owe that thorough and effective campaign which has worked such wonders in the suppression of the hookworm in Porto Rico, the Southern States, and elsewhere. It is believed that more than 2,000,000 persons in the Southern States of the Union are more or less infected with the worm. This means a tremendous loss of efficiency. The effect produced by the hookworm is not a disease in the ordinary sense of the term, unless the infection is very severe. The person affected is seldom laid up or unable to attend to his ordinary duties, and would resent any imputation of being ill; but he performs his work in a listless and inefficient manner, an effect generally attributed to natural laziness and want of interest. It is, however, an abnormal condition which can quite easily be cured, with the most astonishing results. The formerly pale, anæmic, and apathetic person, who seems to take little interest in life, becomes suddenly rosy-cheeked and active; he works with zeal and energy, and his general intelligence is greatly improved—for the effects are mental as well as physical. On one estate in British Guiana, the manager reported that the productive value of the men was increased a hundred per cent. by treatment for hookworm disease.

The traveller in the United States is impressed by the comparative backwardness of the Southerners as compared with their Northern brethren. This refers, of course, to the white population, though it is descended from a virile stock more purely British than that of the North. When we find that the hookworm is common in the South, but very scarce in the North, one of the reasons may be shown. The hookworm is an even greater enemy to the South than the boll weevil, which has of recent

years wrought such havoc in the cotton fields. It is now suggested that the terrible mortality which prevailed in Andersonville and other prison camps in the South during the Civil War was largely caused by the hookworm. It is true, insufficient nourishment (the South was short of food supplies even for its own troops) and medical deficiencies contributed their quota; but the sanitary conditions in some of the camps were appalling, and such conditions favour the propagation of the hookworm.

The terrible effects of this parasite may be shown by the following account of a certain district in Virginia. The people had been set apart by marked peculiarities from those surrounding them. A nickname of reproach was given them; they were even regarded by some neighbouring communities as a distinct race. They lived in abject poverty; their mental power and morality were low. Of forty children in one school, thirty-eight had the hookworm—the other two came from outside this region. The case of one family treated by the Rockefeller Sanitary Commission is typical of many others. The mother had been anæmic from infancy; of six children one had died of 'dropsy' (really of hookworm disease); her husband only did half the normal amount of work, the oldest boy even less; their home had always been a one-room hut. One year after treatment for hookworm all who were old enough were at work; a new house was nearly built; sanitary conditions, formerly shocking, had been brought up to date; the whole family were on their feet, and the mother's first thought was for the better life of her children.

The Rockefeller Sanitary Commission and similar organisations have done wonders in eradicating the hookworm in some Southern districts. Travelling dispensaries, with competent doctors and well supplied with medicines, visit periodically the infected districts, giving advice, treatment, and medicines free. When the dispensary comes to a district, the people travel great distances to be examined; men, women, and children; rich and poor; white and black. A great part of the South is infected, and there are communities in which three-fourths of the people are victims of the hookworm. Every state was divided into sanitary districts, each under the charge of a local physician, who worked under the direction of a state administrator. Every person examined, if found infected, was handed a sealed envelope containing thymol prepared in doses, and a printed card with directions for taking the medicine, for preventing re-infection, and for treatment at home. In the tents of the travelling dispensaries sometimes more than four hundred cases were treated in one day.

One boy treated in a tent dispensary was sixteen years old and weighed only fifty pounds; he had been too ill to work for eight years;

his mother brought him nearly three miles in a buggy in her lap, telling the doctor she scarcely thought she could get him there alive. He was as pale as a corpse, thin beyond belief, and so weak that the doctor would not risk more than a child's dose. After treatment he completely recovered.

In one year, in nine states, 140,378 persons were treated, at an average cost of \$1.27 per patient; nor could the money have been better spent. Countless human beings were not only benefited in health, but helped to a better and higher scale of living.

A hint of the part played by intestinal parasites in tropical countries is given by the following record of the Bilibid prison in the Philippines. The death-rate under lay management was 238 per 1000; under the Bureau of Health after American occupation it fell to 70 per 1000, at which figure it stood until the prisoners were examined and treated for intestinal parasites (52 per cent. of them had hookworm); after that the death-rate fell to 13 per 1000. An inspector for the California Board of Health tells of a mine where 300 labourers were employed, of whom half were infected. The loss of efficiency was calculated by the owners at \$20,000 a year. In Porto Rico it was reported 'the disease has reduced

the average efficiency of the labour on the coffee plantations to 52 per cent. of normal; in some cases to 35 per cent.'

The hookworm is found in many tropical dependencies of the British Empire, perhaps more or less in all of them. It is common in the West Indies, and has been observed and studied in Queensland, Fiji, Samoa, and elsewhere. Yet it is easily cured by medical treatment and by strict attention to sanitation, which is the best preventative. It is supposed that the eggs of the worm are laid in the ground, especially where contaminated by the vicinity of cesspools, &c. The worm itself is about one-third of an inch long when full-grown. When of microscopic size it enters the body, generally through the skin. Those who go barefoot are especially liable to its attacks, but even the well shod are not immune. The female worms produce an incredible number of eggs, which hatch when deposited in the soil, and while yet invisible to the eye enter the feet. Thence they make a long journey through the body till they reach the intestines, to which they cling, and give forth a poison which produces the disease. As many as 4500 worms have been expelled from a single person; a sufficient indication of the effect they produce in sapping the vitality of their victims.

AT PILL'S AUCTION.

By AGNES GROZIER HERBERTSON, Author of *Deborah, The Summit, Patience Dean, &c.*

PART I.

I.

'DUKE VERNER read through a page of dry manuscript and whistled; then he read it through again and sighed. He let it drop on the desk, and a shaft of sunshine fell upon it. What a day upon which to be wrestling with dull accounts of people's squabbles! Summer had come back again—not the fickle, capitious summer just past, but a glorious summer of long ago. He looked longingly at the window, and it seemed to him that the chimneys he saw were fairy chimneys washed in gold.

Gilchrist, his clerk, was at the other desk. He said, his pen continuing to scratch its way across a sheet, 'I saw a bureau in Pill's auction-rooms yesterday, sir, that seemed to be the kind of thing you said you were looking out for: a nice broad writing-flap, and shelves above.'

'What's that?' asked 'Duke eagerly.

'A bureau, sir—in Pill's auction-rooms. Seemed to be what you want. Auction to-day—must just have started. I've got a catalogue here. The bureau's pretty far on—No. 159, I think. I've marked it.'

Gilchrist stopped scratching to open a drawer.

'Duke took the catalogue, read the description of the article. 'Don't think much of Pill's auctions,' he said.

'You never know,' said Gilchrist cryptically.

'No,' said 'Duke, 'you don't.' And Pill's auction-rooms were at a distance; that was in their favour. What a morning to be mewed up!

As he changed his coat, 'Needn't mention to anyone where I've gone. I shall be back in no time,' he said.

Gilchrist was scratching again. 'Right, sir,' he said.

The clock on the wall struck, and he glanced across at it. Rather early for Mr Verner to start. He would have a little time to wait.

II.

'Duke certainly dawdled. He went by side-streets, too, to avoid acquaintances. But he reached Pill's rooms long before Lot 159 was due.

The room was pretty full. 'Duke looked round. 'Wonder where those folk come from?' he thought. 'You never see 'em anywhere else. A weird crowd!'

They were, and rather depressing; also, the

room was dark and frowsty. What about taking himself elsewhere for a bit, and telling Gilchrist the bureau had been no good? But just then his eye fell on it, and after his eye went his heart. Why, the thing was just IT. 'Twas exactly what he wanted and had been looking for for ages to make that stodgy sitting-room of his a place to live in. Where had it come from? His fairy godmother must have placed it there, and guided old Gilchrist's eye to the spot.

But if he stared at it like this half the motley crew about him would tumble to the fact that he wanted it badly—must have it; and that wouldn't do at all. 'Duke withdrew his eyes from the object of his adoration, and looked about. No seats to be had anywhere; half the women were standing; but he must find standing-room where he could catch the eye of the auctioneer. Lord, what a pretty girl sitting there by the central table, and an even prettier one standing behind her!

'Duke had to look at them. The girl who was sitting looked delicate, but the other girl was healthy, radiant, arresting. Her hair, of a live warm brown, was simply arranged round her small head; her chin was rounded and firm; her eyes, of a deep and laughing blue, were darkly lashed and provocative. About the poise of her slight figure was a gallantry that was boyish, and a kind of mischievous daring.

'What a darling!' thought 'Duke. 'Wonder who she is?'

He secreted his catalogue in his pocket, and manœuvred till he was close to the girls. They were talking, and he heard the girl who was sitting call the other 'Bob.'

'Duke didn't really approve of girls being called by men's names—they had lots of *pretty* names of their own—but this time he chuckled. 'Suits her, suits her like a diamond!' he thought. 'Dear little name, sweet little name, fascinatin' little name!' Then he thought of Bob Walters, and scowled. Bob Walters was not dear, nor sweet, nor fascinating.

He said to the girl, with a winning smile, 'I wonder if you would mind lending me your catalogue for a minute.'

She gave it to him at once, and at the same time a square, honest glance that ended in a demure smile.

'Duke ruffled its pages, found page 4, and that the number of the bureau was 159; but then he had known that before. There was no mark against any item, except that a little oak stool which had been sold had its price written against it.

'Thank you very much,' said 'Duke, and gave the catalogue back to its owner.

'Your own is sticking out of your pocket,' said she calmly.

'Last week's,' said 'Duke, with a calm as great.

'Oh!' she gasped, and blushed.

III.

'Look at this, Bob,' said the other girl hastily.

'Duke did wish she hadn't; he had wanted to see what would happen next. What happened now was that both girls gave themselves to a close scrutiny of a disreputable red carpet.

'Lord, they can't want to buy *that*!' thought 'Duke.

Evidently they didn't. The girl on the chair said, 'Isn't it hideous?' And the other said scornfully, 'If anyone gave it to me, I should throw it away.'

'Duke wanted to say, 'So should I,' but knew his manners too well. What a nuisance manners were, and a lot of other things.

How delightfully she swung that little curved chin round when she looked at things. Her nose had just the slightest inclination to gaze up at the ceiling; exactly the kind of nose he admired. But really he must not stare at her like this, especially as he was standing almost at her side.

Absent-mindedly he brought from his pocket his catalogue, and studied it with great care. It was rather nice to look up suddenly and find Bob—as in his thoughts he called her—looking out of the corner of an eye at him. But his satisfaction died as the eye travelled on to the catalogue in his hands, and grew amused, then disdainful. 'Bob' stared maliciously at the catalogue till he reddened, then she looked away. He knew well that she had recognised it as one of this week's.

And what then? He didn't care. For all she knew, he was an absent-minded genius haunting the auction-room in search of copy. People of that kind always mislaid their catalogues and their spectacles, and all that kind of thing.

But somehow 'Duke, who was alive and rather alert, was not long comforted by that reflection, and grew sulky. 'Should like to take her down a peg, I should!' thought he.

Then his attention was distracted. A library chair was put up for auction.

'Quite nice,' thought 'Duke, 'and seems familiar somehow.' In a flash he realised why. In some way the chair suggested the bureau he thought of buying. They would go rather well together. 'I'll have a shot for it, and chance getting the bureau,' thought 'Duke.

Some folk opposite were bidding in a half-hearted fashion; he chimed in; right on his heels came the girl on the chair. The bidding bucked up confoundedly—such was 'Duke's reflection—the folk opposite decided really to want the chair; Bob's sister fought them; 'Duke threw himself into the fray. Then at one and the same time contrition and common-sense seized him. If that girl wanted the chair she'd better have it; besides, he—'Duke—was not

disposed to pay a fancy price for it. As he decided to back out, the hammer fell. 'Duke looked and felt dazed. In reply to his glance the auctioneer's clerk said, 'Yes, it's yours.'

With his other ear, as it were, he heard Bob say to her friend with a suppressed giggle, 'You nearly got in for that, Madge. I thought you had got it.'

Little devils! Were they bidding just for the fun of it? 'Duke cast them a wrathful glance. But they seemed so eminently pleased with life, so roguish, so full of chuckles, 'Duke found it impossible to do anything but chuckle himself. After all, one must have an occasional joke to keep one going, and he had not offered more for the chair than its worth.

IV.

'Duke saw Bob write the price of the chair in her catalogue, then pass the catalogue to her sister. They seemed to be doing a little sum on the side of it; perhaps adding up their available resources. 'Wonder what they'll bid for next?' thought 'Duke. If they weren't careful they'd get caught. He felt quite anxious on their behalf.

But Madge seemed scared, and Bob absorbed in calculations; and a number of dusty carpets, a procession of beds, passed by. Then came the bureau, Lot 159.

For a moment it hung fire, and 'Duke found himself making the first bid. A lady in a hat belonging to a bygone age made the second; a dealer followed; a man near 'Duke threw out an offer in a hesitating fashion; another outbid him firmly; 'Duke went one better; then a clear voice chimed in—it was the voice of Bob. 'And she doesn't want it, the little wretch!' 'Duke thought wrathfully. He cast her an angry glance, but she was bending to whisper to Madge. He was now quite at her side.

The auctioneer said, 'You together, you two? If so, you're bidding against each other.'

'Duke shook his head. Bob said clearly, 'No, we're not together,' and bid again. 'Duke waved his catalogue crossly at the auctioneer. Bob outbid him. The hesitant man, thinking there must be something in it, again entered the fray.

'I'll stop and leave them to it,' thought 'Duke with rage. He did, and watched. Really, he hoped she would get the bureau, and that it would land her in a fix. He hoped that it would upset all her calculations. Then suddenly she stopped, cheeks pink, turning a shoulder to the auctioneer. That silly idiot in the corner was to have the bureau—not much! 'Duke ground his teeth, bid again, and secured it.

He saw Bob bend over her sister; her shoulder shook a little. 'Lord, I'd like to tell you what I think of you!' thought 'Duke. 'You wouldn't laugh when I'd finished with you!'

His sleeve was brushing hers. When she

straightened herself again, he turned on her. Bidding for the next lot was going on. Under cover of it, he said furiously: 'You did that very well, didn't you? And you didn't want it; *you know* you didn't.'

She was taken aback, and for a moment looked ashamed. Then a dimple caught her cheek. She met his angry eye with coolness. 'Well, I did and I didn't,' she said.

'Duke could have shaken her. 'You'd have been pleased if you'd got it, wouldn't you?'

She shook her head without a blush. Then she said defiantly, 'It's a lovely thing, anyway, and well worth what you offered for it.'

'I'd have got it for a lot less but for you,' said 'Duke. 'Didn't you carry the joke a bit far? I'd go home, if I were you, before I got into any trouble.'

To this she refused to reply.

'You can play that trick once too often,' said 'Duke.

'Let me see,' said Bob, slowly, 'have we been introduced?'

'Duke decided to pay for his purchases and go.

As he was arranging for the removal of them he saw the two girls leave their place, and began to struggle toward the door.

'Oh, you're taking my advice, are you?' he muttered.

But somehow as they passed him, smiling, pink-cheeked, triumphant, he couldn't be sure that they had. It seemed more likely that they had chosen to leave the joke when at its best.

V.

Gilchrist looked up interrogatively.

'Yes, I got it,' said 'Duke laconically.

'I thought you'd be taken with it,' said Gilchrist. He paused.

'I got it for a fair price,' said 'Duke, answering the unspoken question. He mentioned the sum.

'Imm, yes—quite fair,' said Gilchrist. 'I should have thought you'd have got it for less, though; there's a slump in furniture just now.'

'Duke said in a pugnacious tone, defying his own reflections, 'Well, anyhow, I haven't been done over it.'

'Oh, no,' said Gilchrist equably, 'you haven't been done.'

VI.

The bureau certainly looked well in the place 'Duke had prepared for it, and the chair fitted it like a glove.

'You bought them together, I suppose,' said Bob Walters, who had blown in.

'Well, no, I didn't,' 'Duke said in a pleased tone.

'They seem to mate,' said Bob.

'I thought they would,' said 'Duke.

'There's an attraction about 'em,' said Bob. 'If you ever feel inclined to part with 'em——'

'Oh, I sha'n't,' said 'Duke with decision.

There was something rather specially jolly about that old bureau. For one thing it reminded him of another Bob; and although she deserved to have her neck wrung, she was quite a nice thing of which to be reminded.

His cousin Celia saw the bureau a day later. She said, patting it lovingly, 'I like those little squiggles. The thing has character, too; it's the kind of thing a child would love and would remember when it was older.'

That idea pleased 'Duke vastly. He said, 'You're right; it is.'

A school-boy nephew, come with a message from his mother, also looked at the bureau with interest. 'Golly, I like it. It ought to have a secret drawer,' said he.

'Duke agreed that it ought.

VII.

And on the following evening, having removed all the obvious drawers, and taken the thing to pieces generally to give it yet another dust and polish, he came upon that secret drawer. His finger scrubbed upon a tiny knob at the back of another drawer.

He sucked the finger, then he felt for the knob again, and, a queer feeling coming over him, pushed it. Something slid noiselessly aside; 'Duke explored with his fingers the vacancy revealed. But no, the secret drawer was not vacant; he drew out a crinkling mass of papers—notes, treasury and bank notes, more of them, and more.

'Golly!' said 'Duke, and blessed the school-boy nephew for the expression. He cleared the drawer of notes, fluttered them all to the floor, sat there with his pipe going out, and began to count.

Five hundred pounds exactly!

'Duke sat looking at them in a fascinated way. He said at last aloud, 'Orrid temptation for a poor lawyer. Good thing I'm an honest man.'

Having replaced the notes in their hiding-place, he examined the bureau still further, but there were no more secret drawers. Then he actually had a look at the chair. But there was nothing doing in that quarter.

He wrote then to Pill's offices; must find out whence the bureau had come.

VIII.

Meantime he ran into the aggravating but irresistible Bob; or rather, she ran into him; for in coming out of a shop she faced him. Recognition flashed to her eyes; in a puzzled way she bowed. Before she could have time to place him 'Duke acknowledged the bow, and got a smile. Then he said cheerfully, 'Been to any auctions lately? They're such fun.'

A pity he had yielded to that temptation! He could see remembrance flash into her face, then dismay, then annoyance. With the coldest of glances, Bob brushed past him, and went on her way.

For a moment 'Duke stood pondering. 'Bit of a boulder I've been,' he said aloud, and a shopper turned to look at him and half smile. 'Duke didn't notice; he went chasing after Bob.

When he caught up with her—'I say, forgive me,' he said penitently. 'I've been calling myself everything you'd like to call me, and a lot more.'

In spite of herself, a little smile crept round Bob's mouth.

'Usually I'm better behaved. I know better; really I do,' pleaded 'Duke.

'Then prove it,' said Bob—'by going away.'

He did. There was nothing else he could do.

'But I hope my poor, sad face haunts her!' thought 'Duke.

(Continued on page 335.)

ULTIMA THULE.

IN my dreams a beach lies blazing

By a rainbow'd tropic sea,

And a green-girt isle of coral

Seems to hold my fate's decree.

There for mazy miles the sea-beach

With its whiteness blinds the eye;

And the sea-fowl stun the silence

With their weirdly human cry.

And a vine-bower built for dreaming

Has for ages blushed and bloomed;

Has for ages viewed the sunset,

Viewed the skies with stars illumed.

And for ages o'er its threshold

Not a human foot has trod;

From its hearth no wreath of wood-smoke

Has been wafted up to God!

But it stands there, time-unaltered,

On the sand-drifts by the sea;

Waiting, watching, hoping, dreaming,

Waiting Fate's own time—and me!

By the far-flung reef of coral,

Where the wild seas plunge and pour,

O'er the red-gold path of moonlight

Like a night bird seems to soar,

Skimming light-winged through the silence,

With its curved prow poised in air,

Silken-sailed a barque enchanted,

Where the sea-maids comb their hair.

Then the night air fills with music;

Silver harp notes float and flow;

While a love-song thrills the darkness

Where the orchids dimly glow.

In the scent-dew'd tropic twilight,

Heart to throbbing heart we twain

Stand and look out o'er the waters,

Where the cold stars wax and wane.

But the sea-wood groves grow chiller,

And the day-dawn wakes in fire;

Fare thee well, my isle of sunset!

Fare thee well, my Dreams' Desire!

MATT MARSHALL.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

THE new and revised valuation of King Edward the Seventh now being made, upon the lead of Mr Henry Wickham Steed and Sir Sidney Lee, is remarkable for the early application of the historical perspective, and the reversal of a former judgment. It does not appear to be merely a result of the Great War and the disturbance of men's standards and opinions, although, like all else, it has been affected by the great upheaval, and the wall of the war built between King Edward's time and now makes the historical perspective of fifteen years as sharp as was that of half-a-century, if not so steady. A part of mankind is peculiarly zealous when making the *amende honorable* and repairing an intellectual justice, assuming that no payment in cash or kind is incurred in such retribution. The confessor of a fault seems to perceive a bright reflection of honesty and nobility from his erstwhile victim back to his pathetic and humbled self, glowing, as he feels, with this fine sincerity. You will find, therefore, that within the next few months this new movement for the justification of King Edward, only germinating as I write, will make great progress. It will become a kind of cult, an affair of the intellect and conscience; duty and pride will be involved. Americans will hurry to the equestrian statue of the king in Waterloo Place before even they make their flying peregrination to Stratford-on-Avon, and on the 8th of November it will be our own patriotic business to lay wreaths upon the pedestal, the anniversary of the day when was born one who is now described with authority as one of the greatest kings with whom our country has ever been blessed. Lately the House of Lords has been worried by a question of the proposed removal of a piece of sculpture in its own private tabernacle, to make room for a memorial of the war. In this a symptom of the age is again indicated. In some foreign countries they are not sentimental concerning removal or even elimination of old memorials of homage and respect; one may be carted off for rubbish or set up again in a shabby quarter of a city to make room for the new hero who stands for all that the newly despised and rejected abominated, but our conservative people are

more loyal and generous to their old idols. At the time of the Diamond Jubilee, as I remember, there was a question of the statue of Queen Anne in front of St Paul's Cathedral being removed in order to facilitate certain ceremonies on Queen Victoria's calling there on the great day, but strong public sentiment being uttered against the proposal, the statue stood undisturbed. Now the great queen who was living then becomes herself a subject in like dispute, but we hold by the old respect. Her superb virtues can never be discounted; her glorious example in important ways of life stands at high value for all time; but while there is in some quarters a healthy reaction towards an appreciation of some points of goodness in the commonly condemned Victorianism, the historical valuation of the late queen does not rise. It may be suspected that, with our sensitiveness still so keen upon many matters relating to our late enemy, one reason is the Germanophilism that she entertained, even to the intrusion of her private fancies and affections into matters of state affecting the welfare of her people. We have been told frequently that the Kaiser sometimes caused her pain by his imperial and anti-British antics, and that she had occasion to reprove him; but a suspicion lingers that she was proud of William, and we are sure that there were interludes of association on important occasions upon the details of which we are not to be informed. The public remembers vividly the final scene of that association, the Kaiser in his most dramatic form and manner riding on a white horse through the streets and parks of London, while the bands wailed the mourning music of Beethoven, Chopin, and Mendelssohn on that cold winter's day when the queen was taken to her tomb. One has sometimes been astonished, even alarmed, at the temerity of modern criticism of the queen so soon.

* * *

Suddenly comes this complement in the discovery of the greatness and quality of King Edward. His value is being raised above that of statesmen, his sense and sagacity linked with a finely human conscience to make a fair approach to perfection in a constitutional ruler moving amidst the nefarious intrigues of a Machiavellian set of continental diplomats. And

specially, in distinction from what is imagined to be the attitude of Queen Victoria, he stood up against the Kaiser, treated some of his pretensions with studied contempt, and opposed him as a dangerous man with something of the mountebank in his disposition. It was said of the king that he spoke with a German accent, but that, anyhow, was all that was German about him. He was British first and last; afterwards, as France can never forget, he was her friend. What the public has not understood is the weight and value of his knowledge, prestige, and influence in these political affairs. We espied him ambling among the politicians; but did one Briton in a hundred imagine he was playing a leading part, that of first statesman, in the gravest political manœuvres, and displaying sagacity that others could not equal? Perhaps the work was better done in such secrecy from the people; it might have been impossible in any other way. However, the impression formed clearly on the loyal and patriotic British mind was that King Edward was just a simple human man, with human weaknesses well developed, a great lover of pleasure. He was devoted to various kinds of sport, which was well in a British king. He was devoted to racing, yachting, and shooting, and when Prince of Wales he was even elected captain of the Royal and Ancient Golf Club, but was either fearful, or thought less of the game—we have heard that he disdained it—than he should, and never played, a deputy performing the necessary ceremonies for him at St Andrews. He liked good food better than good art and literature. It has been said that he never read a book completely through in the whole of his life. On the other hand, we knew he was very fond of Paris; that Biarritz and Homburg and Marienbad in their various seasons gave him pleasure; that he disliked brown boots, and that, especially in Paris and New York, his taste in ties was assiduously pursued. Believing the solid evidence now dispassionately and disinterestedly adduced, we know that in this we did the king far less than justice.

* * *

Sir Sidney Lee, in a short biography written a dozen years ago, reflected what was probably the average well-informed impression of the king, then only two years dead. In some quarters it was felt that it gave too little praise. Since then he has had all manner of official papers, letters, the evidence of the best-informed witnesses laid before him for the purposes of the official biography, and he told us frankly, before the appearance of the book, that he was insufficiently appreciative on the first occasion of his treatment of the subject, and that he now regards King Edward as having been one of the greatest, wisest, and most beneficent of monarchs, a king among many. The statement is remarkable. We are away

in history now, and the obligation of loyal and conventional homage is small. After fifteen years we may now speak without hindrance the whole truth about a king. Now Sir Sidney Lee tells impressively of the king's lifelong shrewdness and his foresight; he realises the immense range of his interests, and the influence he exerted on affairs of serious import, not alone as sovereign but as heir-apparent. 'His versatility of interest,' we are told, 'is convincingly evidenced by the social intimacies which he sought and maintained with men of note in well-nigh every kind of human effort—sportsmen, explorers, medical men, actors, artists, as well as with soldiers, sailors, diplomatists, and politicians.' It seems that before he was thirty years of age he exhibited the acutest interest in all movements, especially in foreign policy. He was educated to hold himself aloof from the coteries of political party. But, so far as his political views were concerned, he seems to Sir Sidney Lee to have identified himself most closely with Lord Beaconsfield. Yet his correspondence with Mr Gladstone places the two men in the most attractive light, in spite of the fact that the king differed widely from the whole of the Liberal statesman's policy. Political differences, it is said, never interfered with the tender feelings which the Liberal minister and the heir-apparent cherished for one another always. His strong social instincts made him a firm believer in the value of personal intercourse in diplomatic negotiation. He became a very considerable influence in politics at home and abroad. Sometimes he boldly challenged public opinion by his private championship of men whom he believed to have been punished with undue severity for breaches of the moral code. He believed in peace, and, so far as his power went, endeavoured to make it prevail, but not if war were the only means for the protection of his country's interests. In pursuit of peace he and his ministers were impeded by the conduct and temperament of the Kaiser. Queen Victoria tried to repress him, but he was not to be repressed. Sir Sidney Lee's general impression now, from the fulness of the knowledge he has acquired, is that of 'a signally humane, human, and many-sided personality, hardly to be matched anywhere in biographic records. Among princes of any age or country,' he says, 'I think history will accord him a unique place.' Not displeased, but still astonished, will many readers be upon considering such an estimate.

* * *

But Mr Henry Wickham Steed has credit for having well anticipated Sir Sidney Lee in this appraisal, and having done it not merely from records stored in the Windsor archives and elsewhere, but from personal knowledge and intimacy developed upon the scene of grand international politics. Mr Wickham Steed shows us how King Edward acted for

part of a generation when, by dark and almost universal diplomatic intrigue of the most sinister kind, Machiavellian diplomats and statesmen, disdainful and contemptuous of the welfare of humanity, lived and worked, dreamt and slept in terms of possible war, seemed seeking always for an excuse for it, threatened it upon every move their rivals made. Europe was a nest of insincere, dishonest, diplomatic villains. Fraud and the deliberate lie, done for the meanest ends, received a kind of diplomatic sanctification by Bismarck's Ems despatch, and during the years between the war that resulted therefrom to the next big war, the science of the lie was exploited to its depths, and thereafter, as we sadly know, by means of the lie and monstrous intrigues, when cunning conspirators like Count Aehrenthal, the Austrian Foreign Minister, by birth a German-Bohemian, with at least a strain of Jewish blood in his veins, threatening war as if it were an affair of their own personal combat and nothing more, the fires were laid for our four years of bloody horror. Mr Wickham Steed describes to us an amazing scene at a banquet in Vienna in 1908. Aehrenthal said something about certain responsibilities to Sir Edward Goschen, the Balkans, as often, being the preoccupation of the moment. 'As to responsibility, let me say, my dear Minister, that the responsibility lies with you,' said Sir Edward Goschen; and Aehrenthal retorted angrily, 'Responsibility for what? Our responsibility is far less heavy than that of England, who committed all sorts of abominations against the Boers.' Then Goschen rejoined calmly, 'In the first place, England committed no abominations against the Boers. Secondly, if she had committed abominations, they would have no bearing on this matter. Thirdly, she did not violate an international treaty, as you have done. That is the truth; but you, my dear Minister, do not love the truth.' Then Aehrenthal loudly, 'Ah! I knew that England was standing by Russia. Well, if Russia wants war, she can have it.' The King of Greece heard Aehrenthal's angry voice, and came forward to put an end to the scene. That was how, at dinner-tables, they toyed with the chance of war, while our people worked and prayed, and little knew what good cause they had to appeal to God to bless their king. For we see Edward the Peacemaker, an honest man, loving his country and humanity, keenly wise in his generation, exercising a force of sense and prestige that was feared by his enemies as devils fear the light, moving carefully in a perfect discretion through this tangled crowd of Iagos and Ananiases. I have been quoting all along from Mr Wickham Steed, and here likewise: 'Against England, whose influence in the world Aehrenthal was incapable of understanding, so vicious an agitation had been carried on in the Austro-Hungarian semi-official press that, when I saw King Edward at Marien-

bad in August 1909, he still spoke indignantly of it. "'They lied about me; they lied about me!'" he exclaimed repeatedly, in so loud a voice that bystanders were startled.' I am reading again, and shall read yet again, this book by Mr Wickham Steed, recently published in two volumes with the title *Through Thirty Years*, which is the most interesting and important historical document, the most remarkable and illuminating set of connected revelations, of all that have been published concerning the diplomatic intrigues that led up to the Great War and what followed to the end. There is no other comparable to it. Mr Wickham Steed, later editor of the *Times*, is one of a few, to be reckoned upon the fingers, who are of the blood-royal of foreign correspondents, like statesmen, and consorting with kings and statesmen, with the advantage of the free-lance over them. In this remarkable work he shows us how he learned his business, equipped himself for his work, by living in foreign capitals, especially Berlin, Vienna, and Paris, studying men and movements on and below the surface, becoming familiar with the unseen forces of Europe that were leading her to her destiny.

* * *

At the time when the strain of the political situation in Europe was tightening, and the intrigues were deep and menacing, Mr Wickham Steed had many political conversations of an intimate character with King Edward. They made an abiding impression upon him, and this is his remarkable judgment: 'His grasp of the fundamentals of European politics was greater than that of any contemporary statesman whom I had met. His care for Europe was almost paternal. It sprang from knowledge acquired chiefly by personal experience and observation, and from an ever-present sense that, though England was the heart and head of the British empire, she was, and must increasingly be, an essential part of Europe. Had anyone called King Edward a philosopher he would have smiled; but no public man, certainly no monarch of recent times, has surpassed him in the practical philosophy of statecraft. Many ministers and monarchs were "cleverer" than he. He was not "clever," but able. In point of shrewdness King Leopold of Belgium was doubtless his superior, and Ferdinand of Bulgaria might have been more than a match for him in a mere contest of wits. But neither of them had King Edward's essential quality, the sympathetic insight that is born of good will. . . . He was not despondent, for despondency was alien to his temperament; and though his health was obviously precarious—there were anxious moments even during his stay at Marienbad—his doubts came rather from a premonition that the task of preserving peace, to which he had utterly devoted himself, would grow harder and harder as time went on.'

Later the author, remarking that the death of King Edward hastened the catastrophe of 1914, since Europe lost her leader, says: 'Those who are not known cannot be loved; and in the later decades of Queen Victoria's reign England was not known abroad. King Edward translated her to the Continent, and gained for her respect and, in some quarters, affection. He was a concrete and likeable embodiment of England. Whether he talked in English, French, or German, he always spoke "European," whereas most British statesmen speak an island tongue.' One time at Marienbad the king asked Mr Steed to keep him informed upon certain matters during their stay there, and, opening a conversation upon political affairs, remarked that he was told that Count Goluchowski was a dangerous fellow who ought to be got rid of. But Mr Steed showed how this man was trying to create a counterpoise in the Triple Alliance itself against German intrigues, and the king then exclaimed, 'Ah! I see why the German Emperor told me at Friedrichshof that Goluchowski was a false Pole and a danger to Europe.' Mr Steed said, 'The German Emperor may have his own reasons for wishing to get Goluchowski out of the way, but it does not follow that what are good reasons for him should be good reasons for us.' The king, 'Quite right. Never mind contradicting me if you think I am wrong.' Mr Steed, when alone, naturally fell to reflection upon the value of this force in international affairs to which he had been introduced. He writes: 'He was the recognised leader of Europe. Whither was he leading her? To some, the turn he had given to European affairs since his accession seemed statesmanship of the first order. To others, including not a few public men in England, he appeared to be an amateur diplomatist, the more dangerous because he wore the British crown. Which was the truer view? As I reflected upon my first talk with him, and analysed my impressions rather than his actual words, the reasons for his leadership and for the disquietude it had aroused became clearer. He was strongly magnetic—an essential quality in a leader; but his mind moved with a swiftness that could hardly fail to disconcert the slow-thinking among his advisers, who would also be likely to find his frankness startling and his directness of purpose uncomfortable. Moreover, he accepted, and even appeared to welcome, contradiction—a rare trait in a sovereign. In any case, an uncommon man and a big man, I thought.' Later experience convinced the author that the chief secret of King Edward's power really lay in his 'goodness of heart and honesty of intention.' In the near future we shall hear these points debated and argued with increasing detail of information and revelation upon historical happening. Here is the proposition, the resolution, 'That it is agreed that

King Edward the Seventh was one of the very best and most valuable of kings,' laid before us in an arresting form, with the opening statement of an advocate who is at the same time a very valuable and authoritative witness.

* * *

Were it possible, I would offer to accompany readers through more than eight hundred pages of what is largely secret and living history, written by a distinguished member of my craft, perfectly equipped in knowledge of affairs and how they were being turned and managed in the chancelleries, a witness of good and safe judgment; and, like his king, working for the honour and safety of Britain, which were being constantly threatened. He appears opportunely and ubiquitously among rulers and counsellors upon many a fateful scene, not only to listen and note, but often to be an intermediary, and even adviser. Representing the chief journal of the world, and being in a measure politically neutral concerning governments, possessing great knowledge and extensive acquaintance, Mr Wickham Steed held a position quite unique. Thus the story of his experiences *Through Thirty Years* could not be anything but intensely fascinating. I have suggested that the intrigues and the lying, the machinations of Aehrenthal and the rest, were repulsive to people of simple, honest mind, wanting good for the world, and, despite all war and peace disillusion, still clinging to a belief in human leaders, and so they were; but yet, like other wickedness, they are enormously fascinating. The volume dealing with the period of the war, and the making of the peace, when Mr Steed was editor of the *Times*, contains pure history that all may understand, and a surprising store of revelation. In the third week of July 1914 Mr Steed had gathered clearly from Count Mensdorff, the Austrian Ambassador, that Austria was bent on war, and that Germany was behind her. He drove to the Foreign Office, where his information was received with much scepticism. 'You are off your head,' observed an official. 'We have no proof whatever that Germany is not pacific; rather the contrary. And a public agitation now would spoil the whole diplomatic atmosphere.' A few sentences later the official again expressed his anxiety lest the precious 'diplomatic atmosphere' should be interfered with. Mr Steed said, 'The welfare of the country is more important than atmosphere. I have given you fair warning; and if your people will not let the country know what is afoot, we must. Otherwise, when war comes, nobody will know what it is about.' 'We' was, of course, the *Times*, and it did. Lord Northcliffe was then the chief proprietor. Mr Steed, who had a unique political and journalistic intimacy with him during most fateful years, portrays him in a manner that does nothing but confirm the clear and permanent impressions of others, in-

cluding myself, who at various times came close to him. Tremendous in energy, self-willed, limited in certain ways both as man and journalist, he was right through patriotic to the uttermost, and we see him here, with such a powerful weapon as the *Times* in his possession, exerting himself utterly and well. His test question concerning everyone who worked with him was, 'Does he understand the war?' the sign of 'understanding' being the conviction and personal determination that we must go right through to the end, with no compromises, and no leaving of the enemy unbeaten. Through these volumes bright anecdote runs. Listen to this. Just after the Armistice Mr Wickham Steed is at Farnborough in conversation with

the Empress Eugénie, and he is telling her what Paris was like on the Armistice day. 'Ah! that Clemenceau!' exclaims the Empress. 'Were he my worst enemy, I would love him, I could even kiss him, for the good he has done to France.' Wickham Steed: 'May I give M. Clemenceau that message, Madame?' The Empress (sharply): 'No, no message. I died in 1870.' Wickham Steed: 'But, Madame, 1870 is now dead. Your Majesty can live again.' The Empress: 'No, no; I am quite dead. But Clemenceau blundered. He should have attended the *Te Deum* in Notre Dame. He would have united France. He would have taught a great lesson of moderation and unity. He might have become *Consul*!'

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER X.—*continued.*

HARIPOL was immense, new, and, since it had been built by a good architect out of good stone, not without its raw dignity. Janet found Lady Claybody in a Tudor hall, which had as much connection with a Scots castle as with a Kaffir kraal. There was a wonderful jumble of possessions—tapestries which included priceless sixteenth-century Flemish pieces, and French fakes of last year; Ming treasures, and Munich atrocities; armour of which about a third was genuine; furniture indiscriminately Queen Anne, Sheraton, Jacobean, and Tottenham Court Road; and pictures which ranged from a Sir Joshua (an indifferent specimen) to a recent Royal Academy portrait of Lord Claybody. A feature was the number of electric lamps to illumine the hours of darkness, the supports of which varied from Spanish altar-candlesticks to two stuffed polar bears and a turbaned Ethiopian in coloured porcelain.

Lady Claybody was a heavily handsome woman still in her early fifties. The purchase of Haripol had been her doing, for romance lurked in her ample breast, and she dreamed of a new life in which she should be an unquestioned great lady, far from the compromising environment where the Claybody millions had been won. Her manner corresponded to her ambition, for it was stately and aloof, her speech was careful English seasoned with a few laboriously acquired Scots words, and in her household her wish was law. A merciful tyrant, she rarely resorted to ultimatums, but when she issued a decree it was obeyed.

She was unaffectedly glad to see Janet, for the Radens were the sort of people she desired as friends. Two days before she had been at her most urbane to Agatha and the colonel, and now she welcomed the younger daughter as an ambassador from that older world which she

sought to make her own. A small terrier drowned her greetings with epileptic yelps.

'Silence, Roguie,' she enjoined. 'You must not bark at a fellow-countrywoman.—Roguie, you know, is so high strung that any new face stimulates him. You find me quite alone, my dear. My daughters do not join us till next week, when we shall have a houseful for the stalking. Now I am having a very quiet delicious time drinking in the peace of this enchanted glen.'

She said no word of John Macnab, who was doubtless the primary cause of this solitude. Lord Claybody and Johnson, it appeared, were out on the hill. Janet chattered about the kind of topics which she felt suitable—hunting in the shires, the coming Muirtown Gathering, the political meeting of yesterday. 'Claybody thought Sir Archibald Roylance rather extravagant,' said the lady, 'but he was greatly impressed with Lord Lamancha's speech. Surely it is absurd that this part of the Highlands, which your sister says was so loyal to Prince Charlie, should be a hot-bed of radicalism. Claybody thinks that that can all be changed, but not with a candidate who truckles to socialist nonsense.'

Janet was demure and acquiescent, sighing when her hostess sighed, condemning when she condemned. Presently the hot sun shining through the windows suggested the open air to Lady Claybody, who was dressed for walking.

'Shall we stroll a little before tea?' she asked. 'Wee Roguie has been cooped indoors all morning, and he loves a run, for he is a wonderful little sportsman.'

They set forth accordingly, into gardens bathed in sunshine, and thence to the coolness of beech woods. The Reascuill, after leaving

its precipitous glen, flows, like the Raden, for a mile or two in haughlands, which are split by the entry of a tributary, the Doran, which in its upper course is the boundary between Haripol and Crask. Between the two streams stands a wooded knoll, which is a chief pleasure of the estate. It is a tangle of dwarf birches, bracken, and blueberry, with ancient Scots firs on the summit, and from its winding walks there is a prospect of the high peaks of the forest rising black and jagged above the purple ridges.

At its foot they crossed the road which followed the river into the forest, and Janet caught sight of a group of men lounging by the bridge. 'Have you workmen on the place just now?' she asked.

'Only wood-cutters, I think,' said Lady Claybody.

Wee Roguie plunged madly into the undergrowth, and presently could be heard giving tongue, as if in pursuit of a rabbit. 'Dear little fellow,' said his mistress; 'how he loves freedom!'

The ladies walked slowly to the crest of the knoll, where they halted to admire the view. Janet named the different summits, which looked ominously near, and then turned to gaze on the demesne of Haripol lying green and secure in its cincture of wood and water. 'I think you have the most beautiful place in the Highlands,' she told her hostess. 'It beats Glenraden, for you have the sea.'

'It is very lovely,' was the answer. 'I always think of it as a fortress, where we are defended against the troubles of the world. At Ronham one might as well be living in London, but here there are miles of battlements between us and dull everyday things. . . . Listen to Roguie; how happy he is!'

Roguie's yelps sounded now close at hand, and now far off, as the scent led him. Presently, as the ladies moved back to the house, the sound grew fainter. 'He will probably come out on the main avenue,' his mistress said. 'I like him to feel really free, but he always returns in good time for his little supper.'

They had tea in the tapestried hall, and then Janet took her leave. 'I want to miss the storm,' she explained, 'for it is certain to rain hard again before night.' As it chanced she did not miss it, but, after a wayside colloquy with a small boy, arrived at Glenraden as wet as if she had swum the Larrig. She had sent by Benjie a message to Crask, concerning her share in the plans of the morrow.

That night after dinner, while the rain beat on the windows, John Macnab was hard at work. The map was spread out on the table, and Lamancha prepared the orders for the coming action. If we would understand his plan, it is necessary to consider the nature of

the terrain. The hill behind Crask rises to a line of small cliffs not unlike a South African *kranz*, and through a gap in the line runs a moorland track which descends by the valley of the Doran till it joins the main road from Inverlarrig almost at Haripol gates. The Doran glen—the Crask march is the stream—is a wide hollow of which the north side is the glacis of the great Haripol peaks. These are, in order from west to east, Stob Ban, Stob Coire Easain, Sgurr Mór, and the superb tower of Sgurr Dearg. Seen from the Crask ridge, the summits rise in cones of rock from a glacis, which at the foot is heather and scrub, and farther up steep slopes of scree and boulders. Between every two peaks there is a pass leading over to the deep-cut glen of the Reascuill, which glen is contained on the north by the hills of Machray forest.

It was certain that the navy cordon would be an outer line of defence, outside the wilder ground of the forest. Wattie expounded it with an insight which the facts were to justify. 'The men will be posted along the north side o' the Doran, maybe half-way up the hill—syne round the west side o' Stob Ban, and across the Reascuill at the new fir plantin'—syne up the Machray march along the taps o' Clonlet and Bheinn Fhada. They can leave out Sgurr Dearg, for ye'd hae to be a craw to get ower that side o't. By my way o' thinkin', they'll want maybe three hundred to mak a proper ring, and they'll want them thickest on the Machray side where the ground is roughest. North o' the Doran it's that bare that two-three men could see the whole hillside, and Macnicol's no the ane to waste his folk. The easy road intil the Sanctuary is frae Machray up the Reascuill, and the easy way to get a beast out wad be ower the Beallach o' the Red Burn. But the navvies will be as thick as starlin's there, so it's no place for you and me, my lord.'

The Haripol Sanctuary lay at the headwaters of the Reascuill, between what was called the Pinnacle Ridge of Sgurr Dearg and the cliffs of Sgurr Mór. As luck would have it, a fairly easy pass—known as the Beallach—led from it to the glen of the Doran. It was clear that Lamancha must enter from the south, and if he got a stag, remove it by the same road.

'I'll get ye into the Sanctuary, never fear,' said Wattie grimly. 'There's no' a navy ever whelpit wad keep you and me out. But when we're there, God help us, for we'll hae Macnicol to face. And if Providence is mercifu' and we get a beast, we've the navvies to get it through, and that's about the end o' it. Ye canna mak yoursel' inconspicuous when ye're pu'in' at a muckle stag.'

'True,' said Lamancha, 'and that's just where Mr Palliser-Yeates comes in.—John, my lad, your job is to be waiting on the Doran side of the Beallach, and, if you see Wattie and me

with a beast, to draw off the navvies in that quarter. You had better move west towards Haripol, for there's better cover on that side. D'you think you can do it? You used to have a pretty turn of speed, and you've always had an uncommon good eye for ground.'

Palliser-Yeates said modestly that he thought he was up to the job, provided Lamancha did not attract the prior notice of the watchers. Once the pack got on his trail, he fancied he could occupy their attention for an hour or two. The difficulty lay in keeping Lamancha in view, and for that purpose it would be necessary to ensconce himself at the very top of the Beallach, where he could have a sight of the upper Sanctuary.

To Leithen fell the onerous task of creating a diversion on the other side of the forest. He must start in the small hours, and be somewhere on the Machray boundary when Lamancha was beginning operations. There lay the most obvious danger-point, and there the navvies would probably be thickest on the ground. At all costs their attention—and that of any Haripol gillies in that quarter—must be diverted from what might be happening in the Sanctuary. This was admittedly a hard duty, but Leithen was willing to undertake it. He was not greatly afraid of the navvies, who are a stiff-jointed race, but the Haripol gillies were another matter. 'You simply must not get caught,' Lamancha told him. 'Make a bee-line north to Machray and Glenaicill—the gillies won't be keen to be drawn too far away from Haripol. You won the school mile in your youth, and you're always in training. Hang it all, you ought to be able to keep Claybody's fellows on the run. I never yet knew a gillie quick on his feet.'

'That's a pre-war notion,' said Palliser-Yeates. 'Some of the young fellows are uncommon spry. Ned may win all right, but it won't be by much of a margin.'

The last point for decision was the transport of the stag. The moor-road from Crask was possible for a light car with a high clearance, and it was arranged that Archie should take the Ford by that route and wait in cover on the Crask side of the Doran. It was a long pull from the Beallach to the stream, but there were tributary ravines where the cover was good—always presuming that Palliser-Yeates had decoyed away the navy guard.

'Here's the lay-out, then,' said Lamancha at last. 'Wattie and I get into the Sanctuary as best we can and try for a stag. If we get him, we bring him through the Beallach; John views us, and shows himself, and draws off the navvies, whom we assume to be few at that point. Then we drag the beast down to the Doran, and sling it into Archie's car. Meanwhile Ned is on the other side of the forest, doing his damndest to keep Macnicol busy. . . . That's about the best we can do, but I

needn't point out to you that every minute we're taking the most almighty chances. We may never get a shot. Macnicol may be in full cry after us long before we reach the Beallach. The navvies may refuse to be diverted by John, or may come back before we get near Archie's car. Ned may pipe to heedless ears, or, worse still, he may be nobbled and lugged off to the Haripol dungeons. It's no good looking for trouble before it comes, but I can see that there's a big bank of it waiting for us. What really frightens me is Macnicol and the gillies at the Sanctuary itself. This weather is in our favour, but even then I don't see how they can miss hearing our shot, and that, of course, puts the lid on it.'

A time-table was drawn up after much discussion. Leithen was to start for Machray at 3 A.M., and be in position about eight. Lamancha and Wattie about the latter hour would be attempting to enter the Sanctuary by the Beallach. Palliser-Yeates should be at his post not later than nine, and Archie with the car should reach the Doran by ten. The hour of subsequent happenings depended upon fate; the thing might be over for good or ill by noon, or it might drag on till midnight.

When the last arrangements had been settled, Lamancha squared his back against the mantelpiece and looked round on the company. 'Of course we're all blazing idiots. The whole thing is insanity—but we've done the best we can in the way of preparation. The great thing is for each of us to keep his wits about him and use them, for everything may go the opposite way to what we think. There's no "according to Cocker" in this game.'

Archie was wrinkling his brows. 'It's all dashed ingenious, Charles, but do you think you have any chance?'

'Frankly, I don't,' was the answer. 'The best we can hope for is to fail without being detected. I think there would be a far away sporting chance, if Macnicol could be tied up. That's what sticks in my gizzard. I don't see how it's possible to get a shot in the Sanctuary without Macnicol spotting it.'

Wattie Lithgow had returned, and caught the last words. He was grinning broadly. 'I'm no' positeeve but that Macnicol will be tied up,' he observed. 'Benjie's here, and he's brought something wi' him.'

He paused for effect.

'It's a dog—a wee, yelpin' dog.'

'Whose dog?'

'Leddy Claybody's. It seems that at Haripol her leddyship wears the breeks—that the gray mare is the better horse there; and it seems that she's fair besottit on that dog. Benjie was sayin' that if it was lost, Macnicol and a'body about the place wad be set lookin' for't, and naething wad be thought of at Haripol till it was fund.'

Archie rose in consternation. 'D'ye mean to say— How on earth did the beast come here?'

'It cam here wi' Benjie. It's fine and comfortable in a box in the stable. . . . I'm no' just clear about what happened afore that, but I think Miss Janet Raden and Benjie gae'd ower to Haripol this afternoon and fund the puir wee beast lost in the wuds.'

Archie did not join in the laughter. His mind held no other emotion than a vast and delighted amazement. The lady, who two days before had striven to lift his life to a higher plane, who had been the sole inspiration of his successful speech of yesterday, was now discovered conspiring with Fish Benjie to steal a pup.

THE WIRELESS LINK WITH AUSTRALIA.

By NORMAN WELLS, M.Sc.

IT may be recalled that as far back as September 1918 the Marconi Station at Carnarvon succeeded in establishing telegraphic communication with Australia, employing for the purpose a 270 horse-power transmitter. At the time this ranked as a great achievement; but while it brought wireless telegraphic communication with the Antipodes to a practical issue, the possibility of speaking over such distances was still considered remote. As often occurs, however, a wholly unexpected means has been opened out through recent researches on the properties of short-waves and the wireless beam.

Following upon preliminary trials of short-wave telegraphy, when morse code messages were sent to Australia with only a fraction of the power previously used, wireless speech experiments were conducted towards the close of May last, from Poldhu in Cornwall. The object was to co-relate information for further work on the wireless beam, more particularly as a transmitter of the human voice. In order to collect the information from as many and as widely separated sources as possible, the beam itself was not employed, broadcast transmission being adopted. This only lends more interest to the present details, and throws light on the amount of work associated with an undertaking of such a nature, where scientific men are carefully building up a new and reliable system of wireless communication.

One peculiar and hitherto unexplored feature that became apparent during this and previous tests was the indication that for short waves the sun's rays affect the energy transferred across the earth's surface in a perfectly definite manner,¹ and it was found that the strength of signals increased as the sun's height decreased, height being of course measured as between transmitting and receiving stations.

Little was expected in May as regards reaching Australia, and the engineers out there were simply asked to stand by on the chance of hearing something, yet during the period of maximum receptive intensity speech was heard

at Sydney with almost uncanny clearness. Owing to the haste with which the Australian engineers had to adapt their apparatus, the aerial employed was 28 metres out of tune, while the receiver was a simple one-valve affair connected to a single stage voice amplifier. In other words the wireless ear was a little dull of hearing, and the receiver voice rather weak and inarticulate. Notwithstanding these drawbacks a sixty-word paragraph from the *Times* read in Cornwall was clearly heard in Sydney, with the trifling exception of four words missing. The importance of this result, under such conditions, may readily be grasped by picturing the effort to telephone a sixty-word message from one room to another in a large building, without any repetition of the first attempt.

On the last day of these tests, when a more sensitive and more powerful receiver was employed, the voice could be heard at several feet distance from the telephones.

Thus was the human voice first transmitted to Australia. Since then much useful work has been accomplished in perfecting the wireless beam and investigating the properties of various wave-lengths.

Another fact of interest is that Australian engineers, not content to remain quietly listening while this work progresses, recently undertook a series of experimental transmissions intended to reach this country. The wave-length employed was 87 metres, and the power less than 1 per cent. of that used at Carnarvon in 1918 when communication was first established. The attempt was confined to transmitting telegraphic messages in the morse alphabet.

During the first few days single morse letters were sent and picked up both by wireless engineers and by amateurs in this country. On Friday, 14th November, at 6.30 p.m., the first complete message was attempted. This message, addressed to the writer, was recorded by the staff at the Marconi Research Station, Hendon, and elsewhere. It was received on the first transmission without difficulty; subsequent transmissions varied from weak audible strength to good audible signals.

These results are highly interesting from an

¹ This was illustrated during the eclipse of the sun on 24th January of the present year.

experimental point of view, though for commercial work the beam system, both in transmission and reception, is imperative. With this system there will be reliability of reception over a given number of hours, unique freedom from interference, low maintenance costs, and high speed transmission of words, all factors which tend to lower the rates charged to the public.

A word on the valve transmitter employed at Poldhu. For the main oscillator two oil-cooled valves were used in a circuit of special design. A total of about 38 horse-power was supplied, of which 24 horse-power created wireless

waves, 11 horse-power impressed speech on these waves, and 3 horse-power were employed in keeping them steady. Probably little more than 19 horse-power were actually radiated from the aerial. That transmission was steady is obvious from the results now described; that it should be so when the number of ether vibrations was over three millions per second is an achievement. Science moves rapidly, and to-morrow we are apt to treat as commonplace results which to-day are so painfully claimed from the unknown—all honour to Senator Marconi and those who labour with him.

A COUNTER-ATTRACTION.

CHAPTER IV.—*continued.*

II.

HARRY jammed on his hat and left the house, walking furiously—he didn't care where. He was dazed and angry, and violent exercise might clear his brain.

So he was to be stripped naked, and thrown to the wolves, was he? Why? How had it come about?

It wasn't as if he had married—or was even sure that . . . Hang it all, where was Rose hiding? He'd find her—he must—and marry her out of hand; then his father could do just what he pleased. He wouldn't care then. He'd march in upon his father, bold as brass, head erect, chest thrown out—yes, just like this!—with Rose on his arm, trembling a little, perhaps, but brave—she'd draw courage from him—with eyes shining like stars. 'Father, this is my wife! Nothing can separate us now! I ask nothing from you; secure in our love—'

No, that wouldn't do. Too melodramatic. Something like this: 'My dear father, allow me to introduce Mrs Harry Rotherton. I am well aware that having taken matters into my own hands, I have no further claim upon your generosity. It may interest you to know that I have already secured an appointment as—what exactly? Well, that could wait—a lucrative post, and we shall always be pleased to welcome you to our humble dwelling'—no—'our modest home, at any—'

'Steady on, guv'nor! That bus was nearly a'top of ye!' He was jerked roughly from the clouds to the kerb-stone by the hand of a passing navvy. 'Taint safe to try an' cross Piccadilly, when ye're all lit up like that.' His preserver eyed him enviously. 'Where d'ye get it, this time o' day? Pubs don't open till eleven. Best go an' sit in the park for a bit. Wish I'd got the price—'

Half-a-crown changed hands, and Harry, deflated, took the advice tendered him. Piccadilly,

at 10.30 A.M., was certainly not the place to rehearse private theatricals.

The exalted mood had passed; he could see no gleam of light through the cloud of gloom that wrapped him about. Even if he could carry out his programme, what would his father do? Probably pat him on the back, tell him he admired his pluck, and ask them to stay to lunch.

Then a horrid doubt crept into his mind. What about Rose? Was he chasing a rainbow? Perhaps, after all, she cared nothing for him. Perhaps, even, she was married to some one else by this time! Well, in that case, nothing mattered. They could marry him to whom they liked. Irene—no, not Irene; he liked her too well—that American girl with a voice like a dinner-gong with a cold in its head; she'd do.

Oh, damn!

III.

The possibility, once admitted, soon became a probability, then a practical certainty, and by Saturday Harry was a misogynist, definitely and finally, practising a cynical sneer before the looking-glass every morning, for use whenever women were mentioned. He'd done with them!

He was in his room, putting the finishing-touches to his toilet, and steeling his soul for the coming interview with his father when Rose arrived.

She had received no further light on the situation, and during the week had been much exercised in her mind as to how to act. Once, indeed, she had written a letter to Lady Rotherton explaining fully her present position, and apologising for the misunderstanding, and torn it up at the last moment, thereby sacrificing a threehalfpenny stamp that had dried on.

She wouldn't apologise! Sir William knew the facts, and could tell his wife if he liked. Perhaps he wanted to see her for some purpose of his own—she hardly dared conjecture what—but if they dared to patronise her . . .!

It was therefore rather on the defensive that she entered the drawing-room, but there was no hint of condescension in Lady Rotherton's attitude.

'My dear, I'm so pleased you could come early. I told you seven o'clock, as I wanted you all to myself for half-an-hour. Sir William has only just come in. You must tell me all about yourself. You used to know Harry quite well, I believe?'

'We used to meet frequently at Seagrove Court, Lady Rotherton. We played tennis together a great deal. I've given up playing lately.'

'So sensible of you, dear. The present-day style—for girls—so very—well—unrestrained, you know. Harry still plays occasionally. I'm so anxious about him; he has changed so much lately. If only he would tell me what is troubling him; but you know we mothers have to take a back seat when our sons grow up, and his father is so stern with him that I'm afraid—'

Her fear remained unspoken; a servant entered the room. 'Sir William would be obliged if you could speak to him for a moment in the library, my lady.'

'What a nuisance! You won't mind being left alone for a minute, dear? Sir William gets so cross if he is kept waiting. I shall not be long.'

Lady Rotherton's 'minute' proved to be one of extreme endurance and tenacity. Rose, after a while, grew tired of sitting upright on the corner of a couch, posing as one to whom time had no meaning. She picked up a magazine, and settled herself in an arm-chair. Was Sir William making eleventh-hour disclosures? It was improbable. The big pot would hardly dare blacken the little kettle at this stage; the *tu quoque* retort would be too obvious. Anyway, she didn't care.

IV.

Harry, blissfully unconscious that an alien member of the hated sex had invaded the sanctuary—his mother, having found him recalcitrant on other occasions, had carefully concealed the fact—descended the stairs shortly before the dinner-hour with his misogyny working overtime. The sneer he had found rather difficult, being clean-shaven. A dark moustache with the ends waxed upward is almost essential to the finished cynic, although, by wrinkling his nostrils slightly, as though he detected something wrong with the drains, and turning his lips up at the corners with his mouth shut, he managed fairly well, for an amateur.

It takes time for the lines to set permanently, however, and when he strolled into the drawing-room, expecting to find his mother there, he was brought up all standing. There was no room on his face for any expression save blank amazement.

Rose, abandoning her magazine detective just as he was being polite to an imbecile policeman, on hearing the door open, had risen to her feet with a sweet smile, prepared to receive her hostess's apologies. She was equally surprised, but showed it less. For a moment she paled, then her colour and courage returned, and the smile altered its character to one of frosty politeness. 'How do you do, Mr Rotherton? I understood you were out of town. I am very pleased to meet you again after all these years.'

'That's right, Rose! Hit a fellow when he's down! Say "How you've grown," and be done with it.'

'Well, you have, haven't you? In worldly wisdom, at any rate, I hope. We were only children.'

'We were nothing of the sort. You were nineteen, and I was twenty-one. And if you think you can stand me off like this, you're mistaken. I've been scouring London to find you. I don't know how you got here, but—'

'Really, Mr Rotherton, I scarcely understand you. Why should you expect to find me among the scourgings of London? I "got here," as you so elegantly express it, by the invitation of Lady Rotherton.'

'That's it! Twist everything I say into something I didn't mean. Well, if you really want to "part brass-rags"—'

He stiffened, bowed ceremoniously, and turned to leave the room. At the door he spun round sharply; in the depths of a concave mirror that hung above the lintel he had caught a glimpse of a very different Rose to the thorny young lady who had given him his *congé*. In a few strides he was across the room, and before she had time again to don her prickly armour, she was in his arms.

They neither saw nor heard Sir William as he opened the door—and quietly closed it again without entering.

V.

Rose soon found her strength again. 'It's all wrong, Harry,' she said, as she struggled free. 'It's no use pretending I don't care; but can't you see—don't you understand—'

'No, I don't. You are going to marry me. I don't understand anything else.'

'Honestly, Harry, neither do I. And I'm not. I haven't said so. There's your father and mother—'

'And "His sisters and his cousins and his aunts,"' he chanted gaily. 'No good, Rose! They're not on in this act. Besides, father has turned me down already. I'm to be cut off with a shilling, and turned out of doors. Can't think why the mater asked you here to-night—unless it's to witness the ceremony.'

'Whatever for? Have you quarrelled with him?'

'Bless you, no! It isn't done. One can't quarrel with the governor, somehow.'

'Then why——?'

'Oh, I don't know. I merely said that a man must live his own life—or did he say that? We agreed, anyhow, and he told me what a fine fellow I was, and he wouldn't pauperise me with an allowance any longer. I could marry whom I liked, and he'd stock a green-grocer's shop for us, or something. "Drop in when you're passing," don't you know, and all that sort of thing.'

'When was this?'

'Tuesday morning. Haven't seen him since.'

The look of distress faded from her face, and she turned to the puzzled young man with shining eyes. 'Your father is a cleverer man than you will ever be, Harry. I begin to see daylight.'

'Better eyes than I have, then. I wonder where—By Jove! I was to meet him in the library before dinner, and you've driven it clean out of my head. He will be furious. Come along.'

'Coward! You would shelter behind a woman's skirt! No, thank you.'

'Rot. If you won't walk, I'll carry you. I'm going to show him the future green-groceress.'

'You are taking a deal for granted, young man,' she returned, laughing.

Nevertheless she did not require carrying to the torture chamber, neither did she appear to fear very greatly the wrath of the Grand Inquisitor.

VI.

Sir William was seated before a table spread with ominous-looking documents.

'I must apologise for intruding upon a business interview, Sir William,' began Rose, anticipating the heroic speech that was trembling on Harry's lips; 'but I think you should know at once that your impulsive son has just honoured me with a proposal of marriage.'

'Huh! Hot-headed fool! And you?'

'I, of course, have refused him—provisionally.'

'Want to know what provision he can make for you, eh?'

Rose flushed, and began to look dangerous.

'Always said you were a sensible girl,' he continued, with twinkling eyes. 'Well, if you

like to stop, you'll hear.' He rose and placed a chair for her, and turned to his son. 'Now, Harry, business. When you've signed this paper, you will be free to go your own way. I shall take no further responsibility. At the same time, we shall always be pleased to see you, and this young lady, if she decides eventually to withdraw her "provisional refusal."'

Harry seized a pen, and was about to scrawl his signature in the space provided, when his father stopped him. 'Bad business, Harry. Never sign a paper you haven't read.'

'I don't need to read it, sir. Nothing you can say or do will alter my—my—what the——'

His voice trailed off as his eye caught a sentence near the end. He turned back to the beginning, and floundered through it, then looked at his father, bewildered.

'But—but—I thought you meant—I thought——'

'Sorry if the lawyers haven't made my meaning clear. You want to marry, and live your own life. Quite right, too. Now you can't live on your pay; nor would any girl of spirit marry a man dependent on his father. You agree with me, Miss Maddison? Thank you. Therefore I propose to discontinue your allowance.' He paused for a dramatic moment, then continued, 'On the other hand, I propose to transfer to you on your marriage half my interest in Rotherton Ltd., provided that your choice is one that I approve. That's the plain English of it. Now, what have you to say?'

'Only that my choice is already made, sir, whether you approve of it or not.'

'Gently, my boy. It takes two to make a bargain. I must deal with Miss Maddison; she is the better business man of the two, and goodness knows you require a business-like wife to keep you straight.—Now, Miss Maddison. Do these conditions dispose of your "provisional" objections? It is true that he still remains the son of a retail tradesman, as he reminded me not long ago, but if you are prepared to waive that point. . . . Steady, my dear! I suppose that means that the objections are removed, or you would not take so great a liberty. . . . Now, if you will kindly remove yourself from the arm of my chair. . . .'

THE END.

THE MONTH: SCIENCE AND ARTS.

VISIBLE AIR-WHISTLES FOR MOTOR-SHIPS.

EVERY steamship and every motor-ship is provided with a whistle or a siren to announce her approach, and to make important signals of her intentions for the benefit of vessels near her. These signals consist of one, two, or

three short blasts or toots, indicating respectively that the vessel is steering to starboard or to port, or that her engines are going full speed astern. For motor-ships the most convenient plan is to blow the whistles or sirens by means of compressed air, of which there is always a store for starting the engines; and so far as

sound is concerned, compressed air is just as effective as steam. But there are occasions when even loud signals can be heard only faintly, or when it is difficult to tell from which of several ships they proceed. In the Thames estuary and other crowded waterways a number of vessels may be passing in both directions in a strong wind, and near enough to each other to demand sound-signals to remove the risk of collisions. The sounds of the blasts will not travel far against the wind; hence the signals from a vessel close at hand may be fainter than those from another farther away. In such cases the steam signals can be read by the puffs of steam, which is a great help; but the compressed air signals are invisible. To overcome this difficulty a simple vapour-forming device has been invented which gives a puff of smoke when an air-signal is sounded. A liquid, tin tetra-chloride, is stored in a cylinder, from which a pipe passes upward through a vaporising nozzle. When the whistle-valve is opened, it admits compressed-air to this pipe as well as to the whistle, with the result that a small quantity of the liquid is drawn up and converted into a dense white vapour, which issues from a pipe close to the whistle. The cylinder holds four quarts of the smoke-forming liquid, which is enough for 900 two-second signals.

AN IDEAL CLIP FOR HOSE CONNECTIONS.

Every chauffeur, and every motorist who keeps his own car in order, has to connect and disconnect rubber hose-joints on the water-piping. These were originally secured with copper wire. More recently clips have been introduced, which have greatly expedited the connecting process. A very ingenious clip that possesses distinct advantages over previous types has lately been placed on the market. It is based on the worm and worm-wheel principle. The clip itself consists of a strip of galvanised steel. This is fitted at one end with a bent steel stamping that houses a tiny worm having a square thread. Teeth to match the thread on the worm are cut in the strip over nearly half its length. These are formed by cutting a series of grooves in the middle of the strip with a revolving cutter of the same shape as the worm. The bottoms of the grooves, therefore, are circular arcs, which come out near each side of the strip. A screw-driver head at one end of the worm and a collar at the other prevent any end movement. When a clip is placed in position, the end is pushed into the stamping, under the worm, which is turned with a screw-driver, the thread of the worm taking hold of the teeth and drawing in the end of the clip with great power. The fitting which carries the worm is stamped out of galvanised steel, and the worm itself is galvanised, so that no part can rust. It will have been noticed that one clip may be made to close down on a

range of sizes of hose. It is simply a question of how far the end of the clip is screwed through the worm. No. 1 size, for instance, will fit hose $\frac{7}{8}$ th to $1\frac{1}{2}$ inch in diameter, and only four sizes are required up to $3\frac{1}{4}$ inches in diameter. This clip has such power that the thickest hose can be closed down on to pipes much smaller than the inside of the hose. Nothing can go wrong with the clip; the worm-fitting is secured in such a way that it cannot pull off, while the worm-thread and the teeth in the strip are square and of great strength. In fact, we have tightened one of these clips up with a screw-driver as far as it would turn, without discovering any signs of weakness. The nick in the worm's head is wide enough to take a coin if a screw-driver is not handy, a sixpence being all that is required. In addition to serving as clips for hose connections, several of these devices can be joined together and used for compressing piston-rings when entering them into a cylinder, and for similar purposes.

ELECTRICITY FROM WIND-POWER.

From time to time reference has been made in these notes to devices for utilising the power of the wind for the electric lighting of houses. The last note dealing with this subject occurred in the Christmas Number for 1921, when a system was described which consisted of a row of combined windmills and dynamos of small power. A new form of wind-dynamo which has been developed in Germany is reminiscent of these small machines in that both windmill and dynamo are mounted together on high masts. But the latest type is very much larger, while two interesting improvements are embodied. One is the fixing of the windmill at the rear of the combination, so that it sets itself facing the wind without requiring a tail; the other is the addition of a brake vane to each sail or blade, which is normally held by a spring in the direction of rotation, and therefore offers no resistance. Should, however, the revolutions per minute approach the danger-point in high winds, these vanes are swung out by centrifugal force, and prevent any further increase of speed. The dynamo is housed in a weatherproof, stream-lined case, and it is driven through multiplying gear, as the windmill, which measures 28 feet across the tips of the blades, turns but slowly. Both windmill and dynamo are mounted on a reinforced-concrete mast, 30 feet high, with a swivel bearing at the top, which allows the combination to move round to suit changes of wind. Four blades have been adopted for the windmill, and their shape, according to Mr A. J. V. Underwood, M.Sc., who recently described this wind-dynamo in the *Electrical Review*, has been arrived at after considerable experimental work on various forms in a wind tunnel. The electrical equipment is similar to that usual in small installations, a

battery being provided of sufficient size to keep up the supply of electricity during calms. This is charged so soon as the voltage of the dynamo exceeds that of the battery, the circuit being made and broken by an automatic device according to the speed of the windmill. Tests of this apparatus made near Berlin show that 12 horsepower is developed in a wind of 11 miles per hour; but when the velocity of the wind increases beyond 18 miles per hour the brake vanes come into action and limit the horsepower to 14. One of these outfits is to be installed by the Oxford Institute of Agricultural Engineering at Harpenden.

A DEEP-DIVING SUIT.

Although diving has been carried on at depths of over 200 feet, 150 feet is considered to be the limit for practical work. Even at that depth a diver can stay down for only short periods. In the ordinary diving suit the diver's body and the air he breathes are subject to the pressure due to the depth of water above him, this amounting to 43 pounds per square inch for every foot, or 65 pounds for 150 feet. A German named Gall has recently invented diving armour in which the diver is entirely protected from the pressure of the water, while he carries means for purifying the air inside, so that a supply from the surface is unnecessary. The usual helmet is extended into quite a big cylindrical compartment with a domed top, in which the head and trunk of the diver can move about with freedom. This compartment is made of steel plate, and the upper half can be removed to give access to the diver. Branching off from it are articulated tubes for the arms and hands and for the legs and feet, thus affording complete protection from the water pressure. Three articulations of the ball and socket type correspond with the three joints in each limb. In the upper part of the compartment are fitted three enormously thick glass ports at the level of the diver's head—a big one in front, and a smaller one at each side. A fourth port admits light well above him. Outside and just below the domed top are fixed two buoyancy tanks in the form of half-rings, which communicate with side-tanks at a lower level. The side-tanks have outlets at the bottom, while the ring-tanks have valves at the top which are normally open, but can be closed by the diver. In the ordinary course these tanks are full of water, but in cases of emergency the diver closes the valves and connects an oxygen cylinder, when the pressure blows out the water through the outlets in the bottom of the side-tanks. The result is that he immediately rises to the surface. Otherwise he is pulled up by a wire rope attached to the dome. Incidentally this rope is so secured that it can be released by the diver should it become entangled in wreckage. Seven oxygen cylinders are mounted on the outside of the body com-

partment under the buoyancy tanks. These are provided with reducing valves and a connection to the inside, where oxygen can be admitted by the diver as required. Outside connections are taken to the buoyancy tanks through valves that can be opened from the inside. A breathing mask is furnished, and connected by a hose to a breathing cartridge, which absorbs the carbon dioxide in the breath. Mounted within reach of the diver are a telephone, a depth-gauge, a compass, a barometer, a thermometer, and the various valves for the control of the oxygen. The tubes for the arms and hands terminate in nippers, which are worked from the inside through water-tight joints. Experiments with this suit have been made in the Walchensee, during which a diver descended to a depth of over 500 feet without suffering any discomfort; but it was quite dark, and the arm-joints were very stiff, owing to the enormous pressure. Another descent was made by an engineer who had never been down before. At a depth of 350 feet he attached a spring hook to a heavy object which had been sunk to provide this test. The diver was down for twenty-nine minutes, and the engineer for twenty-one minutes. At previous tank tests divers remained under a pressure equal to a depth of 279 feet for periods of five hours.

A HAND WIRELESS TRANSMITTER FOR LIFEBOATS.

It is difficult to over-estimate the advantages of wireless outfits for the lifeboats carried by ocean-going ships. A compact transmitting and receiving apparatus for lifeboats formed the subject of one of these notes in our issue for May 1924. It may be remembered that a direction-finding device was included, and that current for transmitting was derived from a small dynamo driven by a petrol motor. Excellent as these outfits are for large lifeboats, especially those fitted with motors for propulsion, the installation of one in every lifeboat could not be contemplated, owing to the high cost, the space occupied, and the need for a trained operator. A small hand-worked transmitter recently originated by a well-known electrical engineer in collaboration with the Wireless Research Department of the Air Ministry is a very much smaller and simpler outfit that might well form a part of each lifeboat's equipment. The distinguishing feature of this wireless transmitting set is that anyone can work it, the mere turning of the handle causing a pre-arranged signal to be sent out. This may, and probably will, consist of a distress signal, followed by the call letters of the ship to which the boat belongs, and the number of the boat. The machine will keep on repeating these signals so long as the handle is turned. Contained in a waterproof teak-box measuring $11\frac{1}{2}$ inches by 9 inches by 11 inches, the outfit consists of a tiny alternator

with a 'spark-gap' transmitting device, which is driven by the handle at a high speed through the medium of multiplying gear. Slowly rotated by the mechanism is a disc which repeats the signals at each revolution, notches round the periphery operating the dots and dashes. Tuning devices are mounted in the case, and the wave-length chosen is that in general use by ships. With an aerial carried on two masts, and of quite moderate height and length, the range is about 60 miles. A very useful feature of the apparatus is that whereby the current produced by turning the handle is diverted to a lamp (fixed on one of the masts), which lights up the boat and serves as a guide to other boats or to vessels coming to the rescue. It has been found by experiment that by turning the handle an average man can easily light a fifty candle-power lamp, which would be visible for several miles. Not only are these simple wireless transmitters of value for lifeboats, but they have been approved by the Air Ministry for aeroplanes, while the Mines Department has them under consideration.

A NEW LUGGAGE-TRAILER FOR TOURING-CARS.

Every motorist will readily admit the advantages of a luggage-trailer for long tours; this accessory can also be used for carrying all kinds of goods for shorter distances. The ordinary two-wheeled trailer is satisfactory enough when one is going ahead; but it makes manœuvring in the reverse almost impossible without practice. A great improvement on this type is a trailer with a single castor-wheel. It is connected to each side of the car-chassis at the front end by hinges which allow of vertical motion only. When a car with this trailer is reversed, the wheel swivels round like the castors on a piece of furniture. In fact, the driver can safely forget the trailer entirely whether manœuvring ahead or in reverse. Fittings are supplied with each trailer for attachment to any car, and these are of a type that allows of quickly coupling or uncoupling the trailer. The frame of the trailer consists of a steel channel-bar in the form of a U, which passes along the bottom at each side and across the rear end. Extensions of this frame at the front end connect to the fittings on the chassis of the car, being secured by hand-screws. The body of the trailer is built of steel plate, the back being reinforced to take the spring-fittings for the castor-wheel. Four leaf-springs, two at the top and two at the bottom, in the form of a V with the apex to the rear, support the head of the wheel-fork and give ample resiliency, while the front end springs with the chassis. The body is fitted with a black canvas waterproof cover with straps and fittings, or with a fixed metal top and a door at the side. It is narrow and deep rather than wide and flat, and, being narrower than the car, is not liable to foul other traffic. The

wheel is fitted with ball-bearings and a Michelin Comfort tire. Two and a half hundredweight are carried by the smallest trailer, and ten hundredweight by the largest.

A PORTABLE OPEN FIRE.

Pleasant as everyone admits the open fire to be, few will urge high efficiency as one of its advantages. Recent tests give 33 per cent. of the heat from the burning fuel as the maximum that is utilised in heating a room, although some of the remainder passes into other parts of the house from the chimney. One reason why the open fire is so wasteful is that it is tucked away under a mantelpiece, where only the heat radiated to the front can escape into the room; another is that, at least where wide and shallow, it will not burn coke. A good deal can be said in favour of a recently-invented portable open fire which is placed in front of the ordinary fireplace. This device is in the form of a rectangular stove with bars in front, and with the back curved over to an outlet flue, which directs the smoke into the chimney. An opening above the fire gives the open effect so beloved of the inhabitants of these islands, while a cover over this opening draws the fire up when first lit. The fireplace stands in an ash-tray with louvres, and is fitted with a handle at each side, by which it can be carried from one room to another even when alight. With this device much more of the heat from the burning coal is utilised in heating the room than with an ordinary open fire, the sides and the back being especially effective in giving a constant upward flow of warm air. Whether the claim of the makers that double the heat is obtained from half the coal can be substantiated we are not in a position to determine, but there is not the slightest doubt that a big saving in fuel is effected by these portable fireplaces. Moreover, the fire being deep, coke can be burnt without difficulty.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, Chambers's Journal, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

. TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, Chambers's Journal, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

AT PILL'S AUCTION.

PART II.

IX.

PILL'S Auction Rooms informed him that the bureau with the library chair he had bought and an oak stool had been sent to the rooms by a Mr R. Westway of 29, Davenport Crescent; and had been, they believed, a legacy.

'Duke read the letter several times. He said then to Gilchrist, 'There's an affair here I must attend to at once. You can deal with any matters we've arranged; if anyone drops in whom I ought to see, keep things going till I get back. I daresay I sha'n't be long.'

He departed; again the day was sunshiny.

'Duke knew Davenport Crescent through having passed it fairly often on a 'bus. It was a spot that had once been aristocratic and was now shabby-genteel. The folk who lived there were, 'Duke rather imagined, of the same order. He thought, 'Daresay this Westway chap will be pleased to hear about that little matter of five hundred pounds.'

No. 29 proved to be an apartment-house. An assortment of bells met 'Duke's eyes. He looked about, found one marked 'Westway' in neat, small letters, and rang. At the same moment the door opened and a girl appeared bearing a saucer and a number of dusters; she almost fell over 'Duke, and his colour rose. 'Hullo,' he said.

Bob's colour—for Bob it was—had risen too. But she looked at him with calm eyes and asked, 'What do you want?'

'A cold, cruel question,' commented 'Duke; but added hastily—'Not *you*, so don't get worried; I'm after a Mr R. Westway.'

Suddenly she laughed.

'What's funny?' asked 'Duke severely. He added, 'Er—have we been introduced?'

She laughed again. 'Let me introduce myself—I am Mr R. Westway. Anyway, I'm the only R. Westway that lives here.'

'Spose I'll have to make you do,' said 'Duke with seeming reluctance.

'If I let you,' said she pointedly.

'Duke felt in his pocket. 'It's real business. I have a letter from Pill's Auction Rooms. . . .'

She looked just a trifle worried. 'You haven't been making trouble?'

'Good Lord, no!' exclaimed 'Duke, horrified. 'What do you take me for? Besides, what was there to make trouble about?'

She glanced at him roguishly. 'Why, nothing.'

'Nothing at all,' agreed 'Duke.

'Are you in a dreadful hurry?' she asked him.

'A slack morning; absolutely nothing to do,' 'Duke told her. It was a pity the busy Gilchrist could not hear him.

'Because,' Bob said, matter-of-factly, 'I brought these dusters down to clean our bell, and it seems a pity to carry them back again.'

'Without cleaning it? Rather,' said 'Duke. 'Allow me.' He took the dusters from her.

'This is bath-brick in the saucer,' said Bob, smiling at him.

'Splendid stuff,' said 'Duke vaguely. He looked a little helpless.

'You rub the bath-brick on with one duster, and polish it off with the other,' said Bob.

'Oh, I see.'

Bob held the saucer, and he dabbed the duster into it. He began to rub vigorously. 'Splendid exercise; I don't wonder you do the job yourself.'

'As a matter of fact, I don't, usually,' said Bob; 'but the charlady is ill—and there you are.'

X.

The bell shining gorgeously in the sun, they went upstairs. 'Duke found himself in a pretty, simply-furnished room.

'You must wash your hands,' said Bob; and, murmuring something about getting a towel, disappeared.

The pictures on the walls were well-chosen; the furniture, if inexpensive, showed good taste. 'I suppose the two of them live here, and furnished the place themselves,' thought 'Duke.

In a corner was an ordinary clothes-basket filled with a heterogeneous mass of picture-postcards, old letters, empty match-boxes, and ends of sealing-wax. 'Duke gazed at it in a fascinated way; it was singularly out of keeping with the refinement of the room.

When he had washed his hands, and was back in the sitting-room, Bob faced him with a question. 'You said you came on business? I'm simply dying to know what it is.'

'Please sit down,' said 'Duke. He went on, 'That bureau—'

Bob cried with a wail, 'You're not going to say that you don't like it; don't want to keep it!'

'Heavens! no,' said 'Duke. 'Why, I wouldn't give up that bureau, not for anything. But was it really yours?'

Bob nodded. She considered for a moment, laughed, then said, in rather a shamefaced way, 'It was left to us by an aunt; to Madge and me, I mean. Madge is my sister. She was with me last week. You remember . . . ?'

'I do, indeed,' said 'Duke, ruefully. 'She ran the chair up.'

Bob had the grace to blush. She went on quickly, 'That was ours, too. Aunt Susan left us three things—a little oak stool, that library chair, and the bureau and all it contained—'

'Hurrah!' broke in 'Duke, and slapped his knee.

'There wasn't anything in the bureau to hurrah about,' said Bob. 'Only the rubbish in that basket. We've looked through it; there's nothing that matters.'

'Duke leant towards her. 'You didn't know,' he asked impressively, 'that there was a secret drawer?'

Bob was startled. 'A secret drawer—why, no!'

'Well, there is one,' said 'Duke, in the same impressive tone. 'I found it. That is what I have come about. You see, the secret drawer was not empty.'

She gazed at him breathlessly, but could say nothing.

'What was in it?' said 'Duke, as if she had asked the question. 'Why, nothing. A mere matter of five hundred pounds.'

Bob collapsed into her chair. Then she dashed from it, seized 'Duke by the shoulders, shook him frenziedly. 'What was that you said? Say it again!'

'Is your sister anywhere about?' asked 'Duke. 'I should like her to know that I am being ill-used.'

But, almost in tears, she gave him another shake. 'Madge is at the sea. Did you say—?'

'I said there were five hundred pounds in the secret drawer,' said 'Duke, with composure; 'and so there was.' She freed him. 'Thank you,' said 'Duke. 'It was hard to retain one's calm while that was going on; but I flatter myself I managed it. Here is the money.' He brought from his pocket an envelope and handed it to her.

Bob tore the notes from the envelope, pushed them back again. She looked at 'Duke. 'You sweet thing!'

'If you will say that to me again later on,' he suggested modestly, 'when you know me better.'

XI.

A few minutes later, when she had recovered herself, Bob said wistfully, 'I wish we hadn't run you up over the bureau and the chair; but, you see—well, we were so badly off. . . .'

'I think I begin to see a glimmering of light,' 'Duke said, with an attempt at carelessness. 'Don't tell me, if you think you'll wish later on that you hadn't.'

'Oh, I sha'n't,' said Bob. She nodded her pretty head firmly. 'It was all my doing,' she

said. 'I wrote to the auctioneer. I let him think I was a man, because—because—well, people try to cheat girls sometimes.'

'No, no,' said 'Duke.

'Oh yes, but they do,' said she. 'Besides, you mustn't interrupt. I asked him to put the three things up separately; I thought we'd get more for them like that. Then Madge and I went to the sale. It was my idea that we should bid and help to put the price up. I said to Madge 't would be a joke; but I wanted to get enough for her to go to the sea—she hasn't been a bit well—and a bit over. I knew unless there was some money over she wouldn't go.'

'Duke said gently, 'I see. And she has gone.'

'Yes, she has.'

Bob clasped her hands. 'I say, when she hears about this!—what will she say? And you have been so decent . . . some people wouldn't—'

'Oh, anybody would,' said 'Duke.

Bob said shyly, 'I don't see how we are ever to thank you.'

She was upset still, and he ought to be going. 'Duke said, 'Oh, well, ask me to tea some day, and we can talk about—auctions.'

'You're horrid, but a dear,' said Bob.

XII.

Not so *very* long after, they were looking at the bureau together.

Bob insisted on finding, by herself, the secret drawer. It was a long business, but 'Duke did not seem to tire of watching her at it.

When found, the drawer was discovered to contain the catalogue of an auction. Bob blushed, but took it out, and with a demure face ruffled the leaves.

'Please may I borrow your catalogue?' 'Duke asked winningly.

Bob pursed her lips, her blue eyes dancing. 'Er—have we been introduced?'

'A pore young man what loves you,' said 'Duke, introducing himself; 'a honest young man what returns money he finds; your future husband. Is that right?'

As he kissed her over the catalogue, it's to be supposed that it was.

THE END.

THE LILACS.

WHY do the lilacs every Spring
Hold in their honeyed breath a sting?
To-day their plumes of amethyst
Sway in the languid breeze, sun-kissed;
And I, who used to love them so,
Weep, and the why, I scarcely know.

But oh! their haunting perfume seems
To stir the dust of long-dead dreams!

Chambers's Journal

SEVENTH SERIES

THE YELLOW FIELD.

By G. APPLEBY TERRILL.

PART I.

I.

I HAD stopped running; I was walking at slowest pace, dragging my stocking feet through the wet grass and flowers, when I came to the brim of the hollow.

I was panting and labouring to get breath; my eyes were full of tears from my labouring, and, for many minutes past, sight had much left them, owing to my exhaustion. When, at times, I cast my head backward I could see, as through dimness, the blue of the sky; when I drooped my head forward I could see yellowness where my foot trod, as though the grass were very thick with yellow flowers; but of what was around me I discerned nothing—I was conscious only of dimness, with black bars starting athwart it now and again as a sign that I was very near to swooning.

I knew not that I was come to a hollow until I lay, fallen upon my elbow, on its brim. My foot had slid over the brim, and 'twas from my effort to keep from falling—I could not tell whither—that I had fallen thus; and after I had lain for a little space, my eyes cleared, and I saw the hollow below me in the sunshine.

My brain, as yet, did not clear. By which I mean that I was still very light of the head, with no power to reason properly—to such a state had I been brought by fear and desperate running, and by a deep ebb of my strength from the bleeding of the place, a little above my right hip, where the musketoon ball had furrowed me.

Had my senses been in their right condition I now should have laid myself high on the slope of the hollow, with my face scarce above its rim, and watched through the grasses and flowers (sweeping glances all round me at times) for a distant sight of my pursuers, while I sought, by resting my body thus, to gain some little strength to run farther.

But, instead, I acted in the foolish way, which was well-nigh certain to deprive me of any shred of chance of saving myself that might remain. Getting to my feet, I went stumblingly, slippingly, down the slope to the floor of the hollow; then limped an hundred paces across

the floor to where a high, dense mass of green water-spears stood up from a marshy pool, my thought being that I would hide myself in the midst of these. I skirted the water-spears, looking for some thinness or gap through which I might enter without leaving a crushed passage to betray me—and it came not to my mind that when they who were after me caught sight of these spears they would, as a natural course, descend straightway to search them.

I saw a gap—doubtless forced by drinking cattle—the crushed spears which enframed it decayed and gray, vouching that they had been crushed long ere this morning. With that, deeming vaguely that my enemies were not yet drawn close, and seeing no need to go breast-high in water and slime at once—though verily 'twas a small thing to hesitate from—I withdrew some yards to firmer ground—for I had been walking in morass—and turned to face the slope I had come down by.

It was wondrously yellow with little field flowers; it rose like a yellow carpet, specked only here and there with green, against the sky. For this was June month, and I was in rich, south English pasture-land, some eight miles west of Hastings town.

June of the late year 1692; a Saturday morning, the last Saturday of the month; the hour being about seven of the clock—such was the time of my standing in the hollow, still panting hard and shaking hard from my last running, and knowing, though dreamily, because of my bemused brain, that I was not much better than a dead man. The water-spears were still fixed in my mind, but already, without being very conscious of it, I was beginning to doubt them. I knew in my heart that 'twas almost beyond possibility that I could escape my enemies; and if I died not in resisting arrest, I very surely should be hanged later for having endeavoured to rob an Admiralty messenger.

It would help me not a whit that my endeavour had been no common, thieving thing, but done to serve my king. Rather would it make my condemnation the surer, since we were in such strange, traitorous times, which witnessed the Prince and Princess of Orange

sitting on the throne of England, instead of King James, who, driven forth from his kingdom by the traitors who had set up the Oranges in his place, now dwelt in exile at St Germain-en-Laye, in France.

I was one of those who served His Majesty by slipping into England from St Germain bearing letters (sometimes in His Majesty's own writing) to divers persons, and slipping out again bearing letters for St Germain.

This letter-post business, which was little interrupted by the war between England and France, was in itself a no more than pleasantly hazardous occupation for a young man, who, stepping into England—most usually at night, from a fisher-boat or a contrabandist—would be in some danger of arrest and imprisonment till he was out of England again, but rarely in peril of being brought to trial for his life, though, as could be expected, such errands as his, which had the bringing back of His Majesty to England as their chiefest object, were looked on as treason by the Prince and Princess of Orange, now called King and Queen of Britain, and (outwardly, at least) by the Privy Council and all the rest of the traitor authorities.

Indeed, there were times—if the government were in a savage humour—when the letter-bearer must lurk and lie low, and let no whisper of his being in England get forth, or he might pay with his life. Yet there were times—if he were carrying back letters from high-placed traitors (perchance members of the Privy Council itself), who were now turning traitors to the Oranges, and writing in friendship to King James—when he could cock his hat in London streets and ride in boldest manner to the coast, knowing that his presence was being winked at from the Privy Council downward. Yet, among those who winked, were many stubborn, bitter foes to His Majesty, who would be fain indeed to spite him by putting to death one who served him, could they find a pretext which would enable them to do this without raising an outcry from all decent Englishmen.

An hour before I came to the hollow I had given such a pretext in full measure; I had let myself be drawn into greatest folly. *Maddest folly*, I named it now, with some gleam of reason reviving in my brain as I stood breathing heavily, quivering, by the green palisade of waterspears.

This present journey of mine to England—my sixth—would have been the safest I had known but for my ruining it at the end. Sailing from Normandy (where His Majesty then was) some three weeks back, and landing in the dusk near Pevensey, I had learned that the government was easy tempered; and anon I had made myself extremely safe by receiving a letter for His Majesty from a high person I will not name. I had arranged to quit England in broadest daylight; for at this season I should

be surer of getting a sailing-breeze by day than at night; and I was confident that no one would seek to trouble me.

In gay spirits had I been, not much above an hour ago, as I came riding along a little bridle-road, not ten miles from the cliff, just west of Hastings, under which my fisher-boat was waiting for me. Though my journey had so lacked peril, it yet was a pleasant thing to find myself passed out of all shadow of danger—as I deemed. Indeed, 'twas blithe to reflect that, not long hence, I should ride—with a knowledge that I had done my work in England fittingly—to the threshold of the house that now was more my home than any place in England—His Majesty's Château of St Germain, with its great woods about it. On the terrace, or in his writing cabinet, His Majesty would receive me, and give me some kind word of approval. After which I should go along the corridors to my mother (one of Her Majesty's ladies), turning the day glad for her, who was ever gravely afraid of my journeys to England; then should I walk with my father, he eager to hear of every mile of my journey—and then, doubtless, should I feel a wish that His Majesty would bid me ride over to the Court of France on some little mission, that I might make my bow to certain of the young French mademoiselles in attendance there—I being four and twenty years of age, and not unmindful to wed some French lady.

Ay, happy were my spirits until, on that bridle-road, I overtook Eves Culloch, who, two days before, had asked to share my boat. Poor Eves, who had been fatal to us both it did seem! Oh, I should have been on my guard against Eves, a man older than myself, but so marred by a witless daring that not often was he entrusted with letters, lest he should find a means to throw away his life for nothing, and his letters be opened by the wrong hands. He was riding his horse at walking pace when I came to him. Instantly drawing to a stand, he told me of a fellow whom he had seen in an ale-house a little way behind us, who was waiting for a fresh horse to be brought him from a farm. An Admiralty express, this fellow was—Eves said—going through from Portsmouth to Margate, thence over to Holland, with papers for the Prince of Orange (now abroad).

'Twould be the prettiest thing—Eves had quoth, examining my face—if we took his papers to St Germain. . . . We would leave him tied up on the roadside. And who should see aught, or know where to look for us? And Eves had moved his head to bid me note our surroundings.

It had rained heavily in the night and since dawn. But now the sun was full out, and his heat, I suppose, had caused a thick white mist to rise and lie over the flat pastures on either side of our road. During the past minutes a breath of air from the west—fair for our voyage—had

been bringing mist to, and over, the road ; so that, whether we looked forth or back, the road disappeared into mist, which grew denser as we looked. Thus we had the favourable stage for the enterprise, and after a minute (folly ! folly !) I let Eves persuade me to it. Whereupon we wheeled our nags, and sat ready to ride slowly towards the express when we heard him coming.

Eves spoke with hearty confidence of how swiftly the fellow would yield at pistol point ; of how nimbly we would tie him with our cravats and a piece of cord which Eves chanced to have ; and stop his mouth with a kerchief—and be at sea well-nigh before he was found. But, verily, I felt not easy while we waited.

When I had made the Irish campaign with His Majesty, and was sentinel in a gentlemen's troop, I oft had held a man at stand with carbine or pistol, he obeying my every word. But this present affair, though there would be two of us against one, did seem much more difficult to accomplish—I could not decide why, save that, since it was very like common robbery (though a proper act of war against traitors), I should not think to shoot at the express for resisting us ; and I had forced Eves to promise likewise. Moreover, we were two alone in a countryside that must be counted as hostile to us.

It was after we had waited for seven or eight minutes that there reached us, rather of a sudden, some sounds which perchance the mist had deadened hitherto—sounds, from not far behind us, of an approaching farm wain, as we deemed. We could hear the lumbering turn of the wheels in the mud of the narrow road, the tread of heavy horses, and, plainest of all, the whistling of the driver.

To me it seemed that two men were whistling, but Eves, angry with me for saying so, declared no. Almost immediately after, the quick, soft beat of hoofs in mud, from the other direction, betokening the express, reached us, and I, with great misgiving now, quoth to Eves, 'Well?' He answered swiftly that no farm boy was going to stay him from this ; that we should never catch the express if he passed us, he freshly horsed ; and (asked he, sending forward his horse toward the express, now to be seen as a looming patch in the mist) would I follow him or no ?

Whereafter the event had moved quickly to disaster and fatallness.

Eves had pulled a pistol from his saddle ; and I, when I came beside him, took my pistol from under my cloak. The express was in fair sight now, a short-bodied, fat fellow with a very big, red-looking face, having a blue scarf passed over his hat and beneath his chin to keep his hat secure.

I considered that we were showing our weapons too soon ; and yet, with the fellow riding a powerful, white-nosed hunting horse at great pace, 'twas hard to know how we could

pull him up ere he was carried by us, unless we gave him timely warning.

He saw our pistols, and, not waiting for us to level them, ducked forward, with his hat pressed against his horse's neck. And as Eves, raising his pistol, cried to him to stay, he gave us proof that he was a pretty dexterous fellow in his line by letting blaze past his hunter's jowl with a pistol that he must have drawn as he ducked. I felt my nag wilt and half-rear, poor beast, then knew 'twas falling, and knew next that I was lying breast downward in the mud, having pitched heavily, but clear of my shot horse.

I heard Eves fire on the express, and him reply with a second shot, his hunter's hoofs beating wildly the while from its terror at the firing. Then the beating swept close to me, and there came a scuttering and trampling from the hoofs of Eves's horse, then the queer, heavy, windy sound of horses' bodies meeting, and then the furiosest squattering of mud, and trampling. I twisted to my feet, still holding my pistol, which had not discharged in my fall—for I had not set it acock. Eves and the express were at hand fight, each striking with an empty pistol, but neither landing a blow to count, because their scared, kicking beasts would not let them get close. The express had won past Eves now, but, with his big face deepest red from vehemence and anger, puffing, and gabbling smothered words, he was straining back his hunter to keep the fight up—until he saw me rise armed. At that he flung his pistol through the air at me, and missing, gave his hunter his head, and was speeding off. But, alas ! he went not far. Ere the mist could hide him we saw him draw rein ; and then we saw about him the red blurs of soldiers' uniforms, and we knew that the wain we had heard was no farm wain, but an army one, with a guard of soldiers riding on it, three or four of whom had run forward on hearing the first shot.

They had started forward again, at a flying run, out of the mist into clear space.

'Up !' poor Eves had shouted to me, turning his horse full away from them, and holding his hand to aid me mount behind him. Then the soldiers' snaplock musketoons roared out, and a ball smote Eves forward upon his horse's neck, and the animal, as I strove to catch the rein, doubled from me and cantered towards the soldiers, with Eves hanging—held from falling off by some hitch of the harness—killed, I knew.

I saw one of the soldiers stop the horse, with the others reloading, repriming their musketoons, whilst a newcomer of them dropped on his knee and aimed at me with care. I cocked the hammers of my pistol (which had twin barrels), meaning to make these fellows pay for Eves. I felt a tearing blow above my right hip, and knew that the kneeling musketooner had touched me. I fired both barrels of my pistol, getting

one soldier in the leg—nothing more. Then, with two of the musketoons rising to aim at me, I ran from the road into the pasture on the seaward side, seeking the thickest mist, hearing the reports of the musketoons, the hiss of the balls, and discerning, with a backward glance, that the road was lost to sight quicker than I could have hoped. At this I stopped to pull off my riding-boots, and to fling away my cloak and peruke (my hat was already gone) with them. Thus lightened, I sped fast for a while, endeavouring to go toward Hastings, but unable to tell in the mist what direction I was keeping, hearing once or twice the soldiers calling out, somewhat to my left behind me.

My feet were soon in smart pain from thistle pricks and from being bruised by stones which sometimes I struck on, but I scarce noticed this, or cared a jot so long as I was not lamed. I was more concerned by my touch from the musketoon ball; for, though there was no great pain, I felt I was bleeding much, and knew this must weaken me. But my thoughts were chiefly held by sorrow for Eves—very intense, though we had never been warm friends—for the first minutes. After, they were gripped and disordered by my fear of being taken—a fear that quickly began to surpass all natural bounds, becoming a most dreadful apprehension—a terror such as I would not have believed I could ever know. Perchance a great sense of loneliness and death, caused by the manner of my separation from Eves—dead, I was sure—had somewhat to do with this strange cowardice. Perchance the truth is that, being scarce recovered of a fever that had kept me in my bed all March and April, I was not yet staunch enough for true, deadly adventure. I know not, but soon purest terror was driving me forward madly, making me uncaring of whither I was heading.

For half-an-hour I must have run, with few intervals of slackening; and then it came to me that I was no longer in mist but in clear sunshine. Ahead of me, beyond two or three

miles of pasture-flat, was the sea, streaked green and blue. I stopped and looked behind me. I could not see far because of the haziness (to which the mist had thinned) from which I had lately emerged. I had run upward, I discovered, to the top of some rolling ground. Looking next in the direction of Hastings—and finding a good two miles of pasture betwixt me and the wooded hills that Hastings lay some miles beyond—I noted that a stretch of mist still lay over the nearer part of this pasture, where 'twas low ground. I turned to look again at the haze I had run from; but ere my eyes reached it they stopped, and I felt my heart jump horridly, and experienced anew the full grip of my fear, which had eased in the last seconds. I had perceived, about a mile from me, plain in sunlight, the red figures of four soldiers, with half a score darker figures, country persons, helping them in the chase—the whole strung out in a line. I believed that I could distinguish with them the squat form and even the blue scarf of the express—delaying his ride that anon he might take oath of my face.

In the moment that I gazed I could tell that the line was taking a forward curve, from the sudden running of some who had caught sight of me; and straightway, drawing my eyes from it, I ran—ran to the low ground and into the mist—then soon out on the other side of the mist. I ran on for I knew not how many minutes—well nigh for another half-hour, I would say—presently keeping no direction again, but reeling off to right or left as my feet touched marshy ground, of which there were many patches to avoid. Towards the end I was gone almost sightless—running in that dimness whereof I have told. As my head grew light I resolved that I would run, no matter whither, till my heart burst, and thus cheat the chasers. But anon I ceased running—scarce knowing I had ceased—and dragged my feet through the wet grass and flowers, and came to the hollow, on the floor of which I now stood.

ART ASTRAY.

By E. D. CUMING.

I.

INASMUCH as authors draw characters from life, it is at least arguable that painters may do the same. Dickens, as we all know, presented his own father in the guise of Wilkins Micawber, and Leigh Hunt as Mr Harold Skimpole, to mention but two prominent examples of caricature. And if eminent writers of the nineteenth century took these liberties with their relations and friends, we cannot take exception to the licence artists permitted them-

selves in their pictures in days when actions for libel were not to be feared; though we may sometimes be surprised by the method adopted. To make a sacred subject the vehicle of personal vengeance is an action which offends.

In this regard, however, we have to bear in mind that in early days portraiture pure and simple was seldom practised. Art was the handmaid of the Church, and painters devoted themselves very largely to sacred subjects; and if an artist wished to convey a compliment he did it through his picture. Thus, if a wealthy

citizen wished to present an altar-piece to his church, the painter would include therein a portrait of him among the figures represented doing homage to the Virgin and Child. The names of the donors of such works are for the most part forgotten—they would interest few after their generation had passed away—but the portrait may generally be identified. If among the kneeling or standing figures in a group you remark one who, at some personal inconvenience, looks over his shoulder to face the spectator, it is safe to assume that that is a portrait of the person who commissioned the work. The face, moreover, has an individuality lacking in the rest. Portraits of members of the great Florentine family of the Medici frequently occur in picture and fresco painted by artists of the fifteenth century, and always in a flattering vein. A curious example occurs in Vasari's picture of the two patron saints of that family, SS. Cosmo and Damian; these are likenesses of Cosimo the Elder, and the first Duke of Tuscany, also a Cosimo. In Botticelli's 'Spring,' familiar to everyone through engraving and photography, the youth who stands on the extreme left is almost certainly a representation of Giuliano de' Medici, brother of Lorenzo the Magnificent, who was assassinated by the Pazzi conspirators. There is no room for question concerning the many unavowed likenesses of Cosimo and his famous grandson, Lorenzo—portrait busts of them exist; and if only by reason of the former's bull neck and the latter's misshapen nose, either can be identified at a glance, whether he appear among the Wise Men of the East or in other biblical character. Lorenzo the Magnificent was a liberal patron of the Arts, and painters acknowledged his support in manner calculated to flatter. Even a Medici might be gratified to see himself represented as one of the Magi!

II.

Art cannot be said to have gone far astray in such works, though modern taste might disapprove of the portrayal of a ruler, however excellent, in the character of a saint. Where Art did go astray was when it made the canvas its vehicle for personal vengeance. There are many such pictures, and in some cases a fragment of their history survives. Several famous painters have left works of this description. One of the best known is by Juan Fernandez Navarete, otherwise called El Mudo. This is a 'Martyrdom of St James the Great'; and in it Santoyo, secretary to King Philip II. of Spain, appears as an executioner. It is known that the painter and the secretary were at enmity, but what particular offending procured for Santoyo this left-handed compliment history does not record. Nor does it inform us whether El Mudo suffered for this libel.

A like example of artistic spleen occurs in a picture of the 'Flagellation of Christ' in the

Uffizi Gallery at Florence: among the Roman soldiers wielding the scourge is one who looks round at the spectator with a peculiarly offensive air of defiant satisfaction. It is an unmistakable portrait, meant to display the original in enjoyment of a revolting task; but who is the person thus portrayed we do not know.

The most venomous piece of portraiture I have seen is in a 'Temptation of St Anthony' which hangs in the church of St Agostino at Siena. Jusepe de Ribera, otherwise known as 'Spagnoletto,' is the man who vented his animosity in this work. He left his native Spain in early manhood to study in Italy, and eventually made his home in that country. But to the picture: Saint Anthony, life size, is seated at a *prie-dieu*, his eyes on the book that lies open thereon. Standing at his shoulder, with the air of one who reasons, is one who at first sight appears to be an elderly gentleman. But the question at once presents itself—why is the elderly gentleman nearly nude, wearing little more than those large round horn-rimmed spectacles to use which was a privilege enjoyed only by the Spanish nobility in old days? The thing puzzles, and one looks more closely. It is obviously a portrait, and impresses you as a faithful one. The elderly gentleman's dark hair recedes a little from his temples and is touched with gray, the beard and moustache are carefully trimmed; the face is the face of a well-bred man comfortably nurtured; by no means the sort of person who would wander in desert places with little on but his spectacles. Look yet more closely and you discover the artist's intention, betrayed by the two conventional horns rising through the elderly gentleman's hair, never obtrusive, and now less so than ever, toned down as they are by time. Also you remark that the ears are unnatural, again very judiciously—so slightly pointed as to be scarcely caricatured. Then you realise Spagnoletto's idea. This is a portrait of some Spanish Don who had incurred the wrath of the painter; and thus the Little Spaniard took his revenge. This is perhaps the only picture in existence which represents the devil wearing spectacles.

Naples, in which city Spagnoletto lived for many years and where he did his best work, was in his time under Spanish rule; his nationality commended him to the authorities of Naples, and he was prominent among the artists of his day. But it seems unlikely that he painted this 'Temptation of St Anthony' while within reach of the arm of any Spanish Don; he would have suffered for his temerity. We have to bear in mind the fact that to represent a man as the Evil One, in the earlier half of the seventeenth century, was an affront far more pointed, far more serious, than it would be now. We should dismiss it as a foolish jest in doubtful taste, but it was a very different matter in the eyes of a generation which believed in

the existence of a personal Satan who walked the earth by night; a devil of hideous countenance with horns, hoofs, and tail, such as so many of the old painters, Spanish and Italian, have left us in their pictures of the Inferno.

III.

To modern thought Art went somewhat astray in delineating with minute attention to details the horrors of eternal punishment; but here again we have to remember that its scope was almost confined to the service of religion, and such works commended themselves to the Church as terrible warnings. And warnings they doubtless were to the unregenerate who accepted as literal those visions of the nether regions in the semblance of foundry or volcano, lurid with flames, peopled with fiends who clubbed, flogged, and pitchforked erring humanity into fiery torment. The artist only obeyed the creed in which he had been reared when he produced such works; merely accepted and set forth the teachings of his Church. We may look upon them as the fruit of a diseased imagination; our progenitors of the Middle Ages saw in them dreadful presentations of reality. The Church encouraged; but it could also threaten, and it approved such aid from Art.

Returning for a moment to that 'Temptation of St Anthony.' Spagnoletto would scarcely have ventured to pillory offending Dons thus in his own country; for in Spain the arts were under strict surveillance—not with an eye to prevention of such pictorial libel, but to guard against the exhibition of works that might offend the grave Spanish temperament. Nothing that could shock propriety or religious feeling might be hung in church or public building or exposed for sale; and from the records it would seem that the Spanish sense of propriety was easily shocked. The person guilty of painting or exposing such pictures was liable to excommunication, imprisonment, exile, or fine at the hands of the Holy Office, which appointed inspectors in the various towns and districts to enforce the law. And these Familiars did their duty with zest and rigour. Nude figures seem to have been the special quarry in this purity campaign; but the inspectors took a wide view of the improper, and did not confine themselves to condemnation of the nude. In the sixteenth century a painter of Cordoba was brought to trial and imprisoned by the Holy Inquisition; his offence, the painting of a Crucifixion, in which the Madonna was portrayed in embroidered petticoat and farthingale, and St John in trunk hose.

It is very unlikely that that painter of Cordoba was guilty of intentional profanity. Such anachronisms in dress were very usual in works of his period and later, artists giving the characters in biblical scenes the attire of their own time. Pictures of the early saints

and martyrs in which the characters are represented in brightly-hued doublet and trunk hose are very common in Italy. I recall a fresco in a ruined village chapel, a Flagellation, in which those who wielded the scourges were all thus arrayed. One of the greatest pictures in the world—Titian's 'Presentation of the Virgin,' in the Academy at Venice—is thus treated. The principal figure, the Madonna, is portrayed as a country girl in a simple blue gown such as the *contadina* of the sixteenth century habitually wore; the ancillary characters, richly dressed with many jewels, serve to set off the beautiful simplicity of the Virgin's attire.

It was no doubt at the instance of the Spanish Holy Office—the influence of Spain being then strong in Italy—that a purity campaign was undertaken against the artistic productions of the latter country. Italy, however, adopted methods less drastic—for which we may be grateful. She did not ordain destruction of such works as were thought to offend; an example of her more lenient system of correction is furnished by Michael Angelo's great fresco, 'The Last Judgment,' in the Sistine Chapel, which included nude figures. Pope Paul IV. commissioned Daniele of Volterra to paint clothing on such as appeared to require it; which task earned for Daniele the nickname of Ill Bragghetone—'the breeches-maker.'

But this is propriety going astray; not art. It was a curious misuse of his talent which led Andrea del Castagno, a fifteenth-century painter, to introduce into one of his sacred pictures a portrait of himself as Judas Iscariot. For long the thing was explained by a story that Castagno had assassinated a fellow artist, Domenico Veneziano, of whom he was jealous, and, subsequently falling a prey to remorse, made atonement by depicting himself in the vilest of characters. Modern research, however, has spoiled the story, bringing to light the fact that Veneziano was never murdered at all; and, further, survived Castagno by some four years, which puts him out of court. There remains, of course, the possibility that Castagno murdered somebody else, and thus did artistic penance. We may leave it at that.

IV.

There was a period when painters were stricken with a craze for realism—rather dangerous when sacred subjects practically monopolised their easels. Realism may be legitimate in allegorical scenes, as when Giotto adorned the Bardi Chapel with, among others, 'Poverty defending herself with a stick from a Dog.' Poverty had not before, and has probably not since, been presented in this posture. And when shown as at a house door begging, to the suspicion of the watch-dog, it ceases to wear the allegorical complexion, trespassing as it does upon the realm of fact.

Realism in sacred subjects rarely produces happy results. It was quite usual to introduce into scenes of 'The Last Supper' a dog crouching under the table, or wandering about in expectation of scraps; and the presence of the dog does not offend. But in two such works a cat is introduced, and the result is curiously different. Pocetti's 'Last Supper' in the Siena Gallery is one, and the novelty at once impresses as a breach of artistic tact; the cat under the table, hunched up at the feet of one of the disciples, imports a note of homeliness discordant with the spirit that should inform the subject. The other work is a fresco by Pietro Lorenzetti on the ceiling of the church of St Francis at Assisi: in this is shown through a doorway a cook cleaning dishes, and near him a cat stealing morsels of meat. Again an artistic offending in the domesticity and irrelevancy of the incident. Another unusual detail of this fresco is the attitude of the servant, who points his thumb in contempt at the guests—manifestly expressing surprised distaste for the presence of Judas.

There is at Perugia a Madonna and Child which must be unique. This is the work of Giovanni Bottati, painted in 1447. The Child sits upright on His Mother's knee, responding to the advances of a small white dog whose forepaws are on the Madonna's lap. It startles but does not repel; there is about the picture a tenderness and simplicity which redeem Raphael's famous 'Madonna of The Goldfinch' in the Uffizi recurs to mind in this connection.

The same homely but rather pleasing note appears in Giotto's picture of the 'Virgin in Adoration' in the chapel of San Silvestro at Florence: in the background is a group of shepherds, one of whom restrains a barking dog from attacking the Mother and Child.

The most unfortunate results of the striving after realism appear in various pictures of saints in the act of restoring the dead to life. Seeking to enforce actuality, the artists represent bystanders handkerchief to nose; sometimes with head averted in disgust; with the inevitable result that attention is drawn to the disagreeable aspect of the Raising. If memory does not play me false, it is in Ridolfo Ghirlandajo's 'St Zenobia' that this feature is given peculiarly repugnant prominence. Conspicuous among those about the open grave is a dwarf in motley, with an immense sugar-loaf hat, who, handkerchief on the way to his nose, turns a grotesquely wry face to the spectator.

This sort of thing may have made the works more convincing to the generation for which they were painted; but restraint in art, as in literature, is a quality we can appreciate.

V.

One of the large frescoes in the Spanish Chapel at Florence is noteworthy for an odd

conceit. The principal groups are a pope with cardinals, bishops, and other high ecclesiastics; and a monarch surrounded by great officers of state. In the foreground is a pack of black and white hounds, with a few somewhat conventional wolves, which appear oddly out of place in such grave and exalted company. Church dignitaries, we know, were addicted to the chase in an elder day, but we do not expect to find them portrayed with their hounds in a church. The explanation is that the fresco is allegorical. This is a Dominican chapel, and the habit of the Dominican order is black and white. The hounds are the hounds of the Lord (*Domini canes*), and the wolves represent the heretics it is their pious duty to hunt and destroy.

One of the earliest Italian painters, Buffalmaco by name, seems to have made a point of importing into his pictures any angry feeling that possessed him at the time. He was also a humorist. He was once commissioned by the Perugian local authorities to paint a picture of Ercolano, the patron saint of the town. He undertook the work, but lingered over it till the city fathers became impatient. They worried him to make haste and complete his picture; and worrying is what no artist will tolerate. Buffalmaco got to work and executed the commission, but he revenged himself by giving St Ercolano a diadem of fishes instead of the orthodox halo. A jest obscure to us and requiring elucidation. In early Christian art the fish symbolised water, therefore baptism, therefore Christianity. Now Ercolano was a militant saint. He was Bishop of Perugia when the city was besieged, took a prominent part in the defence, and lost his life at the hands of the enemy. Buffalmaco, therefore, gave the saint of his picture the symbol of Christianity in an ironical spirit, as Ercolano owed his martyrdom to his prowess as a fighting man.

A story is told of this painter, who lived in the fourteenth century, which suggests that he was reckless of his reputation. He was asked to adorn the wall of a small chapel with a fresco of St Christopher, who, according to tradition, was twelve braccia (or cubits) in height. The wall to be decorated was only nine braccia high, and the patron who wished to commission the work, an unlettered man and stupid, could not be made to see that a figure twelve braccia high cannot be painted on a wall of only nine. He insisted that the St Christopher must be of the altitude stated in sacred tradition, and Buffalmaco was unable to convince him to the contrary. 'Very well,' he may have said; 'have it your own way. I'll do what you want, and I *hope* you'll like it.' He painted the twelve-braccia-high saint sitting on the floor, whereon his legs protruded as far as the chapel door.

If this be a representative example of Buffalmaco's method of satisfying patrons we need feel no surprise that few of his works survive.

JOHN MACNAB: A COMEDY FOR POACHERS.

By JOHN BUCHAN, Author of *John Burnet of Barns, Greenmantle, &c.*

CHAPTER XI.—HARIPOL; THE MAIN ATTACK.

SOME men begin the day with loose sinews and a sluggish mind, and only acquire impetus as the hours proceed; others show a declining scale from the vigour of the dawn to the laxity of evening. It was fortunate for Lamancha that he belonged to the latter school. At day-break he was obstinate, energetic, and frequently ill-tempered, as sundry colleagues in France and Palestine had learned to their cost; and it needed an obstinate man to leave Crask between the hours of five and six in the morning on an enterprise so wild and in weather so lamentable. For the rain came down in sheets, and a wind from the north-east put ice into them. He stopped for a moment on the summit of the Crask ridge, to contemplate a wall of driving mist where should have been a vista of the Haripol peaks.

'This wund will draw beasts intil the Sanctuary without any help from Macnicol,' said Wattie morosely. 'It's ower fierce to last. I wager it will clear long afore night.'

'It's the weather we want,' said Lamancha, covering from the violence of the blast.

'For the Sanctuary—maybe. Up till then I'm no' sae sure. It's that thick we might maybe walk intil a navvy's airms.'

The gods of the sky were in a capricious mood. All down the Crask hillside to the edge of the Doran the wet tablecloth of the fog clung to every ridge and hollow. The stream was in roaring spate, and Lamancha and Wattie, already soaked to the skin, forded it knee-high. They had by this time crossed the moor-road from Crask to Haripol, and marked the nook where in the lee of rocks and birches Archie was to be waiting with the Ford car. Beyond lay the long lift of land to the Haripol peaks. It was rough with boulders and heather, and broken with small gullies, and on its tangled face a man might readily lose himself. Wattie disliked the mist solely because it prevented him from locating the watchers, since his experience of life made him disinclined to leave anything to chance; but he had no trouble in finding his way in it. The consequence was that he took Lamancha over the glacis at the pace of a Gurkha, and in half-an-hour from the Doran's edge had him panting among the screes just under the Beallach which led to the Sanctuary. Somewhere behind them were the vain navvy pickets, happily evaded in the fog.

Then suddenly the weather changed. The wind shifted a point to the east, the mist furled up, the rain ceased, and a world was revealed from which all colour had been washed, a world as bleak and raw as at its first creation. The gray

screes sweated gray water, the sodden herbage was bleached like winter, the crags towering above them might have been of coal. A small fine rain still fell, but the visibility was now good enough to show them the ground behind them in the style of a muddy etching.

The consequence of this revelation was that Wattie shuffled into cover. He studied the hillside long and patiently with his glass; then he grunted, 'There's four navvies, as I mak out, but no' verra well posted. We cam gei near ane o' them on the road up. Na, they canna see us here, and besides they're no lookin' this airt.' Lamancha tried to find them with his telescope, but could see nothing human in the wide sopping wilderness.

Wattie grumbled as he led the way up a kind of *nullah*, usually as dry as Arabia, but now spouting a thousand rivulets, right into the throat of the Beallach. 'It's clearin' just when we wanted it thick. The ways o' Providence is mysteerious. . . . Na, na, there's nae road there; that's a fox's track, and it's the deer's road we maun gang. Stags will no' climb rocks, sensible beasts. . . . The wind's gone, but I wish the mist wud come doun again.'

At the top of the pass was a pad of flat ground covered thick with the leaves of cloud-berries. On the right rose the Pinnacle-Ridge of Sgurr Dearg, in its beginning an easy scramble which gave no hint of the awesome towers which later awaited the traveller; on the left Sgurr Mór ran up in a steep face of screes. 'Keep doun,' Wattie enjoined, and crawled forward to where two boulders made a kind of window for a view to the north.

The two looked down into three little corries which, like the fingers of a hand, united in the palm of a larger corrie, which was the upper glen of the Reascuill. It was a sanctuary perfectly fashioned by Nature, for the big corrie was cut off from the lower glen by a line of boiler-plates like the wall of a great dam, down which the stream plunged in cascades. The whole place was loud with water—the distant roar of the main river, the ceaseless dripping of the cliffs, the chatter and babble of a myriad hidden rivulets. But the noise seemed only to deepen the secrecy. It was a world in monochrome, every detail clear as a wet pebble, but nowhere brightness or colour. Even the coats of the deer had taken on the dead gray of the slaty crags.

Never in his life had Lamancha seen so many beasts together. Each corrie was full of them, feeding on the rough pastures or among the boulders, drifting aimlessly athwart the spouts of scree below the high cliffs, sheltering in the

rushy gullies. There were groups of hinds and calves, and knots of stags, and lone beasts on knolls or in mud-baths, and, since all were restless, the numbers in each corrie were constantly changing.

'Ye Gods, what a sight!' Lamancha murmured, his head at Wattie's elbow. 'We won't fail for lack of beasts.'

'The trouble is,' said Wattie, 'that there's ower mony.' Then he added obscurely that 'it might be the day o' Pentecost.'

Lamancha was busy with his glass. Just below him, not three hundred yards off, where the ravine which ran from the Beallach opened out into the nearest corrie, there was a group of deer—three hinds, a little stag, and farther on a second stag of which only the head could be seen. 'Wattie,' he whispered excitedly, 'there's a beast down there—a shootable beast. It's just what we're looking for . . . close to the Beallach—'

'Ay, I see it,' was the answer. 'And I see something mair. There's a man ayont the big corrie. D'ye see yon rock shapit like a puddock-stool. . . . No, the south side o' the waterfa'. . . Well, follow on frae there towards Bheinn Fhada. Have you got him?'

'Is that a man?' asked the surprised Lamancha.

'Where's your een, my lord? It's a man wi' gray breeks and a brown jacket; an' he's smokin' a pipe. Ay, it's Macqueen. I ken by the lang legs o' him.'

'Is he a Haripol gillie?'

'He's the second stalker. He's under notice, for him and young Mr Claybody doesna 'gree. Macqueen comes frae the Lawlands, and has a verra shairp tongue. They was oot on the hill last week, and Mr Johnson was pechin' sair gaun up the braes, an' no wonder, puir man. He cries on Macqueen to gang slow, and says, apologetic-like, "Ye see, Macqueen, I've been workin' terrible hard the past year, and it's damaged my wund." Macqueen, who canna bide the sight of him, says, "I'm glad to hear it, sir. I was feared it was maybe the drink." Gey impident?'

'Shocking.'

'Weel, he's workin' off his notice. . . . I'm pleased to see him yonder, for it means that Macnicol will not be there. Macnicol—' Wattie chuckled like a dropsical corn-crake—'is maist likely beatin' the roddydendrum for the wee dog. Macqueen is set there so as he can watch this Beallach, and likewise the beallach of the Red Burn on the Machray side, which I was tellin' ye was the easiest road. If ye were to kill that stag down below he could baith see you and hear you, and ye'd never be allowed to shift it a yaird. . . . Na, na. Seein' Macqueen's where he is, we maun try the wee corrie right under Sgurr Dearg. He canna see into that.'

'But we'll never get there through all those deer.'

'It will not be easy.'

'And if we get a stag we'll never be able to get it over this Beallach.'

'Indeed it will take a great deal of time. Maybe a' night. But I'll no' say it's not possible. . . . Onyway, it is the best plan. We will have to tak a lang cast round, and we maunna forget Macqueen. I'd give a five-pun-note for anither blatter o' rain.'

The next hour was one of the severest bodily trials which Lamancha had ever known. Wattie led him up a chimney of Sgurr Mór, the depth of which made it safe from observation, and down another on the north face, also deep, and horribly loose and wet. This brought them to the floor of the first corrie at a point below where the deer had been observed. The next step was to cross that corrie eastward towards Sgurr Dearg. This was a matter of high delicacy—first because of the number of deer, second because it was all within view of Macqueen's watchtower.

Lamancha had followed in his time many stalkers, but he had never seen an artist who approached Wattie in skill. The place was littered with hinds and calves and stags, the cover was patchy at the best, and likewise the beasts were restless. Wherever a route seemed plain the large ears and spindle-shanks of a hind appeared to block it. Had he been alone Lamancha would either have sent every beast streaming before him in full sight of Macqueen, or he would have advanced at the rate of one yard an hour. But Wattie managed to move both circumspectly and swiftly. He seemed to know by instinct when a hind could be bluffed, and when her suspicions must be laboriously quieted. The two went for the most part on their bellies, like serpents, but their lowliness of movement would have been of no avail had not Wattie, by his sense of the subtle eddies of air, been able to shape a course which prevented their wind from shifting deer behind them. He well knew that any movement of beasts in any quarter would bring Macqueen's vigilant glasses into use.

Their task was not so hard as long as they were in hollows on the corrie floor. The danger came in crossing the low ridge to that farther corrie which was beyond Macqueen's ken, for as they ascended the wind was almost bound to carry their scent to the deer through which they had passed. Wattie lay long with his chin in the mire, and his eyes scanning the ridge, till he made up his mind on his route. Obviously it was the choice of the least among several evils, for he shook his head and frowned.

The ascent of the ridge was a slow business, and a toilful. Wattie was clearly following an elaborate plan, for he zigzagged preposterously, and would wait long, for no apparent reason, in places where Lamancha was held precariously by half a foothold and the pressure of his nails.

Anxious glances were cast over his shoulder at the post where Macqueen was presumably on duty. The stalker's ears seemed of an uncanny keenness, for he would listen hard, hear something, and then utterly change his course. To Lamancha it was all inexplicable, for there appeared to be no deer on the ridge, and the place was so much in the lee that not a breath of wind seemed to be abroad to carry their scent. Hard as his condition was, he grew furiously warm and thirsty, and perhaps a little careless, for once or twice he let earth and stones slip under his feet.

Wattie turned on him fiercely. 'Gang as if ye was growin',' he whispered. 'There's beasts on a' sides.'

Sobered thereby, Lamancha mended his ways, and kept his thoughts rigidly on the job before him. He crept docilely in Wattie's prints, wondering why on a little ridge they should go through exertions that must be equivalent to the ascent of the Matterhorn. At last his guide stopped. 'Put your head between these busses,' he enjoined. 'Ye'll see her.'

'See what?' Lamancha gasped.

'That dour deevil o' a hind.'

There she was, a gray elderly beldame, with her wicked pucklike ears, aware and suspicious, not five yards off.

'We canna wait,' Wattie hissed. 'It's ower dangerous. Bide you here like a stone.'

He wriggled away to his right, while Lamancha, hanging on a heather-root, watched the twitching ears and wrinkled nozzle. . . . Presently from farther up the hill came a sharp bark, which was almost a bleat. The hind flung up her head, and gazed intently. . . . Five minutes later the sound was repeated, this time from a lower altitude. The beast sniffed, shook herself, and stamped with her foot; then she laid back her ears, and trotted quietly over the crest.

Wattie was back again by Lamancha's side. 'That puzzled the auld bitch,' was his only comment. 'We can gang faster now, and God kens we've nae time to loss.'

As Lamancha lay panting at last on the top of the ridge he looked down into the highest of the lesser corries, tucked right under the black cliffs of Sgurr Dearg. It was a little corrie, very steep, and threaded by a burn which, after the rain, was white as a snowdrift. Vast tumbled masses of stone, ancient rockfalls from the mountain, lay thick like the cottages in a hamlet. At first sight the place seemed to be without deer. Lamancha, scanning it with his glass, could detect no living thing among the debris.

Wattie was calling fiercely on his Maker. 'God, it's the auld hero,' he muttered, his eyes glued to his telescope.

At last Lamancha got his glass adjusted, and saw what his companion saw. Far up the corrie on a patch of herbage—the last before

the desert of the rocks began—stood three stags. Two were ordinary beasts, shootable, for they must have weighed sixteen or seventeen stone, but with inconsiderable heads. The third was no heavier, but he had a head like a blasted pine—going back fast, for he was old, but still with thirteen clearly-marked points, and a most noble spread of horn.

'It's him,' Wattie crooned. 'It's the auld hero. Fine I ken him, for I seen him on Crask last back-end rivin' at the stacks. There's no' a forest hereaways but they've had a try for him; but the Deil's in him, for the grandest shots aye miss. What's your will, my lord? Dod, if John Macnab gets yon lad, he can cock his bonnet.'

Lamancha felt his heart beat faster. 'I don't know, Wattie. Is it fair to kill the best beast in the forest?'

'Keep your mind easy about that. Yon's no a Haripol beast. He's oftener on Crask than on Haripol. He's a traveller, and in one season will cover the feck o' the Hielands. I've heard that, oreeginally, he cam oot of Kintail. He's terrible auld—some says a hundred year; and if you dinna kill him, he'll perish next winter, belike, in a snaw-wreath, and that's a puir death to die.'

'It's a terrible pull to the Beallach.'

'It will be that, but there's the night afore us. If we don't tak that beast—or one o' the three—I doubt we'll no get anither chance.'

'Push on, then, Wattie. It looks like a clear coast.'

'I'm no' so sure. There's that hind somewhere afore us.'

Down through the gaps of the Pinnacle Ridge blew fine streamers of mist. They were the precursors of a new storm, for long before the two men had wormed their way into the corrie the mountain before them was blotted out with a curtain of rain, and the wind, which seemed for a time to have died away, was sounding a thousand notes in the Pan's pipes of the crags.

'Good,' said Lamancha. 'This will blanket the shot.'

'Ba-ad too,' growled Wattie, 'for we'll be duntin' against the auld bitch.'

Lamancha believed he had located the stags well enough to go to them in black darkness. You had only to follow the stream to its head, and they were on the left bank a hundred yards or so from the rocks. But when he reached the burn he found that his memory was useless. There was not one stream but dozens, and it was hard to say which was the main channel. It was a loud world again, very different from the first corrie, but when he would have hastened, Wattie insisted on circumspection. 'There's the hind,' he said, 'and maybe some sma' stags. It's early in the day, man; and since we're out o' Macqueen's sight, there's nae need to hurry.'

His caution was justified. As they drew

themselves up the side of a small cascade the tops of a pair of antlers were seen over the next rise. Lamancha thought they were those of one of the three stags, but Wattie disillusioned him. 'We're no' within six hundred yards o' yon beasts,' he said.

A long circuit was necessary, happily in good cover, and the stream was not rejoined till at a point where its channel bore to the south, so that their wind would not be carried to the beasts below the knoll. After that it seemed advisable to Wattie to keep to the water, which was flowing in a deep-cut bed. It was a job for a merman rather than for breeched human beings, for Wattie would permit of no rising to a vertical or even to a kneeling position. The burn entered at their collars, and flowed steadily through their shirts to an exit at their knees. Never had men been so comprehensively and continuously wet. Lamancha's right arm ached with pulling the rifle along the bank—he always insisted on carrying his weapon himself—while his body was submerged in the icy outflow of Sgurr Dearg's springs.

The pressure of Wattie's foot in his face halted him. Blinking through the spray, he saw his leader's head raised stiffly to the alert in the direction of a little knoll. Even in the

thick weather he could detect a pair of bat-like ears, and he realised that these ears were twitching. It did not need Wattie's whisper of 'the auld bitch' to reveal the enemy.

The two lay in the current for what seemed to Lamancha at least half-an-hour. He had enough hill-craft to recognise that their one hope was to stick to the channel, for only thus was there a chance of their presence being unrevealed by the wind. But the channel led them very close to the hind. If the brute chose to turn her foolish head they would be within view.

With desperate slowness, an inch at a time, Wattie moved upwards. He signed to Lamancha to wait while he traversed a pool where only his cap and nose showed above the water. Then came a peat wallow, when his face seemed to be ground into the moss, and his limbs to be splayed like a frog's and to move with frog-like jerks. After that there was a little cascade, and beyond, the shelter of a big boulder which would get him out of the hind's orbit. Lamancha watched this strange progress with one eye; the other was on the twitching ears. Mercifully all went well, and Wattie's stern disappeared round the corner of rock.

(Continued on page 355.)

U M S I N D U S I.

By JAY BROWNE.

I.

LONDON on the Thames, Paris on the Seine, Rome on the Tiber—cities and rivers alike are within the ken of every schoolboy; but it is open to question how many of the youths of South Africa could name the river on which has been raised the capital of Natal, the Garden Colony, one of the provinces of the Union.

Pietermaritzburg, on the Umsindusi, is named after Piet Retief and Gerrit Maritz, *voortrekkers* or pioneers of the Dutch who had worked their way up from the Cape when the restraint of British rule had become irksome, found their way over the Drakensberg Mountains into Natal, laagered and settled down in the place which perpetuates the memory of their leaders, eventually to acquiesce in the sovereignty from which they had endeavoured to escape.

This was over eighty years ago, when the rich grasses of the high veld, the sheltered kloofs and undulations of the midlands, and the bush and pastures of the coast lands provided food and cover for herds of game, big and small, which roamed the country end to end, but have long since disappeared before advancing civilisation with its uncontrolled slaughter of Nature's noblest animal creations.

No longer does the elephant trumpet in the

bush, the hippopotamus wallow in the rivers and lagoons, the rhinoceros and the zebra feed on the plains; or the gnu, the koodoo, the eland, and the buffalo attract the sportsman or the hunter.

In these later days, and almost too late even for them, the smaller surviving antelopes and their kin are perfunctorily preserved from extermination, whilst the establishment of a National Park, near those passes through the Drakensberg which admitted the *voortrekkers* of old, serves as a sanctuary for such animals as have been and are being gradually re-established within its area.

The seal of the city and borough of Pietermaritzburg, under the five stars of the Southern Cross, bears the representation of an elephant with the native name 'Umgungunhlovu,' possibly derived from the Zulu words 'Isikungu Sendllovu,' meaning the 'Elephants' Retreat.'

The association of the animal with the city is purely symbolic, and indicative of the importance of the latter as the seat of administration by the representative of the Great White Queen.

But it is not with the attractions and amenities of this colonial town of rapid growth, with the advantages and conveniences derived from modern science and experience, that we would

dally, unless to say that, with a delightful climate, botanical gardens, parks, and recreation grounds, a university college, fine public and private schools, and a situation of great beauty, it has few rivals, if any, as a place of residence in the sub-continent. It is to the river the Umsindusi, rising in the distant hills, that we would render our tribute of gratitude for happy hours away from the stuffy courts of justice, the office, or the store; and so, taking our fishing-rod and tackle, our kodak, and our field-glass, we make for the boathouse.

II.

Roberts, the Mauritian boatman, is worthy of the confidence of the club. Every boat of the fleet is his especial child; from keel to rowlock there is no flaw, no perfection of which he is unaware. The river is his father and his mother; the club-house, its garden, with glorious roses and hydrangeas, its banks of mesembryanthemums and neat hedges of *Abelia rupestris*, are his wife and brothers.

His, too, is the care of three miles of the river, the planting and maintenance of weeping-willows, casuarinas, pepper-trees, and what-not that beautify its banks. But it is not always blooming; the paint and varnish do not always shine. How, were it otherwise, could Umsindusi sustain its designation? Not without reason has the word *msundeze*, to 'push or carry away,' given the river its present name.

More than once disaster has fallen, when heavy thunderstorms 'up-country' have brought down the torrent so swiftly that Roberts and his native 'boys' have been unable to rescue all the boats from the twenty feet or more of flood that has suddenly overwhelmed them, and the labour of restoration has been arduous and prolonged. But now the telephone at the storage station sends down its warning of impending storm, and all is 'made fast' in anticipation.

To-day is glorious. It is the middle of March, and the last struggles of the summer sun in a cloudless sky are not too violent for comfort as I take up my sculls, and quietly, half drifting with the gentle current, pull down the stream.

The high banks, with their growth of trees and thicket, exclude all view except the distant hills, some covered with virgin bush, others with plantations of various eucalypti and of *Acacia mollissima*, the production of bark of the latter, for tanning purposes, being a substantial local industry. A hundred yards, and I am alone with the river and its secrets.

III.

Here and there a splash and a ripple tell of the rise, to some attractive grasshopper or other insect, of a scale fish (*Barbus Bowkeri*), attractive and carp-like. Yonder, from a ledge

of shale, a couple of water-tortoises waddle out of sight into the concealing element. The soothing cooing of doves mingles with the twittering of weaver birds hovering round their pendant and now deserted nests, and the persisting and distracting call of guinea-fowl in the long seeding grass is challenged by the crowing of a domestic fowl at a nearby homestead. On my right is a dense thicket from which proceeds the quick and prolonged kuk-kuk-kuk of the rain bird, the lark-heeled cuckoo, *Centropus Burchelli* of the ornithologist. Sinuously and noiselessly it emerges, and so well does its reddish-brown plumage blend with the tints of the foliage of the scrub that its movement alone reveals its presence.

I pass under the overhanging branches of a large willow, in a fork of the branches of which, high up and well over the river, is the abandoned nest of the hammerhead (*Scopus umbretta*), so named on account of the form of head and crest. This quaint and sepia-coated eater of frogs and other aquatic denizens favours the proximity of marshes and river banks, and its dancing displays, when two or three of them are gathered together, afford no little amusement to the fortunate spectator. Its huge domed nest of sedge and mud, sometimes three feet in diameter, is accessible only by a small hole in the side most distant from the points of attachment to the tree, and is practically unassailable to the predaceous assaults of enemies.

The nest above, though deserted by its architects, is not untenanted. A slight movement in the dimness of its interior reveals the blinking eyes of a barn owl (*Strix flammea*) peering through the sunlight at the intruder on its solitude.

A tree stump projecting from the river-bank appears to be the objective of a shag (*Phalacrocorax Afr.*) seeking a favourable perch for operations, but a sheering in its flight—as though changed intention had decided its noiseless dive into the stream—results in the discovery, through the glasses, of an iguana basking on the point of vantage rejected by the water-bird, which emerges some yards beyond, with its long snake-like neck above the surface. A bend in the river provides a shoaling stretch of bank covered with six-foot reed and bulrush, over which hover dragonflies and other winged insects, butterflies of brilliant colour, black-winged mosquitoes and midges, which harass the fisherman as he seeks a likely place to cast his line. That sparkling gem of iridescence, the malachite kingfisher (*Corythornis cyanostigma*), flits by, and, unafraid, allows us to admire its resplendent sheen before darting away to a more promising hunting-ground.

Here and there are clumps of arums, whose last ivory-white blooms of the season, set well above the vivid green of their foliage, contrast with those of ageratum, the attractive delicate

powder-blue flowers of which are said to bring ill-luck if used for decorative purposes; and wild geraniums and convolvuli, white, pink-streaked, and delicate blue, intertwine with the graceful feathery fronds of wild asparagus.

IV.

We are now at the weir, where the stretch of water suitable for boating terminates; so, mooring my small craft, I follow the stream down its right bank, making my way through primitive gardens, where a small community of free Indians endeavour to supplement their incomes and their food-supply by the cultivation, in patches, of maize (locally known as 'mealies'), dholl, sweet potatoes, chillies, and other vegetables dear to the heart of the Oriental.

These Indians, or coolies, as they are more generally called, are, for the most part, sometime indentured men and women, natives of India who, having completed their term of employment under agreement, have settled in this country of congenial climate and of employment unrestricted by caste. The supply of vegetables to Europeans is almost entirely in their hands; and various occupations, which would be considered *infra dig.* by the superior white man or the native, are followed, to his own advantage and profit, by the somewhat despised but indispensable Indian.

Leaving the gardens behind, a short tramp through swampy ground finds me in a derelict orchard, where oblivion and consequent decay have covered the growth of apricots, lemon, peach, and orange with habiliment of lichen, creepers, and degenerate grape vines. There is an indescribable charm about this deserted witness of former occupancy, the almost tangible silence broken only by the babbling of the river and the notes of the birds which flit from tree to tree and curiously eye the intruder on their solitudes.

Here and there one gets a glimpse of the glorious paradise flycatcher (*Terpsiphone cristata*), whose dainty nest is concealed from the unaccustomed eye by the coating of lichen which also covers the branch to which it is attached. Flights of colys (*Colius striatus*) in mouse-coloured plumage, with long tails and heads crested and beaked like parrakeets, reluctantly and protestingly leave the fruits on which they are feeding, and a fiscal shrike (*Fiscus collaris*) betrays his larder as he spikes a fat grasshopper on the thorn of a lemon-tree.

V.

But these enchantments are only a few of those the revelation of which delights the nature lover, and we again betake ourselves to the river-bank and fix up our rod and line, meantime considering the *modus operandi* likely to produce successful results.

Shall it be 'scale-fish' with grasshopper or artificial fly in the rapids, and where they broaden

out into the likely pool below, or bottom fishing for either scale or barbel in the greater depths with worm or mealy dough, soft crab, or the deadly larva of the hornet, robbed from the little clay nest under the framework of the veranda? We decide on the dough, the mealie meal which, with an admixture of wheaten flour to render it more adhesive to the hook, my native cook has carefully prepared by boiling, like a pudding in a cloth, to the correct consistency.

The current not being strong, a half-dozen buck-shot suffice to sink my bait, and, casting well out into deep water, I wait for the scarcely perceptible straightening of the line which indicates an inspection of the product of the kitchen. The line slackens. Has the bait been rejected as insufficiently attractive, or has it been raised preparatory to being taken? This is the moment when a sudden strike means loss of bait, or fish, or both. Carefully you raise the point of your rod, and again the line tautens, and training and instinct tell that it is the time to strike, not strongly and suddenly, but with conviction to your victim that the titbit will be lost to him unless he holds it.

In the toothless, muscular mouth the sharp hook finds a good hold, and, at the moment of penetration, a sudden rush confirms the capture. A little care, a little patience, a good deal of excitement, and some skill in manœuvring with the net, and a three-pounder lies in your creel. Perhaps your pleasure, as you admire the golden tints of your catch glinting in the sunlight, is modified by the knowledge that the sweetness of its flesh is somewhat spoiled by the rather numerous bones on which the frame is built; but appetite is a good sauce, and enjoyment is not marred when reminiscence blinds discomfort. The pickle jar of vinegar with curry powder, pepper-corns, and cloves renders the bones innocuous, and provides a breakfast dish of relish when the heat of summer dulls the palate and craves for stimulation.

VI.

The slightly heavier cast for bottom fishing is now discarded for one for fly, and after much energetic chasing with a small branch of wattle well covered with leaf, I capture a grasshopper, the underwings of a bright and attractive red colour. Carefully fixed on the hook, it floats on the rippling surface of the little rapid into the pool beyond. There is a swirl and a splash, but I strike too soon. Again the operation is performed and with the same result except that my grasshopper, bedraggled and insecure on the hook, must be removed.

It is now too hot, with the sun directly overhead and consequent increasing activity of the grasshoppers, to indulge in a further exhibition of skill in their capture, so tactics are varied by the substitution of artificial flies—a March Brown and a Coch-y-bonddu. The

selection of the latter is determined by the similarity of colouring to the attractive grasshopper, a choice which soon justifies the experiment.

Adopting the previous procedure, but with the greater confidence inspired by the more secure nature of the lure, I watch the flies bobbing on the water, and a small fish rises to, but does not take, the March Brown. There is no further movement as the cast travels over the pool almost to its farthest margin, where the reeds raise their heads amongst the clumps of elephant's ear (*Colocasia esculenta*). Shall I re-cast, or let out my line a few feet more? I decide on the latter, and hardly is the decision made than that delightful sensation of simultaneous rise and strike is communicated by the vibrating line.

An attempted break into the protective area of the reeds is quickly checked, and downstream with a rush goes the captured one, slackens, returns, and doubles again. To each movement the line responds, and after a plucky struggle, number two lies in the basket. Just under two pounds, less brilliant than his companion; but so it is, the smaller fish are of a duller, more leaden colour, though all fight as gamely and perhaps more strongly ounce for ounce than do the trout of the higher streams, which, maybe, have not improved in tone by their translation to the sub-tropics.

There is much bottom feeding in these rivers, and the larger fish rise less readily to the fly. Mudfish (*Clarius gariepinus*), which abound and grow to large size, are more easily taken with

worm or raw meat, but are unworthy of the time of the fisherman. Ugly in form, muddy of flavour, prone when hooked to dive and sulk for long in the depths of the pools, they are unfavoured and unsought, but in bottom fishing are—as well as eels and crabs—a source of annoyance to the Waltons of the river, who cannot discriminate between their unseen victims.

VII.

The sky, which has been unbroken, now shows sign of change. Heavy white clouds are rising rapidly from the horizon, swifts and swallows are flying lower; so, discreetly valorous, we take down our rod and wend our way back to our landing-place, which is reached as the first big drops of rain send up their splashes from the river. A rumble of distant thunder increases the strength and pace of our stroke, but the shower, though heavy, is of short duration, and has but served to brighten up the foliage, cool the atmosphere, and enliven the thicket and the undergrowth.

The bushes of cassia, of which this morning the yellow blooms were haunted by innumerable bees, busy with the collection of their generous supply of pollen, are now deserted. A solitary spotted eagle owl (*Bubo maculosus*), going out for the night, glides silently by, as though to conceal the early hour of assignation; and as I reach the boathouse the air is thick with flying ants, whilst the splashing of jumping fish proclaims their toll and revelry in glorious repast.

THE TENDERFOOT.

By H. K. DERRY.

AT the moment when Frankie settled himself into his camp-chair in the African log-hut, with a leopard-infested forest a few feet in front of him, a hundred black savages several yards to his right, and no other white man within five miles, Mr and Mrs Jinks were sitting down snugly to their high-tea in the dining-room at Hampstead, and talking lovingly of their only son.

Photographs of Frankie adorned the walls, mantel-piece, and bureau; Frankie as a suety-faced baby; a skinny little boy paddling at Ramsgate; a lanky creature in a Grammar School cap; a still lankier one in flannels at the suburban tennis-court; a rather pathetic figure in ill-fitting evening-dress trying to look manly; and lastly, a delicate-looking youth in a big pith helmet and white suit, scowling at the tropical sun.

Mr Jinks belonged to a Leek Club and played bowls; his wife read the *Picturegoers Weekly* and played 'patience' in the intervals of knitting

woolly undergarments for her offspring. They were neither of them the stuff adventurers are made of, and Frankie's spirit fled, yearningly, back to their safe and comfortable presence, when first the unearthly yells and shrieks of the work boys had fallen on his frightened ears.

'Wongai, what on earth is it? What's the row?'

Wongai stuck his woolly head out of the gap on the log-wall—it was called the 'window.'

'The Kisii, Bwana! They are all coming out of their huts. They have painted their faces.'

Frankie reached for his cigarette-case from the wobbly bamboo table. He felt that he could breathe more steadily if he were exhaling smoke.

'Yes, but what are they doing? Why this horrible noise?'

Wongai shook his head tolerantly and smiled. 'How can I tell, Bwana? This is a wild, un-

civilised tribe. I do not know their customs. It is perhaps some sort of a dance. Some have got spears. Ah! there is the man the Bwana whipped this morning. He has recovered. He is laughing, and holding a spear.'

That brought Frankie to his feet. A slight, delicate, rather comical figure, in the usual dinner-dress of the African wilderness—pyjamas, long coat, shabby slippers—he pattered across to the aperture, shoved his servant aside, and peered cautiously out—not because he was afraid of a hurtling spear, but because, tenderfoot though he was, he had learnt that the white man must assume supreme indifference to native activities, and never be discovered displaying undignified curiosity.

A half-moon was rising, but it was mainly from the glare of a leaping log-fire that the white man was able to distinguish dark figures, naked except for red paint and feathers, crawling out of the huts and assembling, to the accompaniment of wailing chants and weird physical contortions, in the open space around the fire.

It was not easy to see how many carried spears, for the occasional gleam of metal was the only proof of their presence, but when Frankie espied a particularly unpleasant-looking savage waving a long sinister object, he withdrew his fair head as if he had seen enough, and went back to the deck-chair beside his own small fire of wood.

He made no attempt to relight his cigarette, but his quivering fingers did occasionally push over a leaf of the year-old magazine on his knees, in pathetic response to the insistent command of his mind that a white man must appear unruffled in the presence of his dusky fellows.

But, consciously, his brain was busy with only two things: fear, and a passionate, resentful protest that this should have come upon him. Fear, because he had a conviction that this unexpected outburst was connected in an unpleasant way with himself.

He had, in the course of his three months in tropical Africa, seen several tribal dances, but they had always appeared mild, amiable performances, utterly unlike this mobilisation of sound and ferocity. The flashing glimpse of that evil-looking creature with a spear, evidently in the centre of things, had supplied a reason for the demonstration. For that morning Frankie, roused to irascibility by the impertinent laziness of the work boys and his inability to end it, had shouted for the *kiboko*, and given the worst offender twelve strokes, while the rest of the camp stood round, a wide-eyed audience, watching with silent astonishment the administration of white man's justice. They did not, of course, know that such an action was as unusual to the white man as it was to themselves; that though they had come to railway construction, wild and undis-

ciplined, from their native reserves, so had he, as innocent and unsophisticated, come recently from the peaceful security of Hampstead.

Frankie had been distinctly uneasy for the rest of the day, because he knew that the Kisii needed careful handling, and that it was really the task of a veteran to realise the right moment to ridicule a defaulter, and the right one to punish him.

He recollected the boss's shake of the head and terse comments when the Kisii had first arrived. 'Tough nuts! They take some managing'; and also a gruesome story told him on the voyage of a wild tribe which had burnt alive a settler who had struck one of them. Consequently, when he saw in the centre of the yelling group the man he had thrashed, brandishing a spear, he understood that he had judged wrongly that morning, and that he was going to pay the penalty of his inexperience.

This unnerving conclusion caused the resentment which filled the other half of his mind. He had not sought this situation. He had never had dreams of his own heroism in times of peril—he was not that sort! Like most lower middle-class people, when he read tales of incredible adventure in British outposts he had been moved to admiration, but never to envy.

He had, indeed, ventured out to uncivilised Africa, but it had been a cautious venture, merely to serve in the office of a cousin in up-to-date, paved Nairobi, where nowadays the most timid of men live without fear. It was a mere trick of fortune that had flung him into the wilderness, to keep the camp accounts of a man on railway construction work, and had caused him to remain in charge of the section for a couple of days while his boss went to town, at the time when a particularly wild set of work boys had been newly imported.

But the monotonous chant, punctuated by shrieks, was the only response to his reflections, and the appreciative murmurs of Wongai at this unexpected and novel entertainment.

'What are they doing now, Wongai? It's a beastly row.'

'They are dancing, Bwana. That man with the spear is leading them. They are coming towards this house, but slowly.'

Wongai spoke with casual cheerfulness. Evidently the ominous character of the dance had not struck him.

Frankie shut the magazine with a flop, and uncrossed his legs. He must think this thing out. It was no good indulging in maudlin regrets and useless resentment. He must face the fact that in less than an hour he would probably be lying, stark-naked, in the forest, with the hyenas hurrying through the undergrowth to make a meal of him. The point was, Could he avert it; and if not, how could he play this part that he had never even understudied, to the credit of the name of Jinks?

He might try to bluff the natives into obedience by emerging from his house and in loud, authoritative tones ordering them back to their huts. But he knew that his tones were not authoritative. His voice was high-pitched, his pyjama-clad figure slight and unimposing. Probably a shout of derisive laughter would be the answer to this effort.

He might, again, fetch the 'three-nought-three' from the corner, and see what a volley of shots would do to intimidate them. But he had not handled a rifle a dozen times, and six misses would only rouse them to immediate action. Besides, he must not fire until he was absolutely certain of their hostile intentions.

Lastly, he might saunter forth, as if he suspected nothing, watch their antics, and then, if possible, engage them in conversation, trying to discover their particular grievance, and endeavouring, without lowering his prestige too greatly, to come to some sort of terms. But this course of action, besides necessitating a far more fluent knowledge of the Swahili language than he possessed, required a considerable amount of nerve, and Frankie's education had not included the training of that desirable quality.

So he continued to sit, a very frail youthful figure, by his fire until the logs fell together with a crash which made him jump so violently that he was obliged to get to his feet to prevent Wongai from perceiving the state of his nerves. He sauntered across to the window, and peeped out. The noise of the shrieking and chanting was now so deafening that he could not hear the words his servant shouted at him. He merely shook his head, and peered forth, hiding behind the rough *Americani* curtain.

The procession was approaching. In front of it, and running down the sides, were naked men, brandishing burning logs, which they had seized from their own camp-fire. Their fitful flames, and the showers of sparks flying from them, lit the scene with a fierce red glow, contrasting strangely with the cold, calm moonlight of the surrounding country. Those torch-bearers, who held no weapons, supplied the spasmodic yells that enlivened the performance, the main body being far too much occupied with its droning and dancing to allow of any spontaneous effusions.

There were three circles of dancers. The widest one contained very few spear-holders, and several unpainted men, all, however, performing the same weird, wriggling movement with the lower half of their bodies, in strict time to the chanting. The savages forming the next circle were all painted, and every other one was carrying a spear, while their physical contortions included a curious writhing movement of the shoulders. The innermost circle was composed of a dozen painted, decorated, hideous devils, each one waving a spear and contracting his

body into fearful contortions, thrusting his head back and forwards as he droned out the few notes of the chant that, in spite of its paucity, was oddly rhythmical. In the centre of this comely group was the man who had been thrashed that morning, capering up and down, evidently enacting some dramatic episode.

Frankie wondered if he ought to pray; but there was nothing he wished for, except the defeat of those devils, and his faith was not strong enough to believe that even the Almighty could accomplish that. He supposed that he ought to feel sorry for his sins, but he could not remember any worth troubling about. He felt much more sorry for himself, and resentful against the Power that had flung him without warning into this terrible predicament.

He had decided that when the procession appeared at his door he would go out, asking what was the matter; but when at length the moment arrived, and a horrible painted head appeared at the window, he found he could not do it. Every part of him was weighted and lifeless except his heart, which pounded against his ribs as if it would burst.

Through the mist in his eyes he saw the flash of the flaming logs; through the singing in his ears there broke the sharp sound of a loud, authoritative voice. Something seemed to melt in his brain—the yelling and droning took a fainter note—the light from the torches faded. The thud of British boots floated like exquisite music into his consciousness as a burly white man strode into the room.

The boss had returned!

Maclaren threw off his hat, glanced casually at the motionless figure by the fire, and stooping to the pile of chopped wood, threw on another log. He stretched his arms wearily above his head and emitted a yawning sigh. 'Hullo! got back earlier than I thought.'

Frankie's face was shaded by his hand. 'Yes.'

'So the Kisii have been entertaining you with a dance. Very kind of 'em, but the noise was a bit deafening! Quite interestin', isn't it?'

'I didn't watch it,' the assistant admitted.

'Well, you're cool for a fresher! Anyone'd think you were a bored old hand. One of their best shows, too! Circumcision festival for their tribe in the reserve to-night, so I suppose they thought they'd have a bust-up, too. Quite worth seein'.'

'Oh well . . . I was a bit tired.'

The boss pulled up the other camp-chair, and, dropping into it, began to feel for his pipe, whistling gently. 'Well, how's things? Weather's been good for the work. Got on all right?'

Frankie moved for the first time, and put his hand to his forehead, where perspiration gleamed. He brushed it away, smiling. 'Fine,' he remarked.

Chambers's Journal

SEVENTH SERIES

THE BALANCE OF THINGS.

By A. W. THOMSON.

YOU are 'only half of yourself. The other half is what you make of yourself, your personal significance in things, the Ego reflected as your contribution towards the general hurly-burly. Balancing each of these halves with the other purges life of the colourless outlook of its own non-stop march to the grave. In fact, life becomes quite rosy. It becomes an everlasting tinkering with something that looks like a pair of scales. You balance an ounce of personality by an ounce of something accomplished, an obligation to humanity by a cash receipt, a step backward by two forward, to-day, to-morrow, and the day after. The fascination of the game is a thousand times greater than that of the light for the moth. The problem of making and remaking, shaping and reshaping, that which you call your destiny, is the most delightful occupation between your first and seventieth birthdays. You are forever loading or unloading the scales. And the hard-worked pans no sooner balance than you set out to rebalance, in improvement, as you hope.

You cannot have both the penny and the toffee. Being human, you will not give something for nothing, and wild horses will not prevent you from taking the toffee. But, if you grasp both pans, you commit a sin against society, and are clapped into prison. On the other hand, if you decline to do any balancing because you want to stick to your penny, you are doing no more trade, or whatever may be your activity. If everyone stops dead in this fashion the world stops going, like a clock that has run down. What you must do is to balance and rebalance the scales a hundred times per day to suit a hundred exigencies, and again at night to suit the fellows who have tilted against you. This means that you keep faith with both nature and humanity.

You will perceive that this bag of pennies, toffee, morality, and jingling scales comprise the stuff of which life is compounded. As things naturally cannot stand still, but must ever go forwards or backwards, you really cannot cease dabbling with those scales. In three score and ten years you will have millions of balances to adjust and readjust. But, on one point you must be inflexible, to make sure the balance is dead true after each weighing, and before you start the next. When folk cannot or

will not attend to this point they are commonly described as having bees in their bonnets; or even more unsavoury epithets are applied. That the point is often forgotten is deplorable, but this is an imperfect world. In point of fact, quite a number of sound people at times find difficulty in getting the old scales to work properly.

Having read thus far of this paper you will be filled with two urgencies: first, to leave off juggling with those uncanny scales; and secondly, to deposit the writer in bedlam. The thing is impossible (the first urgency). The scales cannot be got rid of at any price. The practical man is never a profound theorist; likewise the fellow with a bent for mulling with his brains is not particularly effective in toiling with his hands. The artist is seldom a best-quality man of business; and the latter, being chock-full of affairs, has little time for artistical reflections. Now, to leave all these wholly lop-sided means that they may become something of a danger to society. The markets weigh out supply and demand. A surplus of enterprise in some people is weighed down by a deficiency in others. When a merchant makes much money his neighbour sets out in opposition; and two families now balance into competences. Also, as this balancing results in both becoming imbued with the preposterous idea that he is not making enough money, they fall to furious energy, splitting hairs, let alone tuppences, and to metaphorical murder. These are indeed naughty propensities, but redeemed by their virtue of getting the balancing and rebalancing of affairs to speed more merrily. You see that, unless you educate yourself in the use of the scales, you are likely to be out-classed by more vigorous manipulators. The wretched things are at your elbow whenever you turn, quite deafening in their clamourings for adjustment of the balance of the moment.

If you cannot acquire the knack of balancing things you are drifting towards becoming a public nuisance, or else towards the workhouse. The world is a confused medley of tits for tats, eyes for eyes, teeth for teeth, measure for measure, and pay and take (the parable of the penny and the toffee). Nothing stands without a prop. Everything has its value or counterpoise. You would think that the scales must be some-

what the worse for wear. Every moment of your life you must face the music, the other pan of the balance. There is no escape; it will get at you to restore the poise sooner or later, and somehow or other. From first to last you are in such a precarious position towards Nemesis that, compared with this peril, walking on a tight rope across a horrid chasm is child's play. The old scales garishly expose the trickshows of life. Truly the world is like an algebraical equation. Turn it how you will, side to side, top to bottom, it must come to some balance.

The bitter goes with the sweet. If you become a millionaire you must pay for the privilege in some manner. If you marry, as most people do, if only to be fashionable, the weight of a family may confer on you a permanent stoop. And such contraction presses on the organs and lessens your days. But, as there are balances within balances, the squashing of the liver, which is not a bad thing, may compensate for some of the annoyance to other bodily functions. Again, if you do not marry, and so keep a soldierly erectness until you become senile, your liver quite possibly may not get squashed enough. And you may be strangely tempered and something of an oddity. If you live a life of puritanical hue, you will, so some folk say, miss a lot of fun. If, on the contrary, you be a jolly dog, the game will certainly cost you some money in this life, and possibly endanger a reasonable insurance for prosperity in the next. The series of balances and counter-balances, bitters and sweets, and what not, is like a recurring decimal or 'Charley's Aunt,' both of which apparently are running forever. You cannot turn edgewise but you jostle against some kind of a balance demanding adjustment. You are eternally faced with such questions as 'This or That?' 'Are you or are you not?' The situation seems outrageous, and practical life a succession of forlorn hopes.

But the bitter need not invariably be an unpleasant accompaniment. It may indeed be indescribably seductive, like the bitter of beer, and other things. For instance, if the pleasurable vanity of a wonderfully smart new pair of shoes is balanced by pinched toes for a while, the prospect is really not so dreadful. The shoes will fit you in time, and the stricken toes heal. The healed toes now balance against shoes that have lost all their novelty, and some of their attraction. Again, when you take a wife, you take something with the bitter even more seductive than it is in beer, and certainly more camouflaged. Worse, you take the known with the unknown. Those features in your better half would make up an appalling problem, but for the fact that the same old scales once more save you. For, if she be known and unknown to you, you are the same to her, and, by a process of endless balancing and rebalancing, you eventually become quite well acquainted.

Then, if you happened to be brought up by parents who seemed to you unnecessarily harsh and rigid, as most parents were when the writer was a boy in Scotland, you will be aware that that had a balance too. You will see that, when one of a family goes awry, the others do well to give him no peace with their blistering tongues until they get him right again. The process really makes them all hang together. But, as no one ever can be perfect, something will always remain to be poised. And so life is a long, perplexing, muddling, and distracting adjustment of scales. The thing is worse than a thousand Chinese puzzles.

Yet there would be precious little spice without the scales; no excitement, no thrills, nothing to fling yourself against. And that would be a very sorry state of affairs, a perpetual boredom, ennui, a vast long yawn. Even the healthy excitement of making slightly more money than you require would lose its piquancy without the tit-for-tats with your competitors. But one, at least, of the interminable balances seems regrettable. It appears that love has some difficulty in living without hate. In the most intimate relations, even the depths of brotherly love, exists a slumbering jealousy. Yet, even here the redeeming feature emerges, crying to be weighed on its own account; and the very fact that your kinsman may be a potential policeman, if not a potential enemy, erects your guard. By the grace of God you go your way, but a human sentinel stands on your doorstep.

If you sit down with a bundle of foolscap and attempt to make out a list of the paradoxes and tit-for-tats that make up so much that is problematical in your own life, you are almost certain to conclude that the gods have ill-favoured you. With the fatuity of mankind you will probably blame everyone but yourself for the way things have panned out. You will frequently adopt the attitude of the fox towards the grapes to cover yourself. Yet you will perceive one great and unexpected blessing in the background. You will see that no man ever had a defect that was not somehow useful to him. As such unfits you for one purpose, so, in proportion, and by the use of those ancient scales, are you weighed out for another. The situation here has something of *noblesse oblige*, for your very infirmity imposes its obligations, its own balance.

That the gods never give their gifts with both hands is quite certain. Humanity is expected to balance the pans. We are given things in a hotch-potch, an exceedingly medley package, like a thief's loot sack. The job is to sort it out, weighing one thing against another in a way that will reasonably insure life going on in civilisation, sufficiency, and peace. Peace! That is the one thing, so far as you can discern, that has no balance. That is because it is not of this life, but of the next, where alone it can be given, but not taken away.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER XI.—*continued.*

HE laboured to follow with the same precision. The pool was easy enough except for the trailing of the rifle. The peat was straightforward going, though in his desire to follow his leader's example he dipped his face so deep in the black slime that his nostrils were plugged with it, and some got into his eyes, which he dared not try to remove. But the waterfall was a snag. It was no light task to draw himself up against the weight of descending water, and at the top he lay panting for a second, damming up the flow with his body. . . . Then he moved on; but the mischief had been done, for the sound of the release of the pent-up stream had struck a foreign note on the hind's ear. It was an unfamiliar noise among the many familiar ones which at the moment filled the corrie. She turned her head sharply, and saw something in the burn which she did not quite understand. Lamancha, aware of her scrutiny, lay choking, with the water running into his nose; but the alarm had been given. The hind turned her head, and trotted off up-wind.

The next he knew was Wattie at his elbow making frantic signals for him to rise and follow. Cramped and staggering, he lumbered after him, away from the stream into a moraine of great granite blocks. 'We're no' two hunner yards from the stags,' the guide whispered. 'The auld bitch will move them, but please God we'll get a shot.' As Lamancha ran he marvelled at Wattie's skill, for he himself had not a notion where in the wide world the beasts might be.

They raced to a knoll, and Wattie flung himself flat on the top. 'There,' he cried. 'Steady, man. Tak the nearest. A hunner yards—nae mair.'

Lamancha saw through the drizzle three stags moving at a gentle trot to the south—up-wind, for in the corrie the eddies were coming oddly. They were not really startled, but the hind had stirred them. The big stag was in the centre of the three, and the proper shot was the last—a reasonable broadside.

Wattie's advice had been due to his loyalty to John Macnab, and not to his own choice, and this Lamancha knew. The desire of the great stag was on him, as it was on the hunter in the *Iliad*, and he refused to be content with the second-best. It was not an easy shot in that bad light, and it is probable that he would have missed. But suddenly Wattie gave an unearthly bark, and for a second the three beasts slowed down and turned their heads towards the sound. In that second Lamancha fired. The great head seemed to bow itself, and then to fling upward, and all three disappeared at a gallop into the mist.

'A damned poor tailoring shot!' Lamancha groaned.

'He's deid for all that, but God kens how far he'll run afore he drops. He's hit in the shoulder, but a wee thing ower low. . . . We can bide here awhile and eat our piece. If ye wasna John Macnab I could be wishin' we had brought a dog.'

Lamancha, cold, wet, and disgusted, wolfed his sandwiches, had a stiff dram from his flask, and smoked a pipe before he started again. He cursed his marksmanship, and Wattie forbore to contradict him; doubtless Jim Tarras had accustomed him to a standard of skill from which this was a woeful declension. Nor would he hold out much hope. 'He'll gang into the first corrie, and when he finds the wund different there he'll turn back for the Reascuill. If this was our ain forest, and the weather wasna that thick, we might get another chance at him there. . . . Oh, ay, he might gang for ten mile. . . . The mist is a good thing, for Macqueen will no' see what's happenin', but if it was to lift, and he saw a' the stags in the corrie movin', you and me wad hae to find a hidy-hole till the dark. . . . Are you ready, my lord?'

They crossed the ridge which separated them from the first corrie, close to the point where it took off from the *massif* of Sgurr Dearg. It was a shorter road than the one they had come by, and they could take it safely, for they were now moving up-wind, owing to the curious eddy from the south. Over the ridge it would be a different matter, for there the wind would be easterly, as before. But it was a stiff climb and a slow business, for they had to make sure that they were on the track of the stag.

Wattie trailed the blood-marks like an Indian, noticing splashes on stones and rushes which Lamancha would have missed. 'He's sair hit,' he observed at one point. 'See! He tried that steep bit and couldna manage it. There's the mark o' his feet turnin'. . . . He's stoppit here. . . . Ay, here's his trail, and it'll be the best for you and me. There's nothing like a wounded beast for pickin' the easiest road.'

On the crest the air stirred freely, and, as it seemed to Lamancha, with a new chill. Wattie gave a grunt of satisfaction, and sniffed it like a pointer. He moistened his finger and held it up; then he plucked some light grasses and tossed them into the air. 'That's a merciful dispensation! Maybe that shot that ye think ye bauchled was the most providential shot ye ever fired. . . . The wind is shiftin'. I looked for it afore night, but no' this early in the day. It's wearin' round to the south. D'ye see what that means?'

Lamancha shook his head. Disgust had made his wits dull.

'Yon beast, as I telled ye, was a traiveller. There's nothing to keep him in Haripol forest. But he'll no' leave it unless the wind will let him. Now it looks as if Providence was kind to us. The wind's blawin' from the Beallach, and he's bound to gang up-wind.'

The next half hour was a period of swift drama. Sure enough the blood-marks turned up the first corrie in the direction from which the two had come in the morning. As the ravine narrowed the stag had evidently taken to the burn, for there were splashes on the rocks and a tinge of red in the pools.

'He's no' far off,' Wattie croaked. 'See, man, he's verra near done. He's slippin' sair.'

And then as they mounted they came on a little pool where the water was dammed as if by a landslide. There, his body half under the cascade, lay the stag, stone dead, his great horns parting the fall like a pine swept down by a winter spate.

The two regarded him in silence, till Wattie was moved to pronounce his epitaph.

'It's yersel, ye auld hero, and ye've come by a ground end. Ye've had a braw life traivellin' the hills, and ye've been a braw beast, and the fame o' ye gaed through a' the countryside. Ye might have dwined away in the cauld winter and dee'd in the wame o' a snaw-drift. Or ye might have been massacred by ane o' thae Haripol sumphs wi' ten bullets in the big bag. But ye've been killed clean and straucht by John Macnab, and that is a gentleman's death, whatever.'

'That's all very well,' said Lamancha. 'But you know I tailored the shot.'

'Ye're a fule,' cried the rapt Wattie. 'Ye did no siccan thing. It was a ver-ra deefcult shot, and you put it deid in the only place ye could see. I will not have seen many better shots at all, at all.'

'What about the gralloch?' Lamancha asked.

'No' here. If the mist lifted Macqueen might see us. It's no' fifty yards to the top o' the Beallach, and we'll find a place there for the job.'

Wattie produced two ropes and bound the forefeet and the hind-feet together. Then he rapidly climbed to the summit, and reported on his return that the mist was thick there, and that there were no tracks except their own of the morning. It was a weary business dragging the carcass up a nearly perpendicular slope. First, with difficulty, they raised it out of the burn channel, and then drew it along the steep hillside. They had to go a long way up the hillside to avoid the rock-curtain on the edge of the Beallach, but eventually the top was reached, and the stag was deposited behind some boulders on the left of the flat ground. Here, even if the mist lifted, they would be hid

from the sight of Macqueen, and from any sentries there might be on the Crask side.

Wattie flung off his coat and proceeded with gusto to his gory task. The ravens, which had been following them for the past hour, came nearer and croaked encouragement from the ledges of Sgurr Dearg and Sgurr Mór. Wattie was in high spirits, for he whistled softly at his work, but Lamancha, after his first moment of satisfaction, was restless with anxiety. He had still to get his trophy out of the forest, and there seemed many chances of a slip between his lips and that cup. He was impatient for Wattie to finish, for the air seemed to him lightening. An ominous brightness was flushing the mist towards the south, and the rain had declined to the thinnest of drizzles. He told Wattie his fears.

'Ay, it'll be a fine afternoon. I foresaw that; but that's maybe no' a bad thing, now that we're out o' Macqueen's sight.'

Wattie completed his job, and hid the horrid signs below a pile of sods and stones. 'Nae poch-a-bhuie for me the day,' he grinned; 'I've other things to think o' besides my supper.' He wiped his arms and hands in the wet heather and put on his coat; then he produced a short pipe, and as he turned away to light it a figure suddenly stood beside Lamancha and made his heart jump.

'My hat!' said Palliser-Yeates, 'what a head! That must be about a record for Wester Ross. I never got anything as good myself. You're a lucky devil, Charles.'

'Call me lucky when the beast is safe at Crask. What about your side of the hill?'

'Pretty quiet. I've been here for hours and hours, wondering where on earth you two had got to. . . . There's four fellows stuck at intervals along the hillside, and I shouldn't take them to be very active citizens. But there's a fifth who does sentry-go, and I don't fancy the look of him so much. Looks a keen chap, and spry on his legs. What's the orders for me? The place has been playing hide-and-seek, and half the time I've been sitting coughing in a wet blanket. If it stays thick I suppose my part is off.'

Wattie, stirred again into fierce life, peered into the thinning fog. 'Damn! The mist's liftin'. I'll get the beast ower the first screes afore it's clear, and once I'm in the burn I'll wait for ye. I can manage the first bit fine mysel'—I could manage it a', if there was nae hurry. . . . Bide you here till I'm weel startit, for I don't like the news o' that wanderin' navvy. And you, sir,—this to Palliser-Yeates—'be ready to show yourself down the hillside as soon as it's clear enough for the folk to see ye. Keep well to the west, and draw them off towards Haripol. There's a man posted near the burn, but he's the farthest east o' them, and for God's sake keep them to the west o'

me and the stag. Ye're an auld hand at the job, and should have nae deeficulty in ficklin' a wheen heavy-fitted navvies. Is Sir Erchie there wi' the caw'r?'

'I suppose so. The time he was due the fog was thick. I couldn't pick him up from here with the glass when the weather cleared, but that's as it should be, for the place he selected was absolutely hidden from this side.'

'Well, good luck to a.' Wattie tossed off a dram from the socket of Lamancha's flask, and,

dragging the stag by the horns, disappeared in two seconds from sight.

'I'll be off, Charles,' said Palliser-Yeates, 'for I'd better get down hill and down the glen before I start.' He paused to stare at his friend. 'By gad, you do look a proper black-guard. Do you realise that you've a face like a nigger, and a two-foot rent in your bags? It would be good for Johnson Claybody's soul to see you!'

(Continued on page 374.)

A QUEEN MARY MYSTERY.

By JOHN PRINGLE MILLER.

I.

NEVER in all the turbulent history of Scotland was there a time when so many tragic and mysterious events took place as in the reign of the unfortunate Mary. For the first time there was a queen regnant in Scotland—and the lawless and rapacious barons were not prepared to let such a fine opportunity pass without profiting thereby. All of them were greedy for wealth, and not a few for power. A surprising number of the greater nobles were itching to grasp the reins of power, either by marrying Mary themselves, or by getting rid of her by some more drastic method. Naturally, after her marriage with Darnley and the birth of their son James, those nobles who had aimed at gaining the supreme control of the kingdom became her deadly enemies—in which attitude they were in no way discouraged by Queen Elizabeth.

Secret intrigues, like the famous supper in Ainslie's tavern, were the order of the day. One could name a dozen such mysterious incidents. But, besides the more famous historical problems, there are darker and more mysterious happenings—happenings which touch Queen Mary with the greatest intimacy. I refer to the strange problems of the coffin in the wall of Edinburgh Castle, and the secret birth which took place in 1568, during the queen's confinement in Lochleven Castle.

The former problem has been very fully discussed, although there still seems reason to think that James I. was indeed a changeling;¹ but no historian of repute has been prepared to hazard his reputation in attempting to elucidate the Lochleven mystery. This is due perhaps to the fact that the evidence at present extant is of a very flimsy and unauthenticated character.

In order to understand the situation it must be remembered that at this time Mary was imprisoned in Lochleven Castle, and had just signed her deed of abdication. James, her

infant son, had not long been crowned king, and her bastard brother—the Earl of Moray—was regent. If James were to die, it was unlikely that the nearest heirs, the Hamiltons, would succeed to the throne of Scotland; in all probability Moray, Morton, or some of the other great Protestant lords would lay hands on the crown. Now if a child was born to Mary it would be the direct heir to the throne—whether it was male or female. Thus great issues were involved; and what makes this tragic little intrigue so mysterious is that obvious attempts were made to hush it up by the various parties concerned.

II.

Of all the strange secrets which surround the hapless Mary there is none of which we possess less evidence and around which romance has wreathed fewer legends. All the evidence at present known, which alone can prove that the birth actually did take place, is contained in two semi-contradictory accounts. Both versions were written by Frenchmen, and such evidence must be taken *cum grano salis*—as the saying goes—since sixteenth-century French historians are notorious for their appetite for the remarkable and mysterious. But the real strength of the case does not lie so much in the direct evidence, but rather in the indirect evidence, which proves that it was quite likely, and indeed highly probable, that a child was born at this time.

The evidence of the two Frenchmen is extremely short, and since we have no corroboration it can only be offered at its face value. The fuller account is to be found in the *Memoirs of Messire Michel de Castelnau*; and although Castelnau was a contemporary of Mary, his memoirs were not published till 1724. He gives no proof, but merely concludes his account of Mary's life with the brief statement: 'I shall conclude the history of Mary Stuart, after having said that she had by the Earl of Bothwell, her third husband, a daughter who became a nun in the convent of Notre Dame at Soissons.'

¹ 'The Mystery of the Coffin in the Wall,' by Dowager Lady Forbes, in *Chambers's Journal* for October 1923.

The evidence of the second, Claude Nau by name, is even more cursory. In his diary, discussing the state of Mary's health during her imprisonment, he remarks that she was suffering from loss of blood due, as he declares in an interlineation, to the fact that she had lately given birth to twins, who had been still-born, however. Nau was in a very much better position to know the real facts of the matter, since he was for a time Mary's private secretary. Almost all the information contained in his manuscripts was gleaned from Mary or from his own personal investigation, so it seems practically certain that he learned of the birth from Mary herself or from one of her personal attendants who was with her on Lochleven Island.

That is all the direct evidence which has remained to us after three centuries; but there is indirect evidence which is of almost greater importance. This evidence is not so directly connected with the case, for it in no way helps us to prove that the birth really did take place, but only that it was likely that a child should be born. But it is more authentic in that it is the statement of Queen Mary herself. It is to be found in a letter—the original of which is still in existence—written by Sir Nicholas Throckmorton, who was several times English Ambassador in Scotland between the years 1561 and 1567. In a despatch to Queen Elizabeth, dated 18th July 1567, he says:

'I have also persuaded her to conform herself to renounce Bothwell for her husband, and to be contented to suffer a divorce to pass betwixt them. She hath sent me word that she will in no wise consent unto it, but rather die, grounding herself upon this reason, that taking herself to be seven weeks gone with child, by renouncing Bothwell she would acknowledge herself to be with child of a bastard, and to have forfeited her honour; which she will not do to die for it.'

This evidence is of the greatest importance, for if it is true—as there seems every reason to believe—one can no longer reasonably doubt that the birth really took place. But the question now arises, Whose account are we to believe; or are we to believe either account? Claude Nau was only twice in Scotland, and then his visits were of short duration; so it is certain that he got his information from Mary or from one of the two *femmes de chambre* who were with her during her imprisonment in Lochleven Castle. Both the ladies, Mary Seton and Marie Courcelles, accompanied Mary into captivity in England, and must have known Nau well. But he cannot have heard of the birth till long after the event, certainly not until after 1575, which was the year he came over from France. Probably his information is of a very much later date, since his account

takes the form of an interlineation, added to his manuscript in a different ink. He dates the miscarriage of the twins as early as July 1567, while, as we have seen, Mary declares that she was only 'seven weeks gone with child' at this time. All things considered, Mary's statement made at the time from personal knowledge carries greater weight than Nau's, which was written down from hearsay over a decade after the event. There is every reason, then, to believe that the birth took place some time about February or March 1568.

Nau's account conflicts so much with Mary's own, and is so improbable, that it lacks conviction; so that, for want of other evidence, one is compelled to accept Castelnau's story. It is the more plausible in that a female child would stand a much better chance than a male one in escaping with life. Indeed, as most rumours have a certain degree of truth in them, it is highly probable that the child to which Mary gave birth was a girl. In any case this account must hold good till further and more authentic evidence is produced.

III.

It is significant that the birth was never once referred to in the correspondence of the period, and that the very existence of the child seems to have been a complete secret. It is only natural that Mary should desire to keep the birth secret. About this time, as we saw from Throckmorton's letter, the Scottish barons were trying to have her marriage with Bothwell annulled; and, in the eventuality of a divorce being granted, her child would become illegitimate and her own honour would be tarnished. Moreover, to make public the fact that an heir, or rather an heiress, had been born to the throne, and that it was a child of Bothwell, might well have cost Mary dear. Thus we can easily understand that Mary would wish to keep those who did not know of the expected birth ignorant of it; and 'at the same time to delude those who were suspicious that the birth had taken place into believing that the child had died at birth. This would explain Claude Nau's account, which is very probably only an explanation given to him by Mary after she had forgotten some of the real facts of the incident.

So well was the secrecy of the whole affair maintained that it might appear likely that the Earls of Moray and Morton and their partisans connived at the secret. Queen Elizabeth was aware that Mary was going to give birth to a child many months before the event took place, and we may be sure that she would quickly pass the news on to the Regent Moray—who may have already learnt of it from the captive queen herself. Mary was his half-sister, and at least one very intimate conversation took place between them during the queen's pregnancy. If, however, Mary's enemies did not

help to remove the child secretly out of the country, there is a faint possibility that Mary and her supporters were able to do it themselves. It is just probable that the child was born and smuggled out of the castle before her guardians were aware of anything unusual having taken place.

Controversialists still wrangle as to whether the queen's guards—who were almost wholly composed of the family and servants of the Laird of Lochleven—were tampered with or not. There is no doubt that Queen Mary during her imprisonment used all her guile in order to gain the sympathy and support of those around her, and that she was very successful too. We have evidence that as early as October 1567 the Regent and his supporters learned with dismay that she had 'won the favour and goodwill of all the household, as well women as men.' The household during the time of Mary's captivity was quite small, since the almost impregnable situation of the castle rendered a large garrison unnecessary. It consisted of the Laird and his family (which included his mother and brother) and some twenty servants. His mother, Margaret Erskine, a daughter of Lord Erskine, had at one time been the mistress of James V., by whom she had become the mother of the Regent Moray. She had afterwards married Sir Robert Douglas, and their son, Sir William, was at this time the Laird of Lochleven. The Laird's brother George, who was also the Regent's half-brother, resided in the castle at this time, as did a young foundling to whom the family name of William Douglas had been given. Sir William Douglas had married Lady Agnes Lesley, and it was the duty of this lady—together with her little daughter and niece—to keep a constant vigilance over the captive Mary. Indeed, in order to spy on all her actions, both of the children slept in Mary's chamber.

As I have said before, it is a well-known and admitted fact that before the end of 1567 Mary had captivated both the young girls, as well as George and Willie Douglas—the foundling. That they were all her ardent supporters there can be not the slightest doubt. Since they were able to contrive Mary's escape, it is not too much to expect that they could perform the much easier task of conveying the infant to the queen's adherents, who would, no doubt, be awaiting it on the mainland. We know of one person who would willingly have performed this service—and who possibly may have done it. She was a laundress from Kinross, who often came to the castle with clean linen and took away soiled. It would have been a simple task for her to smuggle the child out in her clothes-basket. Once the child was out of the castle the rest would be easy.

There is another and more probable theory, which presupposes, however, that the whole family took a more or less active part in keeping

the queen's *accouchement* secret. It is now generally admitted that the longer she was confined the more friendly the household became towards Mary, who encouraged the Laird and his mother with wildly ambitious hopes. The Laird himself never appeared to be much affected by her promises, or at least he never dared to show any changed attitude towards her. Nevertheless there were ugly rumours in circulation. The English envoy Drury wrote at the end of March: 'The Queen's liberty, by favour, stealth, or force, is shortly to be looked for.' We know also that Lochleven's own brother-in-law, William Lesley, declared that he (Lochleven) was brought before the Regent and reprimanded for promising to procure the queen her freedom. The stories sometimes included his veteran mother, Lady Margaret, who was also deeply implicated in the scheming. A contemporary writer, Sir James Melville of Halhill, writes in his memoirs that 'the auld lady his mother was also thocht to be upon the consail' which planned Mary's escape. By piecing together the various shreds of evidence which have from time to time become known, it is now quite clear that the whole Lochleven family was indulging in the dangerous pastime of running with the hare and chasing with the hounds.

This scheme, then, which was probably devised for keeping the birth a secret, was a tolerably safe one, which implicated only the Laird's wife. This would recommend it doubly to Sir William, who would wish to keep as clear as possible of all intrigues. It was a very simple plan, which merely consisted in the lady adopting the royal infant as her own child. Soon after the plans commenced to be laid for the queen's escape. Claude Nau tells us 'it happened very conveniently that the Laird's wife (whose business was to be the constant companion of her Majesty, and to act as her spy and keeper) had just given birth to a child.' Mary escaped from Lochleven Castle on the 2nd of May, but as the plans would take a month or two to evolve, this would place the date of the birth of Lady Douglas's child about February or March 1568, which we know was just about the time that Mary was expecting her child.

This is a remarkable coincidence, which becomes all the more suspicious when we read that the lady was Mary's constant companion, and would therefore more than probably be friendly to her. Again, we can prove nothing definitely, but this theory seems to solve the most difficult problems of this mysterious little incident.

IV.

The whole affair is exceedingly dark and mysterious, and will most probably never be fully explained; the deliberate attempts to hush up the whole story militate against any further evidence being brought to light. That the child was born is practically beyond doubt, if Mary's

declaration to Throckmorton is to be believed. Yet there is something grim and incredible that a child should be born and should live, and that its very existence should remain a most profound secret. There can only be three explanations of the entire mystery: firstly, that the child or children died or were murdered at birth; secondly, that the child or one of the children did survive, to become a nun in a French convent; and lastly, that there never was a child born at all.

Any of the three explanations is possible, and the first would certainly have been the best if there was any corroborative evidence—but there is not the slightest fragment. So far as is known at present, Queen Mary never made any statement in reference to the birth, and one can understand that she would not be well able to know much about it. She would not be in a state to judge whether the child, or children, were dead when born, or if they were murdered and thrown into Lochleven immediately after their birth. But we can discount Claude Nau's story entirely, for his statements conflict. He declares that the twins were the fruit of Mary's union with Bothwell, but dates the miscarriage so early in 1567 that they must have been by Darnley. At the time of this event Darnley was but five months dead, according to Nau; and no one has yet accused Mary of gross immorality. The story of the still-born twins, therefore, can be ignored, with the rest of his account. That the child was murdered as soon as it was born is more probable.

Moray and the lawless barons who supported him would be only too pleased to get rid of the child so surely and secretly, since the queen, and even Bothwell, had still a large number of adherents in the country. Of course the child might have been killed by Mary's own attendants, in the view that it was to their mistress's benefit to do so.

With regard to the second theory and the truth of Castelnau's account one can say nothing, as the source of his information is unknown. Certainly Castelnau held a high position in the French diplomatic service, and besides having secret knowledge, he was in a position to verify his statements by consulting the registers of the convent of Notre Dame at Soissons, and to make sure that it was really the daughter of

Mary Stuart who had been a nun there. All the reliable evidence we possess tends to prove that this is the correct explanation, highly improbable though it seems.

And lastly, there is the theory that no child was ever born, and that the whole affair is only a myth. It is indeed possible that Mary, in order to prevent herself being forced into divorcing Bothwell, deliberately told her enemies that she was pregnant when she was not. She was a pious Catholic, and would therefore have a great and natural repugnance to divorce; besides, it is quite apparent that she still harboured a great affection for Bothwell. Her plea that she was about to give birth to a child was certainly believed at the time by her captors, and proved an excellent defence. As to the veracity of Nau's account, he, as Mary's confidential secretary, would do his utmost to shield his mistress, and to improve her cause in any way he could. That a birth was expected was quite sufficient to hold up the proceedings for divorce; while the fact that the children were dead would in no way hinder her actions towards further matrimonial ventures.

Thus there are two contradictory theories, one of which declares that there never was a birth at all, and that it was Mary who spread the rumour of a miscarriage to suit her own ends; the other, however, argues that a child was born, but that all information concerning it was deliberately and systematically suppressed. These conflicting views are entirely due to lack of evidence, for contemporary events make any one of the various theories quite plausible.

Yet in spite of all our theories we are compelled by this lack of evidence to return to our starting-point. We cannot doubt that the child was born, but beyond that we can be sure of nothing. We must accept Castelnau's account, for although not the most probable, it is the only explanation about which we possess any evidence worthy of credence.

In conclusion, if the child was born and entered a convent, as we must perforce believe, surely this must have been the most unhappy princess that ever lived. She came into this world unwelcomed, lived unbefriended, and dying vanished, scarce leaving a trace on the dim pages of history.

THE YELLOW FIELD.

PART II.

II.

FOR a little space I continued standing, with enough returned reason to meditate on what was past, but with not enough to think on the present, save that (though dully) I knew now that the water-spears could not help me,

and believed I knew that I should be dead not many minutes hence—for I would fight *them* into killing me.

The sky above the slope's rim was very blue, with here and there a wraith of brown cloud—the last of the rain clouds. The sun was falling hotly upon me. Presently I felt sickness, and

saw that the slope's crest seemed to swing against the blue sky. Whereat I sank down on one knee and there remained, pressing a hand on my wound (beginning to stiffen) which I had hurt in kneeling, and holding my pistol in my left hand. Anon I looked down at the pistol, feeling some wonder that I had clung to it through all my terror and my running. And 'twas as I stared at its blued steel barrels, blotched by mud and water, that, suddenly and completely, my true, proper senses rushed back to me, with two questions as their vanguard. *'Why had I not thought to recharge the pistol?'* *'What—fool that I was!—did I here in this pit, whence I could see nothing of the enemy till they were right above me, to their increased advantage?'*

Taking my hand from my wound, wiping it across my coat, snatching forth my ammunition purse, I recharged, reprimed, swiftly, tremblingly; then, with hammers acock, I got upright, and, with my feet agonising me, walked, teeth-clenched, to the yellow slope and upward nearly to the brim, lowering to hand and knees then, crawling, and bringing my eyes over the brim, a little higher than the grass and flowers—noting, as the first of those things which I had been too sightless to know of when I came to the hollow, that I had drawn very close to trees and rising ground. The space of pasture nearest to me, which I must have lately traversed part of, was as yellow with flowers as the slope I was on, and was marked as a field by some lines of little shrubs and sproutlings, with intervals betwixt many of these, planted to form hedges, when they should grow. Beyond one of these toy hedges I saw, amid trees, a roof and chimneys. Moving my eyes I beheld, just beyond the next hedge, the brown of a road that passed into trees—my Hastings road. Lifting higher, to sweep a glance for my enemies, I looked to a third side of the field—and in an instant my heart had leapt hard and was racing hard, because of a great sweet hope—gladsome beyond telling—which had taken possession of me. For, beside the line of plantlings which stood for the third hedge, I saw a horse—a gray, with a cloth on his back and a bridle on his head; a woman's figure in a pale dress, white or primrose, holding his rein while he cropped—so that I might have believed she waited for me with the means to save me.

They were not two hundred paces from me—she and the horse. I rose to my feet, stepped clear of the hollow, then waited to look behind me. The end had been very close. It sent me cold, with my breath stopped, with much of my fear returning, to see how close. Only a little way from the farther side of the hollow were standing two soldiers and the blue-scarved, square express, with two men in farm clothes—their faces all from me, though, as they waited

to speak with divers others, farm men and a soldier, who were coming from another point, straggling by twos and threes.

I whipped my eyes from them and ran, very stumblingly and weakly, towards the horse, believing I should hear a shout and a shot, but hearing neither. I drew close, discerning that the woman had not seen me. Her face was a little aside, she being intent with watching my foes. I perceived that she was very young—a girl, with dark hair showing at the edges of her summer hood, which, like her gown, was of a pale primrose.

The gray horse, suddenly aware of me, threw up his head and backed blowing, having lifted the maid's hand, holding the rein, high, and having drawn her back with him—and now she set eyes on me, ten yards from her. I saw her eyes, shining and blue, turn large with quick affright, saw a fluttering of fear about her mouth and nostrils, saw that her face had fallen white. I pointed my pistol well to the earth beside me, ceased running and walked, holding out one hand. 'Give me the horse,' I said. Then, she stepping backward and roundwise with the gray to avoid me, I ran again and took hold of the rein. The gray lifted, bringing her against me for an instant, our faces well-nigh touching. Then, kicking, the gray backed yards, but came to a stand under my hard pull; and she and I stood facing, her expression all great fright and loathing at the thing of mud and blood that I was, but her grasp on the rein as firm as mine.

'Give me the horse,' I said again. And then, seeing only fear, wide-nostril'd fear, and loathing in her face, I pleaded: 'Oh, madame, I mean you no hurt. They are after me—look you.' And myself I looked back to the enemy—seeing them astand with every of their faces turned to us as though, having just noted me, they were uncertain that I was their man. 'Give me the horse,' I pleaded, looking at her, wondering that she did not do so.

'Nay, nay,' she answered, her lips trembling, but her eyes a little recovered of their affright. 'Nay, he is sick. You would kill him to ride him. Go to my father—in the house yonder. He will parley and help you if you are a worthy man. You cannot ride Michael.'

'Nay, I must,' I said, 'to save my life.'

Renewed fear came to her eyes. Fear for the horse—I thought; since a kind of anger was with it. 'You shall not kill Michael!' she said breathlessly. 'Go to my father. You shall never kill Michael!'

'I pray you unloose him,' I entreated, pulling the rein a little; she pulling it back.

She answered in determined way, though her voice was trembling fast, 'He is sick. You shall not have him!' And her blue eyes, in anger and fear, strove to make me accept that answer.

I looked over my shoulder ; for I had thought that I heard voices from the enemy ; and, sure enough, they were streaming forward to examine me, the express and a soldier leading at hasty pace.

'Oh, unloose, madame,' I said. 'What are you thinking of? 'Tis my life you are holding from me!'

'Go to my father,' she said again swiftly. 'You shall not take Michael's life—you that are the greatest villain perhaps. . . . Nay!' she cried in wild apprehension, her eyes desperate—as I wrenched at the rein. And she set both hands to it.

I stooped to lay my pistol in the grass—for, with what I meditated, 'twould be dangerous cocked in my pocket. Straightening, I drove my arm around her ; and, thrusting the rein one way, I sought instantly to swing her from it and break her grip. She was but lightly formed—a young girl withal ; yet, from my sorry, weak state, I could not break her grip.

She was crying aloud in a sobbing fashion for some one to aid her, breathing wildly within my arm, and striving, by turns of her body, to free herself, yet holding, both-handed, to the rein ; while the gray, blowing, lifted so hard that I was afraid the whole head-harness, which seemed but loosely fastened, would slip off him, and I thus lose him. Yet 'twas one of these liftings that gave me my advantage. The force of it tore the rein from one of her hands ; and as she strove to grasp again I swung her athwart my hip with well-nigh my last strength, breaking the grasp of her other hand and casting her clear from me so that she fell amid the flowers and grass, as I had meant for my better safety—truly the villainest thing I had ever done, I thought, as I saw her primrose hood and gown lie still for a bare second amid the yellow-and-green ere she raised her head.

Dizzy from pain, for I had drawn her across my wound, I snatched for my pistol in the grass, but the gray pulled me from it, and I left it, for I had no strength or time to fight him over this, with another struggle before me—that of mounting him without a stirrup, which I half believed I was too weak to accomplish.

Letting him pull me a few paces, speaking to him, soothing him, I brought him to a stand, came beside him ; then, passing a hand through the rein-loop, I gripped his mane, and thrust a hand across his back, and lifted myself from the ground, and hung while he wheeled. And, since 'twas my life that hung thus, I found a final strength, and, after a moment, was asprawl on the cloth on his back, and then sitting up, throwing the rein into position—but feeling myself so ill that I thought to fall from him.

The gray had brought me facing her. She was standing now. She stretched her hands

out to me ; and I saw tears shining down her face, saw how her lips were shaking. She strove to speak, ran two or three steps toward me, stopped, and spoke, her voice scarce more than a moan. 'Get down!' she said. 'He is mine—my poor Michael, that I love. You will not take him from me to kill him!'

I could but refuse her by a shake of my head, and turn the gray toward the road. I sent him forward with a twitch of the rein and a slap of my palm, hearing her cry out most piteously at the slap—but I had seen that the express and sundry others were past the hollow now, and running. And, indeed, as I steadied the gray to take him through the plantings on to the road two musketoon balls clipped the twigs beside us, and the musketoons roared. Then the gray and I were on the road and almost instantly hid by trees.

I rode him but gently after a little, believing from what she had said that he was heart-strained, but finding him very willing to go. Presently, having been looked at with extreme curiosity by several persons that I met on the road, but having been offered no hindrance, I turned on to the turf which ran to the cliff-top above my fisher-boat, with no man in sight now save Collins the fisher-captain, in his rough shirt and skirt, who had climbed up to watch for me, the wind being of good strength by this.

I was safe, safe ! With full force that knowledge came to me now—that, under Providence, I was to see St Germain woods anon and have my homecoming. I could have shouted frenziedly for gladness as I waved my hand to Collins, who had not known me in my disarray. I could have gabbled, even screamed—I do remember.

To master my emotion I dropped my hand and stroked the gray's neck as he trotted. I wondered how I could best leave this friend Michael secure for his mistress to find—tethered to a stake, or wandering cropping at the grass hereabout? And then, in a flash, the green ground seemed flung up at me, and I discovered myself lying on it, thinking surprisedly that this was the second time to-day I had been cast from horse. When I picked myself up I saw Michael lying on his side, with his gray neck far out-stretched on the grass—dead. And I lost much of my gladness from thinking on what the girl would say.

III.

The newspaper, the *Morning Mercury*, which reached me at St Germain on the 5th day of August had travelled by various hands ; and I knew not whose hand had written the superscription, containing my name, upon the paper that wrapped it about—

GIVE TO THE HONOURABLE MR HENRY JERVOIS,
WITH KING JAMES,
ATT S. GERMAIN-EN-LAYE, IN FRANCE.

I unfolded the newspaper and perceived that some one, by drawing thick lines with ink, had marked a piece of intelligence for my notice—which intelligence I forthwith read, it being this:

'It is now believed that the second person concerned in the late felonious attack upon one of Their Majesties' Admiralty expresses between Bourne and Hastings was the Honourable Mr H. Jervois, Lord Ferristown's son; for 'tis ascertained that Mr Jervois was appointed to meet with Sir Eves Culloch, the one of the two villains who was shot dead, near the place of the attack. As was told last week, Mr Jervois (if 'twere he) made good his escape, being enabled to do this by the act of a young lady who gave him a horse.

'The expectation that this lady, who hath been committed on a Privy Council warrant to Hastings jail for her act, would be indicted and brought to trial was yesterday proved well founded, it becoming known that she is to be put to trial at a Sussex assize in August on the charge of treasonously aiding an enemy of Their Majesties to escape after active treason in arms. Whereby she is now in danger of her life, since, if she be pronounced guilty, she will be sentenced to die.

'She is Miss Herbert, daughter of Morgan Herbert, Esquire, of Stanningly Manor, Sussex, and is eighteen years old. She is said to plead that Mr Jervois took the horse from her by force. To-day 'tis common opinion that, would Mr Jervois appear at the assize and make testimony of this, he would be like to clear Miss Herbert of the accusation. But 'tis by no means sure that Mr Jervois, who is thought to be at St Germain, will learn of her unhappy and perilous circumstance—and, if he should, there is no reason to conclude that he will abandon his safety and yield himself to the law by coming hither to protect Miss Herbert.'

'Twas on the terrace, in bright sunshine, that I read this—with a sense, as I began it, of being carried back to a thing that had been left far behind in the past and was almost forgotten. For, with some weeks of ordinary life at St Germain intervening, together with some days of great stir, occasioned by the King of France and his court coming to us for the baptism of His Majesty's and the Queen's little daughter, my mind had been much lulled and distracted from that desperate, fugitive morning of mine in England, which all this was so different from, and soon I gave not much thought to it—scarce any at all, when my wound was healed past reminding me.

But—what need to say?—ere I had read many lines of the newspaper, that morning was as clearly lit in my memory, was as present to me, as if it were to-day. Indeed, for a space, 'twas verily as though I yet stood in that

yellow-flowered field, with her little hand holding Michael's rein, and her blue eyes on me as she told me (truly indeed) that I should kill Michael by riding him.

It seemed strange to me, as I held the newspaper after reading, that I had not thought of her more since reaching St Germain—that I had not sought (though I knew not her name till now) to send her some word of sorrow anent Michael, whom she loved—and she but eighteen.

But what time was this to think of Michael! 'Twas easy to believe that the authorities, who already had shown themselves so spleenful to her, would see that she suffered death if she were sentenced to it. And this my fault—she the innocentest creature, as those spiteful, false-swearing blackguards, the express and his rabble, must have seen for themselves.

I crushed the newspaper, dreading that the assize had been already held, yet having one errant thought, namely, that I fain would flail my cane upon that knave writer, who, with curious malice, taunted I should not come.

Turning into the château, I craved admittance to His Majesty, who, I knew, was in his cabinet; he presently receiving me, and giving me leave to go away on a private matter, whereof he asked no particular question—to my relief; for, had I been forced to tell much, he, in his kindness, might have commanded me not to go.

Then took I farewell of my mother, telling her—dear heart—no more than that I wished to make my duty to a lady, who was distant—whereat her mien, though wondering (wondering what French mademoiselle this could be), was in no wise unhappy. And then—my father being away at Fontainebleau—I straightway rode from St Germain for the coast.

My spirits were overcast from my leave-taking of my mother so deceived; and, as I journeyed, the more and more did they become overcast by apprehension that Miss Herbert's trial had already taken place and gone ill for her. But I found I had no fear for myself, to make the shadows blacker, though truly it seemed I was going to my death.

Though I had borne myself with excellent calmness at St Germain to-day, in reality my mind was all turmoil and astoundment from learning that I had brought this young lady to peril of death, but I perceived one thing in a clear, steady way—namely, that, with all my heart, I would be glad to die, rather than to live remembering I had cost this maid her life. In sooth I could not endure to live knowing that. Wherefore there was no room left for any fear for myself in this errand of mind to save her. I knew that I should be a proper man throughout the errand—unless I came to England too late.

(Continued on page 377.)

SCENES FROM MOROCCO—FEZ.

By E. C. MATTHEWS.

PART I.

I.

A CHILD of perhaps ten summers took me in hand during my first visit to Fez, and decided that it was his obvious duty to show me the wonders of his native city. I have a strong dislike for the whole race of guides, but Mohamet b'el Abdelwah'h'd was no ordinary member of that fraternity, and as it is quite impossible for a stranger to avoid losing his way in the crazy labyrinth of Fez, I was content to surrender to the whims of this infant. He rarely adopted any suggestion of mine, but firmly went his own way in his own time. Occasionally I expostulated, and at first Mohamet treated my protests with tolerant amusement. Finally, however, he delivered a crushing rebuke. I was in a hurry to get back to my hotel in time for lunch, and told him to take me there as quickly as possible. He led me out of one of the gates of the city and along a tortuous, cactus-edged path, through olive groves and fields of maize. It was a roundabout route, and, being hungry, I asked him irritably why he had brought me that way. There was contemptuous pity in his voice as he answered, 'To give pleasure to the eyes.'

With this quaintly-worded phrase did a diminutive child of the East pass criticism on Western civilisation. In the West we have subdued the forces of Nature and produced much remarkable machinery, but Nature has taken her revenge and made us the slaves of our own time-tables. The first man lost Paradise by eating the fruit of the tree of knowledge, but of all the sons of Adam the Arabs have remained the nearest to the gates of their ancestral home. The more inquisitive races are ever striving so hard towards fresh discoveries, that they have no time to spare for contemplating the finished perfection of Nature.

In and around Fez it is still abundantly possible 'to give pleasure to the eyes,' but it was not until my seventh or eighth visit that I discovered the ideal spot from which to gaze down upon that amazing city. As to the exact position of my vantage-point I intend to maintain a jealous silence. The fairness of Imperial Fez is too rare to be subjected to the unmannerly staring of the average tourist. It is more seemly that, like some veiled Mohammedan maiden, she should only reveal the glorious beauty of her face to her chosen lover and his nearest relations. Suffice it, therefore, for me to explain that somewhere in a hill to the north of the city is a small cave, and by the merest

chance I discovered its obscure entrance. I like to imagine that Fez, knowing me to be an ardent and respectful lover, had rewarded my devotion, and shown me how, in undisturbed tranquillity, I could contemplate her perfect beauty.

The tiny entrance to the cave is on the top of the hill, and, when first I saw it, appeared to be a mere hole in the ground. Exploration, however, revealed a precipitous, narrow passage leading down to an opening in the cliff-face of the hill. Down the steep slope two friends and I stumbled in the darkness, till we reached the cavern from which there is the most perfect uninterrupted view of Fez. The almost unearthly beauty of the scene before us held all so spellbound that none ventured to break the silence, and none was conscious of another's presence.

It was but a few minutes before sunset, one glorious December evening. Not one cloud was to be seen in the gradually paling blue sky. In the valley some 200 feet below us were olive trees and straggling cactus plants, and a small field of young green corn. Narrow pathways edged with aloes pursued their somewhat haphazard courses, and along one of these came an Arab boy driving a small herd of goats towards one of the gates of the city. He was playing softly to himself on a native two-stringed instrument, and the plaintive notes of his melancholy tune rose up to us through the stillness of the evening. Beyond the gardens—for in Morocco every place where green trees are to be seen is called a garden—lay the venerable city. In the background rose a line of hills dotted with olive trees, to the east the road to Taza threaded its way through the plains to the mountains beyond, while to our right the westerling sun was sinking in a blaze of glory.

Old Fez, founded in the ninth century, lies mostly in a hollow, though the western end has clambered up a hill, where the palaces of the wealthy overlook the lower portions of the old town. In the centre of Old Fez is the great mosque of Moulay Idriess, with its green tiled roofs and its aged minaret. Until recent years a 'forbidden quarter' surrounded this greatly venerated mosque, and death was the punishment for any infidel found upon that holy ground. To the west of Old Fez the imperial quarter—the narrowest portion of the city—joins the old to the new town. In this quarter are the Sultan's palace, the Sultan's mosque and government buildings, and from above we could clearly see into their gardens and spacious courtyards.

New Fez, dating from the thirteenth century,

contains some streets wide enough to drive through, though the numerous internal gateways placed at awkward angles render the process somewhat trying. The whole of Fez is enclosed by crenellated gray walls, with defensive turrets at irregular intervals, and in the whole seven odd miles of ramparts there are only ten gates.

As we looked down upon it from our cave, the city seemed wrapped in a mysterious silence. There was no clamorous noise of modern machinery, not even the rumble of traffic, nothing but the gentle murmur of human voices. Not a street was visible, for the tortuous alleyways of Fez were all hidden by the confusing mass of houses. Here and there specks of colour could be seen as Moorish women came out upon the flat roofs of their houses. The fast setting sun cast a soft radiance over gray Old Fez, so that we seemed to be looking down at some dream-city fashioned out of mother-of-pearl.

Abruptly the silence was broken by the loud report of the sunset gun; and before the sound had ceased reverberating amongst the hills began the evening call to prayer. Starting from the Mosque of Moulay Idriss, the shrill cry was taken up and passed from minaret to minaret, till the whole valley was filled with the sound of men's voices proclaiming the greatness of God. It was fully five minutes before the last echo had died away and the city had fallen once more into silence. The sky behind the hills to the south rapidly changed colour. Deep red gave way to rose, rose merged into pale yellow, with here and there a hint of green, while the delicate evening blue gradually deepened towards the east before the steady advance of oncoming night. The hills, now in deep shadow, took on a vaguely purple hue; an evening mist began to form in the valley, and the colour of Old Fez in the twilight resembled that of the outside of an oyster shell.

I shut my eyes and tried to force my brain to retain every detail of that magnificent scene; then, turning round, I found my way up the dark passage, out to the summit of the hill. Not till we were all outside did any one of us break the silence, and even then we spoke only in the low, awed tones of those who have seen wonderful things.

II.

We had all lived some time in Morocco, and had, in consequence, got to know a certain number of Moors, and we had received an invitation to dine that evening in an Arab house. At about half-past seven one of our host's black servants, a freed slave, came to conduct us to the house. Carrying a small Arab lantern, he led the way through the narrow, tortuous streets of Old Fez. Some were dark and deserted and a little eerie; in others lights were to be seen, where a few

Arabs still remained in their shops. At night the blank walls of houses towering high above the murky alleyways look mysterious and almost ominous. They all appear somewhat mean and shabby, for the Moors pay no attention to the exteriors of their homes; and for this they have two good reasons. The first is that they live inside, and consider it a waste of time and money to adorn the outside; the second and more important reason is, that in the old days an expensive-looking exterior to a house might have attracted the attention of some rapacious governor, or perhaps the sultan himself. As a result, even in the quarters where the richest Moors live, the European at first imagines himself to be in some dreadful slum. When we arrived at the house we passed through a modest doorway, along a dark passage, and into a magnificent courtyard.

The change from darkness, poverty, and squalor to light, splendour, and luxury was so startling as to be almost theatrical. To us Europeans it looked at first like a stage-setting for a scene from the *Thousand and One Nights*. I for one should hardly have been surprised had Haroun el Raschid appeared, accompanied by Giafar his vizier and Mansour his sword-bearer.

The courtyard was about twenty yards long and fifteen wide, and was paved with white marble tiles laid diagonally and edged with blue. In the middle a fountain played lazily in a shallow alabaster bowl, and beside it grew a jasmine bush then in full flower. Round the courtyard ran a covered arcaded passage with a ceiling of painted cedar-wood, and along each side was a row of massive columns. To the height of about five feet the walls and the columns were inlaid with richly-coloured mosaic work in conventional Moorish designs. Above this was plain white, but the capitals of the columns were decorated with filigree carving in plaster, and no two were alike.

At the far end of the courtyard we could see through a Moorish archway into a brilliantly-lighted room, where dinner was shortly to be served.

As we arrived, our host advanced to meet us. He was a magnificent specimen of humanity, tall and dignified. His skin was almost white, and his face bearded; his features were clear-cut, and his eyes keen.

After the customary greetings he led us to the room at the end of the courtyard, and there we found his uncle, an ex-minister of justice, who was to do the honours of the feast. In this particular household it was the host's custom not to dine with his guests, but personally to supervise every detail of the dinner. We took our places on a large divan, and, propped up with many cushions, sat in an incomplete circle, the unoccupied portion being for serving purposes.

To begin with, tea was made in the usual

Moorish style, with considerable ceremony. Green tea was used, and the pot nearly filled with enormous pieces of sugar from a sugar-loaf. A good handful of mint was then put in, and the pot filled with water which had been boiling in a magnificent samovar. With the tea some most delicious almond-cakes were served; and there was a great temptation to spoil a good appetite by over-indulgence in these dainties. One variety was infinitely delectable. In the form of a crescent moon, the inside was made of almond paste; this was covered with the finest pastry, and the whole powdered with the kind of sugar usually found in boxes of Turkish delight. After each guest had drunk three cupfuls the tea was removed, and a procession of servants appeared in the courtyard carrying a number of dishes. There were twelve courses, each in a large earthenware dish covered with a conical lid of parti-coloured basketwork. The servants laid these dishes in a row in front of the fountain; and a small round table, not more than nine inches high, was placed in the midst of the guests. Two servants then brought a copper bowl and a kettle of hot water, and we all washed our right hands. After this the first dish was carried in, and, on the cover being raised, a magnificent 'pastella' was displayed. It was circular, about two feet in diameter and an inch and a half in depth. The outside was of the lightest pastry imaginable, and the inside of tenderest roast pigeons. We ate it native fashion with our fingers.

There is a tendency amongst Europeans to consider this an ill-mannered method of conveying food to the mouth. It is therefore salutary for us to ponder for a moment over the Arab point of view, which is that ours is an unclean way of eating, for it is impossible to tell who last used your spoon or fork. Those who have taken their meals with any frequency in the smaller restaurants of Europe will admit that there is much to be said in favour of this Moorish contention. It must also be borne in mind that, except when eating kous-kousu, well-brought-up Arabs consider it bad manners to dirty more than the tips of the thumb and first two fingers of the right hand. On no account should grease penetrate beyond the top joint of the fingers. Meat retains the heat far better when it is not cut up into small portions, and, to me at least, roast mutton never tastes so good as when torn in small pieces from a whole sheep. Many a time have I proved to my own satisfaction the literal truth of the old proverb, 'The nearer the bone the sweeter the meat.' There is a remarkably succulent morsel clinging to the backbone of a sheep, and this is seldom, if ever, tasted unless first pulled away with the fingers.

For a period of nearly two hours dish followed dish, and each in itself was a culinary triumph.

There were five courses of chicken, and five chickens to each of these courses. Chickens boiled with maize and flavoured with mint; roasted and served with olives; spiced with cummin seed and cooked in oil; dished up with salsify and yolks of eggs; stuffed with raisins and pounded almonds. This last I would especially recommend to the attention of the fastidious gourmet. There was a sheep roasted whole with a plentiful stuffing of cummin seed; and I must confess that whenever this dish has been placed in front of me, I have always endangered my capacity for eating anything else which might follow. There was a form of stewed mutton served with a variety of vegetables, and, to complete the more serious part of the feast, there were two courses of pigeons admirably cooked.

Throughout the dinner musicians sang to us or played on curious native instruments. Arab-singing is decidedly strident in tone, and, at the first hearing, somewhat displeasing to European ears. The songs were mostly of love or adventure, and the words were in the usual Eastern form of couplets repeating one general idea in different phraseology. As a rule a man and a woman sang alternately, and the following will give an impression of the type of song.

The man sings :

When first I saw the radiance of my beloved's face,
I thought I was gazing on the full moon in the
month of Ramadan.

I said, 'Surely such human beauty was never seen
till now';

And I said, 'The works of the Creator are perfect
beyond understanding.'

The woman replies :

There is a soft down upon my lover's cheek,
And his eyes can be gentle as a young gazelle's;
But his strength is greater than the lion's,
And as a warrior none is his equal in valour.

The instruments used by the musicians were a kind of mandolin, and a violin keyed down to an unusually low pitch. This instrument, instead of being held to the shoulder, was played in the manner of a double bass. A species of native drum was also used. This was composed of a piece of pottery in the shape of a straight vase, the bottom being replaced by parchment which had frequently to be heated over a brazier in order to maintain the desired tone.

The two final courses of the dinner made us wish they were not the eleventh and twelfth, for their excellence was beyond praise. One was an enormous flat round piece of pastry filled with almond icing; the other was a sugared kous-kousu. This latter is the staple Arab dish. It is composed of a form of semolina, and in this case raisins were added and the whole covered with a fine powdered sugar. The method of eating it presents considerable difficulties to the unpractised Westerner, although it is permitted, and indeed necessary, to use

the whole of the right hand. The correct way to set about it is first to scoop out a small handful, then by a curious circular, jerky movement to make this into a ball about the size of a walnut, in the palm of the hand, and finally to slide the ball with the thumb up the first and second fingers into the mouth. To become efficient at this pastime requires long and careful practice.

After the kous-kousu the copper kettle and bowl were again produced for very necessary ablutions. The remnants of the feast were handed to the musicians, who certainly deserved refreshment after their strenuous entertainment. Finally the various dishes were passed on to the remainder of the household, who were doubtless waiting in eager anticipation for their share in this lavish feast.

We lay back amongst our cushions, feeling much like the small boys in comic pictures who have just finished their Christmas dinner. Lazily we looked around us, and, attracted by the sound of whispering, our gaze was directed to the far end of the courtyard; there we could just distinguish glistening eyes surveying us from behind the moucharaby on the first floor. The ladies of the harem were evidently deeply interested in the guests of their lord and master.

More tea was brought in, and we each had to drink another three cupfuls, and to eat a suitable number of cakes. At this stage our host, relieved of the anxieties of the dinner, sat with us, and we exchanged compliments. My contribution was roughly as follows:

'Though I have had the honour of being entertained in Moorish houses before, and though I hope to have that great pleasure again,

I know that nothing can ever surpass the wonderful courtesy and lavish hospitality with which I have been received to-day.'

To which the reply was:

'Unworthy as I am of the honour given to me by your presence, I cannot properly express the feelings which inspire me; I can only assure you that this is the happiest day of my life.'

The musicians, after their refreshment, sang a final, quaintly-worded song, of which the following is a rough translation:

The sons of Adam are never contented,
Not satisfied with walking upon their feet.
They enslaved the horse and made him carry them,
And then they made swift travelling motor-cars,
So that they could travel faster than all the beasts
of the earth.
But they saw the birds of the air and envied them,
So they made aeroplanes and flew faster than the
wind.
And now they are seeking for some new thing to
make,
For the sons of Adam are never contented.

This song is interesting, for it shows the only forms of locomotion then known to the Moors. They never used carriages, so to them the first real progress made was from horse-riding to the use of the motor-car. The next stage was the aeroplane, used considerably by the French against the rebel tribes in the Atlas Mountains. Trains hardly enter into their calculations, for the only railways then in Morocco had a 2-foot gauge, and the principal traffic was composed of infrequent goods trains.

After this song the musicians withdrew, and a little while later we also took leave of our host, and returned somewhat slowly to our hotel.

SUGAR.

By SYBIL SEWELL DASH.

I.

A SOUND of rippling breezes through the leaves; a swishing, gentle swaying of uncut sheaves; warm, hazy mist on the dim horizon; in the distance a myriad sea of pastel shades, touched here and there with the sun's fiery rays; a soothing hum from the cutters at work, their voices rising and falling in mingling cadences, like the droning of busy bees; miles upon miles of billowing sugar-cane, emerald and yellow in the ripening, and, over all, the never-to-be-forgotten aroma of fresh-cut canes—a panorama of potential sugar at harvesting time.

Sugar-cane and maize (or Indian corn) are somewhat similar in appearance, especially in the shape of the leaves. Cane, however, is hard and tough, as suggested by its name; and instead of being mowed by machinery, as is corn, it is stripped of its leaves, then cutlassed,

and flung into heaps by a gang of black labourers. The leaves are put into pens, serving thereby a dual purpose, namely, food for stock and a base for manure; or else they are used as mulch, being packed round the young cane plants to conserve moisture in the soil throughout the dry season.

Loaded mule-carts carry away the stripped canes almost as soon as they are cut, otherwise rapid deterioration in the sugar contents takes place, and much loss is entailed. From the field they are conveyed to the nearest railway-siding, where lines of trucks, not unlike coal-trucks at home, have been shunted, ready to transport, when filled, their sweet, juicy burden to the factory. These trucks are drawn by steam locomotives through avenues of waving sugar-cane to their destination, where each truck passes over a scale arranged in the track itself, the weight of the cane being thus accurately

measured. From more distant estates bordering sea, canal, or river the cane is brought in on lighters.

II.

It is fascinating to watch for a while the scene of tremendous activity that surrounds a factory and its neighbourhood during crop time. Shouted orders, screaming, puffing engines accompany the roar of machinery in motion night and day, to which one may add the mingled odours of steam, sweat, and boiling juice.

Reaching the factory, the canes are automatically tilted from the trucks onto an endless chain or platform, which carries them forward towards the first step in the complicated system of sugar manufacture. Only a few yards of their journey is travelled, when a row of sharp knives slash the cane into small bits, simplifying the process of juice-extraction, which is accomplished next by the aid of three or four successive trains of three roller-mills, until, as the cane passes through the last mills, every drop of juice has been relentlessly expressed from it, leaving the canes ground into dry bagasse. This bagasse is used as fuel for the great furnaces, and in well-appointed factories little or no other fuel is required.

Rapidly flowing from the mills, the juice from the live canes is pumped to the top of the factory, where it runs down from the juice heaters to the clarifying tanks. In these tanks the process of clarification is accomplished by the aid of lime, and a separation of injurious substances and impurities occurs, these substances being eventually carried to the filter-press, where they are made into filter-press cakes, and used as manure and food for stock.

From the clarifiers the juice journeys downwards through the filters to what is known as the 'triples' or concentrators. These are large round vessels covered with wood, the first having a temperature of 200° F. and a vacuum of 5; the second a temperature of 180° F. and a vacuum of 16; and the third a temperature of 160° F. and a vacuum of 28. This arrangement of triples was invented in order to save fuel, the steam generated from the first tank being sufficient to furnish boiling power for the second, and similarly the second for the third.

III.

The juice, having been heated, clarified, filtered, and concentrated, has now become what is known as syrup, and has the appearance of clear molasses. The syrup, descending through pipes, is conveyed to the vacuum pans, where crystals are formed at a temperature of 160° F. The crystals, still enveloped in their mother-liquor, which is the real molasses, drop from the bottom of the vacuum pans into receiving tanks on the main floor.

This dark-looking mass of semi-liquid substance is termed *masse-cuits*. The *masse-cuits* are passed into the centrifugals, which are numerous, revolving, perforated baskets standing in a row. These baskets revolve on pivots at a tremendous rate of speed; the centrifugal force generated therefrom separates the liquid coating from the crystals, driving it outwards through the perforations to an outer receiving case, leaving the crystals in the baskets clean, sparkling, dry, and of a delicate creamy tint. The crystals are then dropped through a trap in the bottom of the baskets to a moving platform below the level of the main floor, where they are carried off and bagged, later to be conveyed by motor-lorry or railroad to the dock, where vessels tranship the newly-made sugar to all parts of the world.

The molasses is run into the distillery, diluted with water, and set up in large fermentation vats. When the sugars are completely changed into alcohol and fermentation ceases, the process of distillation takes place in closed retorts or stills. The alcohol is driven off by steam, then condensed, and the process repeated until the desired strength of spirit is obtained. It is stored, and, when required, is filled into puncheons for shipment. If coloured rum is wanted, a little caramelised molasses is put in the casks to give it colour. The residue from distilled alcohol is termed *vinasse*, and is sometimes made use of as a fertiliser.

The finished product in factories is designated 'raw sugar'; in this form it goes to the refineries, where it is granulated. Sugar refineries are gradually being added to the original factories, thus affording a tremendous saving in transportation expenditure, the whole process of cultivating the sugar-cane and manufacturing the sugar being accomplished within a certain district or area.

LOCH GOIL.

(A Roundel.)

LOCH GOIL in a rapture of heathery shadows is lying,

As a rainbow it gleams on the tears and the trances of toil,

And my soul all the day from the dawn to the sunset is sighing:

'Loch Goil!'

As the sun in the mists of the morning is caught in the coil,

As the bird in the net that is captive, but dreams it is flying,

As the star swinging free of the cloud that its glory would foil,

So my heart for the freedom of heights and of waters is crying

For the heath and the haze of a gloaming and glamorous soil,

And thy shadow is ever before me, serene and undying,

Loch Goil!

LEWIS SPENCE.

Chambers's Journal

SEVENTH SERIES

A STORY OF INDOLENT NOON.

By E. ST GEORGE BETTS.

I WAS walking through the greenwood not long ago, leisurely threading a sinuous path round massive trunks, and sweeping aside the obstruction of resilient branches, when, for the second time, I came upon a little open space that had attracted my attention twenty minutes earlier. Unconsciously I had completed a circle, experiencing within the limits of this little wood the same illusion of direction which has so often befallen, on a tragic scale, travellers through vast forests in other countries.

This little clearing was in shape a short oblong, and I had noticed it particularly because of the miniature perfection of the scene. On one of its sides a bank declined to the edge of the luxuriant summer growth which fringed the area all around, and on the short sward of this slope stood, very clearly defined, the upright stems of red centaury and yellow-wort, which with plummet-like precision indicated the shelving of the bank. There was no rankness in the surrounding vegetation, and the turf on the level above the bank, though densely starred with daisies and sprinkled with speedwells, was otherwise smooth and trim. Running across one of the corners, a streamlet emerged from the summer gloom of a thicket, and for a few feet twinkled and lilted over a pebbly bed in the open light of day. By its margin grew a tuft of round-stemmed soft-rush, plumed midway their length, and of vivid pale green at the base, where they issued from the damp moss; and in the streamlet itself the brooklime was in flower. One delightful bush of woodbine spread like a wave over blackthorn and bramble, filling the air with fragrance from its bugle blooms; and sprays of wild roses, some white as vestals, and others pink like glowing daughters of earth, hung about.

Save for the humming of insect wings and the cooing of turtles among the distant sapling oaks, all was so still and stirless that the daisies at my feet appeared to be dreaming above their shadows, and it seemed a violation of the peace when a travelling beetle shook and bowed a flower on his clumsy passage. A short pollard ash-tree, mere dry and lichened touchwood with a big dryad's saddle fungus upon it, had fallen forward, and lay partly within the clearing. Mingled shade and sun fell pleasantly

there, and I sat down with my back against the log, and allowed the tranquil sights and sounds to fill my senses.

An early red admiral butterfly floated over the billow of a lofty hawthorn, and, settling on the head of a mauve-banded teasel flower, unfolded, with a gentle fanning motion, splendours which might have been filched from sunset skies and the purple night. A pair of linnets passing overhead spied the sparkle of the brooklet, and, abruptly diverting their course, dropped down to sojourn there awhile.

The noonday warmth, the drowsy murmur of innumerable hyaline wings, all the sweet encompassing influences conspired to induce a sense of well-being and content that brought me near to sleep, when a thing befell that in an instant transported my senses back from the border with a jump; for on the edge of the turf two or three yards away a minute but perfectly formed hand was suddenly thrust from behind a large burdock leaf, claspings its edge as one would clasp that of a curtain. The leaf was drawn aside, and instantly an elf stepped into the open and looked about him.

Once as a child I had known, or thought I had known, some such happening as this; but the memory had become so faint and far away that long since I had decided it must have been merely a vivid dream of childhood which had become confused with the realities of daylight hours. Now I was not so sure about that later judgment, and in any case realised that at the present moment some conjuncture of time and place—the completion of that circle possibly—had caused my unwitting actions to set in motion the power which withdraws the veil from human eyes, revealing all that the word 'fairy' connotes, while at the same time rendering the mortal himself invisible. An intuition made me aware that this latter virtue now resided within me.

The little man—he was about three-quarters of an inch in height, certainly not more than an inch—stood for a moment glancing keenly about him, and then ran swiftly across the open, nimbly avoiding the daisy stalks, and ducking his head to avoid the petals of the lowlier ones. Arrived at the farther side, without a moment's hesitation he 'shinned'

up the stem of a tall flowering umbel, and took his station among the radiating stalks immediately beneath the flower-head. I arose in breathless excitement. With unnecessary caution I stepped slowly and delicately to the spot and stood above the flower; but the elf was manifestly unconscious of my presence. Judged by a mortal standard, this little fellow appeared to be seventeen or eighteen years of age, and his form and features were faultless in beauty of line and exquisite clearness of chiselling. He was armed with a weapon like a boy's pea-shooter, but very diminutive, and discharging what appeared to be the dried seeds of wild poppies, which he carried in a tiny wallet slung to his waist. His upturned face, dappled with the delicate shadows of the flower canopy, shone with health and joy of life; and if an insect alighted on the flower above, his eyes glittered with excitement as he changed his position in order to get an unobstructed aim. I observed, however, that he treated the big buzzing humble-bees with more respect, and seemed to be a little afraid of these. He had acquired great precision with the shooter, and delighted in taking pot-shots at fairy boys and girls when a favourable opportunity offered; for by this time a number of elves had appeared. When a sharp little cry of pain told of some lucky hit he threw back his curly head in an ecstasy of delight, and I heard the tiny peal of merriment escaping from his lips. There was something in his nature closely akin to innocent malice.

I had been watching this marksman of the flower-top a long time with intense interest, when I became aware of a terrific combat which was taking place a few feet away between two fairies and a shrew. The battle was proceeding in the middle of that path which crossed the clearing, evidently a track worn by the gamekeeper in the course of his periodic rounds. The agility of these two symmetrical little men was marvellous, as they thrust and dodged and leapt at their savage foe, whose vicious squeaks were pitched in the same key as the cries of the two hunters. Several times when the shrew was off his feet for a moment the elves leapt clean across the body, plunging their needle-like rapiers into the huge side of their prostrate antagonist the moment they alighted. The fight was by no means one-sided, and often seemed of doubtful issue. Once, indeed, the shrew obtained a hold on the gossamer vest of a combatant, but his fellow with prompt initiative seized the tail of the beast, and, while the fingers of the fallen elf clung desperately to the dried imprint left on the pathway by a hob-nail, tugged with such super-elfin strength that the fine-spun fabric was rent, and the hunter freed from his dangerous plight. The shrew was in truth making a gallant fight, but his move-

ments were becoming slower, and the heaving ribs told of laboured breath and spent power. A few minutes later the brute lay motionless upon its side, presenting an opportunity for the final thrust, which left it dead in the midst of the path, with scarce a mark to show the cause, so fine were the fairy weapons.

It was a little later that I saw a ring of elfin youths and maidens dancing hand in hand around a frog, which had hopped into the open from the brink of the streamlet. With big protruding eyes, glassily staring, it sat like a frog wrought in plaster while the dance wavered about it. I had often before seen a frog sitting thus, never dreaming that it was under the spell of the fairy folk; but now the mutual relation between myself and those little people was changed.

While this dancing and singing went on, a hare, with dark-tipped ears erect, came slowly loping across the domain, followed in a few minutes by another, which, with twitching nostrils, carefully picked out the exact course of the first. Then a rabbit scurried across with less ceremony, and a blackbird with peevish cackle of alarm flew overhead. The turtle-doves and the wood-pigeons ceased their cooing, and some of the latter, with a noisy beating of wings, rose from the tree-tops and, after making half a circle, flew away. Then came the sound of some one approaching, a dry stick snapping here, or a bough swishing there, and presently the gamekeeper emerged and glanced about him.

A big man with sandy whiskers, quiet shadowy eyes, and broad, slightly-rounded shoulders, some quality of silence hung about him like that of a lonely tree brooding under the moon of a still night. He caught sight of the shrew, and carelessly kicked it from the pathway as he went by; the retriever trotting at his heels turned to sniff at the body, and then, with more interest, put his nose to the track along which the hares had passed. Meanwhile I had withdrawn into a recess behind a wild-rose bush. The fairies had left the bemused frog—which immediately with three big hops reached the sanctuary of rushes—and had ranged themselves in two irregular lines on each side of the path, to watch the progress of this gigantic being built in their own shape. They found this pastime wonderfully exhilarating, if smiles and shrieks of laughter were evidence. They accompanied the gamekeeper's diagonal course through their realm, and when he was half-way across I saw one adventurous young hooligan frantically tugging at the end of a loosened boot-lace which hung from the keeper's right boot, in an effort to free it entirely. Where the path again entered the undergrowth hung the honeysuckle I have mentioned, and as the keeper brushed through, a fairy gymnast, swinging from a tendril, dexter-

ously placed a green caterpillar on his shoulder, which straightway commenced to peregrinate towards his collar.

A propensity to puckish malice was very noticeable, especially among the bigger boys. For instance, a pretty fairy girl was standing under a glittering globe of dew that hung from the tip of a grass blade. With rapture in her eyes the little maid gazed at the luminous sphere, that reflected not only her own sweet beauty, but the green world around and the blue dome above, when an imp of mischief, spying the pretty scene, stealthily crept through the jungle of grass, and, grasping the base of the blade from which the dewdrop hung, gave it a vigorous shake. Full on the upturned face fell the pendant drop, drenching the golden curls and saturating the lovely frock, which for fineness of texture might have been fashioned from the azure of the sky. The child would have fallen to the ground had she not clasped the stalk of a hare-bell for support. And near at hand, peering between two violet leaves, the author of her distress gleefully watched the dripping little figure of the weeping child as she threaded her way among the crowded daisy stems.

Absorbed in these and like unwonted experiences, I had been unconscious of the passing hours; but at length I realised that some change, some subtle alteration in the conditions, had come about. The elves had disappeared. I looked at my watch and found that it had stopped. Feeling very tired, I sat down in my former place near the fallen ash, and presently fell into a dreamless and refreshing sleep. When I awoke the sunset hour had passed into summer twilight. Without difficulty I found my way out of the wood, and walked slowly in the direction of the village and home.

Across the valley on the left I heard the sharp cry of a little owl, which was immediately answered by another, and by yet another from more distant pastures. White moths fluttered over the wayside grass and flowers, and overhead the snap of a bat's jaws could be heard,

like the crack of a green laurel leaf broken across the mid-rib. From far away came the hoot of a motor-horn, and, nearer, the sound of a fast-trotting cob's hoofs rang on the hard road. On reaching the highway I lit my pipe, and before I arrived at the garden-gate the moon had risen in silent splendour above the valley.

The next morning I took a rod with me, intending to try for a big chub I had seen a mile or so down the river. As I passed the last house of the village where Peagrim, the gamekeeper, lived, I saw him under the walnut tree feeding his ferrets.

According to custom I stopped to pass the time of day, for he was something of a naturalist, and we had interests in common. With such skill as I could command, the conversation was conducted to a point where I could ask in a natural way if he had ever noticed and considered the fact that dead shrews were seen lying on the ground more commonly than other small creatures of the sort.

He said he had—often, but more particularly in the autumn, although it was only yesterday he had noticed one in Shackwell wood, on the side nearest to Dicksie's farm. He said, further, that a gentleman down for the shooting in autumn had told him that a shrew-mouse couldn't go long on an empty stomach, but died very quickly unless it got enough to eat. He wouldn't deny that this might be true, but in his experience as a gamekeeper he had often observed that shrews were vicious little beggars, and his opinion was that when a couple of bucks meet in the open they fight like blazes, and the weaker of the two is left to feed the blow-flies and carrion beetles. He said also that he had an old book in his house which told of folk and cattle being shrew-struck, and that, as a consequence, whenever a shrew happened to cross a human pathway it suffered instant death as a sort of judgment upon it; but nobody, he remarked, believes such tales now-a-days.

After a little further talk I said good morning and passed on, without telling him I had been in Shackwell wood the day before.

'AMBASSADORS OF COMMERCE.'

By CLIVE HOLLAND.

I.

THE calling of the commercial traveller is almost as ancient as commerce itself. Indeed, one can easily imagine that the 'commercial' had a seat in the Phœnician galleys and the Greek triremes which carried civilising and conquering hosts into then unknown portions of the world. Certainly there must have been a commercial traveller among the Canterbury Pilgrims of Chaucer, and in the

employ of the rich merchants of the Elizabethan age, who pushed their commodities through the Continent, and did so much to lay the foundations of the commercial supremacy of the British Empire to be.

Few callings have in recent years been so rapidly developed and changed by the advances made in the science of transport and locomotion as has that of the commercial traveller. From the led pack-horse, which in the Middle Ages bore the samples and goods, to

the swift aeroplane of to-day, now rapidly coming into use for 'rush' tactics in trade pushing, is indeed a far cry. The introduction of steam and electric current and petrol driven motors has revolutionised transport, as regards both human beings and goods. It is only natural that this speeding-up has led to competition in trade being so immeasurably increased in keenness that it has become almost impossible for any but the best men, with strong physique, and of high mental calibre, to stand the wear and tear of conducting business and bringing trade negotiations to a successful issue.

The head of a great commercial house recently said that 'it is only those who are thoroughly abreast and in sympathy with the times, and who have good physical health, and those who can think and act promptly, who can hope for a place in the race for success. One must possess an encyclopædic knowledge of the variations and developments of the particular trade in which one is engaged, and be able to "push" the "lines" in which one travels, not only with persuasive eloquence, or (as it is commonly known) "the gift of the gab," but with intelligence, and a whole battery of facts relative to the advantages which will accrue to the trader in the handling of the particular goods in question.'

II.

The changes in the art of trading and the art of advertisement—which latter may not unjustly be considered as the pioneer for commercial travellers—are so subtle and so rapid nowadays as to place an immense additional strain upon all concerned therewith.

How different, indeed, are to-day's conditions from the old-fashioned, steady-going, ding-dong days of business when commercial travellers went along the high roads on horseback with their saddle-bags in front of them containing their samples. They sallied forth, and were absent from London for six months at a time. They took their statements of accounts with them, and wrote to their houses only occasionally, sending in orders once a week, or once a fortnight, or even at longer intervals, so as to save the then expensive postage. What a contrast even to the old coaching times, when it took as many days as it does hours now to reach London, and when the shopkeeper who had ordered the goods had to get up at all hours in the night to receive them from the London stage delivery vans. The coaching days passed away when the railways came, and to-day the railways are being outdone by motor transport for both the commercial traveller and his goods, and high-powered aeroplanes are pressed into service for the rapid transit of specially valuable or perishable articles in cases of emergency.

Fifty years ago 'commercial' visited their customers every two or three months, which was by many of them considered too often. Then the visits were increased to monthly ones, fortnightly and even weekly in some cases. And nowadays, unfortunately for the 'commercial' of the smaller and less up-to-date type, parcels post and quick delivery have caused many a country shopkeeper to do a great amount of his orders by post and from catalogues.

Commercial travelling to-day has, indeed, from its extraordinary developments, become one of the most laborious and anxious of occupations; and the practice of ordering small and frequent parcels of goods, in place of the large orders of the past, has made it necessary to take a dozen orders instead of one or two daily. And instead of visiting in almost a leisurely manner two or three towns a week, the 'commercial' may have to visit eight or ten. The prevalence of frequent small orders, in place of the usual quarterly or monthly delivery of goods, has in the large commercial houses led to a great increase in overhead charges, and in the expense of packing-paper, string, and packing-cases.

Here is a reminiscence of an old commercial traveller whose memory can go back pretty clearly for a period of sixty years. He paints a vivid contrast when he says: 'In the old days when I used to drive out in a gig from a town served by the then incomplete railway systems to neighbouring towns and villages, some of my customers would, in good weather, come out along the road to meet me for the pleasure of hearing the latest news, and obtaining a local monopoly in a certain line of goods, and for the drive back. Then next morning there was the leisurely chat, and equally leisurely display of samples to one's customers, in place of the nowadays' rush and tumble of a ten minutes' rapid and sometimes disjointed talk with the manager of a department, or chief salesman of a smaller shop.

'There were "scoops" (as the newspapers say) in those days, and it was easier than it is at the present time to get ahead of a rival by the exercise of a little push and additional enterprise, and pick up a good fat order in consequence. I remember on several occasions many years ago, when the exclusive sale of some Christmas novelty in country towns was considered a far more important matter than it is to-day, doing wonderful business by taking night trains across country, or driving in a conveyance all night, and by these means arriving at some town or other a day or even half a day ahead of a rival. Nowadays, the day or half a day has been reduced to half-an-hour, or even a few minutes, in the rush of competition.'

III.

Another phase, connected with the altered conditions in the lives of commercial travellers

during recent years, is the fact that thirty years or so ago good wholesale firms would have considered it almost as much beneath their dignity to send out a circular or a price-list as did then first-class retail firms to ticket the goods in their windows. All this has been altered; the former spend hundreds and even thousands a year in circularising their customers, and the latter have so run to ticketing their windows that it is almost a case of being unable to 'see the wood for the trees.' Indeed, if the retail traders read all the circulars they receive, and saw all the travellers desiring interviews, they would have no time to conduct their legitimate business.

When one reflects upon the romance which once clung to the calling of a commercial traveller, who made leisurely journeys from town to town, and along the high-roads of the countryside; who was known to all his customers; who was usually an urbane and even placid individual, instead of the often 'nervy,' highly-organised, pushing salesman of to-day, who rushes about in express trains and high-speed motor cars,—one wonders if things are better than they were. Whether the 'commercial' of to-day is happier than he of yesterday? Whether he enjoys life more? And lastly, whether 'the game is worth the candle'?

Certainly to-day there has to be more business done by the 'commercial' to attain the same monetary results. To those who know him we think the following conclusion regarding him will be arrived at, namely, that he has immensely improved in intellectual type during the last half-century; he is less of an animal and more of a man; he eats (how some of the old 'commercials' could eat!) and certainly drinks less, and thinks more. He may not have quite the same bonhomie, and he is certainly more 'nervy'; and though he tells good stories of the road, he does so in a less leisurely and pompous, and more staccato manner. He occupies a more important position to-day than formerly, if he is a first-rate man. His duties are less in the nature of a dull routine. He is less of a traveller, and more of an agent; and the greatest of 'commercials' almost, indeed, deserve the somewhat grandiloquent description sometimes given them by public speakers, of 'Ambassadors of Commerce.'

An increasing amount of latitude in the exercise of individuality of method is permitted the first-rate man; and, indeed, is it not by the granting of such liberty that the capacity of the salesman is increased, and the fame of great business houses built up throughout the length and breadth of the country?

The spirit of the age is such as compels men, almost against their wills, if they would succeed to the highest degree of which they are capable, to set a standard which arouses in them an enthusiasm for commerce.

IV.

The pack-horse led by the 'commercial' of the Middle Ages along the infrequent highways and the almost unknown byways, the saddle-horse and saddle-bags of a later period, the gigs of the Victorian age—all have been left behind by the coming of the railway and the motor car. The six or seven miles an hour has been increased to fifty or sixty, and, on occasion, by aeroplane to over double that amount. The one or two orders a day has given place to a score or so; the multiplicity of small things, rapidly but carefully executed, has taken the place of the two or three large parcels a year of former days.

All this, of course, has meant additional wear and tear upon the mental, physical, and even moral qualities of the 'commercial.' To-day he has no time for the substantial meals of a former period. His travelling expenses have been increased; but there are compensations. The heavy drinker and the gay liver of former days—and there were such—are no longer met with to anything like the same extent, for they cannot hope to compete with the healthy, youthful, quick-brained, clear-headed, active, moderate man who, though often not a teetotaler, is frequently more temperate than some so-called temperance folk.

Among other benefits and boons that modern conditions have brought about is the possibility for men who can travel long distances to get home two or three times during the week; and for practically all commercial travellers to get their week-ends at home.

Those who sit in judgment upon the commercial traveller are usually those who know least about him, his strenuous life, the taxing of his energies, the discomforts of his calling even under present-day conditions, his temptations, and his aspirations. His critics are usually men surrounded by the safeguards of home, of wife, and family ties; and what these things stand for few can realise except those who are, save for brief periods of home life, cut off from their influence for weeks and months at a time.

The commercial traveller has large amounts of money passing through his hands and at his disposal; he lives in the very midst of temptation; he has often a positive excuse for drinking, as it is called, 'for the good of the house.' These things truly test the stuff of which human nature is made, and in many cases does the commercial traveller prove his superiority to the temptations with which his path is beset.

Few who know him will deny that the modern commercial traveller is a brighter, wiser, happier man than his predecessor in past times.

It is true that he has to compete with forces which urge him onwards with lightning speed; but he has increased opportunities of home life,

greater variety of mental interests, and more physical comforts.

World-travellers will tell one of the competition in foreign fields, and urge the necessity for the employment of the highest types of men and the best intellects as 'Ambassadors of Empire and of Trade.' One is inclined to think

that in the past this need for supremacy has been underrated. Every traveller with his eyes open must know that the future of British trade with foreign countries and undeveloped lands lies not only 'upon the knees of the gods,' but in the hands of those who form units in the great business calling of the commercial traveller.

JOHN MACNAB: A COMEDY FOR POACHERS.

CHAPTER XII.—HARIPOL; TRANSPORT.

IT may be doubted whether in clear weather Sir Archie could ever have reached his station unobserved by the watchers on the hill. The place was cunningly chosen, for the road, as it approached the Doran, ran in the lee of a long covert of birch and hazel, so that for the better part of a mile no car on it could be seen from beyond the stream, even from the highest ground. But as the car descended from the Crask ridge it would have been apparent to the sentinels, and its non-appearance beyond the covert would have bred suspicion. As it was, the clear spell had gone before it topped the hill, for Sir Archie was more than an hour behind the scheduled time.

This was Janet's doing. She had started off betimes on the yellow pony for Crask, intending to take the by-way from the Larrig side, but before she reached the bridge of Larrig she had scented danger. One of the correspondents, halted by the roadside with a motor bicycle, accosted her with great politeness and begged a word. She was Miss Raden, wasn't she? and therefore she knew all about John Macnab. He had heard gossip in the glen of the coming raid on Haripol, and understood that this was the day. Would Miss Raden advise him from her knowledge of the countryside? Was it possible to find some coign of vantage from which he might see the fun?

Janet stuck to the simple truth. She had heard the same story, she admitted, but Haripol was a gigantic and precipitous forest, and it was preserved with a nicety unparalleled in her experience. To go to Haripol in the hope of finding John Macnab would be like a casual visit to England on the chance of meeting the King. She advised him to seek Haripol in the evening. 'If anything has happened there,' she said, 'you will hear about it from the gillies. They'll either be triumphant or savage, and in either case they'll talk.'

'We've got to get a story, Miss Raden,' the correspondent observed dismally, 'and in this roomy place it's like looking for a needle in a hayfield. What sort of people are the Claybodys?'

'You won't get anything from them,' Janet laughed. 'Take my advice and wait till the evening.'

When he was out of sight she turned her pony up the hill and arrived at Crask with an anxious face. 'If these people are on the loose all day,' she told Sir Archie, 'they're bound to spoil sport. They may stumble on our car, or they may see more of Mr Palliser-Yeates's doings than we want. Can nothing be done? What about Mr Crossby?'

Crossby was called into consultation and admitted the gravity of the danger. When his help was demanded, he hesitated. 'Of course, I know most of them, and they know me, and they're a very decent lot of fellows; but they're professional men, and I don't see myself taking on the job of gulling them. *Esprit de corps*, you know. . . . No, they don't suspect me. They probably think I left the place after I got off the Strathlarrig fish scoop, and that I don't know anything about the Haripol business. I daresay they'd be glad enough to see me if I turned up. . . . I might link on to them and go with them to Haripol and keep them in a safe place.'

'That's the plan,' said Archie. 'You march them off to Haripol—say you know the ground—which you do a long sight better than they. Some of the gillies will be huntin' the home woods for Lady Claybody's pup. Get them mixed up in that show—it will all help to damage Macnicol's temper, and he's the chap we're most afraid of. . . . Besides, you might turn up handy in a crisis. Supposin' Ned Leithen—or old John—has a hard run at the finish, you might confuse the pursuit. . . . That's the game, Crossby, my lad, and you're the man to play it.'

It was after eleven o'clock before the Ford car, having slipped over the pass from Crask in driving sleet, came to a stand in the screen of birches, with the mist wrapping the world so close that the foaming Doran, six yards away, was only to be recognised by its voice. All the way there Sir Archie had been full of forebodings. 'We're givin' too much weight away, Miss Janet,' he croaked. 'All we've got on our side is this putrid weather. That's a bit of luck, I admit. Also, we've two of the most compromisin' objects on earth—Fish Benjie and that little brute Roguie. . . . Claybody has a hundred navvies and a pack of gillies, and every

beast will be in the Sanctuary, which is as good as inside a barb-wire fence. . . . The thing's too ridiculous. We've got to sit in this car and watch an eminent British statesman bein' hoofed off the hill, while old John tries to play the decoy-duck, and Ned Leithen, miles off, is hoppin' like a he-goat on the mountains. . . . It's pretty well bound to end in disaster. One of them will be nobbled—probably all three; and when young Claybody asks "Wherefore this outrage?" I don't see what the cowerin' culprit is goin' to answer and say unto him.'

But when the car stopped in the drip of the birches, and Archie had leisure to look at the girl by his side, he began to think less of impending perils. The place was clamorous with wind and water, and yet curiously silent. The mist had drawn so close that the two seemed to be shut into a fantastic, secret world of their own. Janet was wearing breeches and a long riding-coat, covered by a gray oilskin, the buttoned collar of which framed her small face. Her bright hair, dappled with raindrops, was batted down under an ancient felt hat. She looked, thought Sir Archie, like an adorable bgy. Also for the last half-hour she had been silent.

'You have never spoken to me about your speech,' she said at last, looking away from him.

'Yours, you mean,' he answered. 'I only repeated what you said that afternoon on Carnmore; but you didn't hear it. I looked for you everywhere in the hall, and I saw your father, and your sister and Bandicott, but I couldn't see you.'

'I was there. Do you think I would have missed it? But I was too nervous to sit with the others, so I found a corner at the back below the gallery. I was quite near Wattie Lithgow.'

Archie's heart fluttered. 'That was uncommon kind. I don't see why you should have worried about—I mean I'm jolly grateful. I was just going to play the ass of all creation when I remembered what you had said—and—well, I made a speech instead of repeating the rigmarole I had written. I owe everything to you, for, you see, you started me out—I can never feel just that kind of funk again. . . . Charles thinks I might be some use in politics. . . . But I can tell you when I sat down and hunted through the hall and couldn't see you, it took all the gilt off the gingerbread.'

'I was gibbering with fright,' said the girl, 'when I thought you were going to stick. If Wattie hadn't shouted out, I think I should have done it myself.'

After that silence fell. The rain poured from the trees on to the cover of the Ford, and from the cover sheets of water cascaded to the drenched heather. Wet blasts scourged the occupants and whipped a high colour into their faces. Janet arose and got out. 'We may as

well be properly wet,' she said. 'If they get the stag as far as the Doran they must find some way across. There's none at present. Hadn't we better build a bridge?'

The stream, in ordinary weather a wide channel of stones where a slender current fell in amber pools, was now a torrent four yards wide. But it was a deceptive torrent, with more noise than strength, and, save in the pools, was only a foot or two deep. There were many places where a stag could have been easily lugged through by an able-bodied man. But the bridge-building proposal was welcomed, since it provided relief for both from an atmosphere which had suddenly become heavily charged. At a point where the channel narrowed between two blaeberry-thatched rocks it was possible to make an inclined bridge from one bank to the other. The materials were there in the shape of sundry larch poles brought from the lower woods for the repair of a bridge on the Crask road. Archie dragged half-a-dozen to the edge and pushed them across. Then Janet marched through the water, which ran close to the top of her riding-boots, and prepared the abutment on the farther shore, weighting the poles down with sods broken from an adjacent bank. 'I'm coming over,' she cried. 'If it will bear a stag, it will bear me.'

'No, you're not,' Archie commanded. 'I'll come to you.'

'The last time I saw you cross a stream you fell in,' she reminded him.

Archie tested the contrivance, but it showed an ugly inclination to behave like a see-saw, being insufficiently weighted on Janet's side.

'Wait a moment. We need more turf;' and she disappeared from sight beyond a knoll. When she returned she was excessively muddy as to hands and garments. 'I slipped in that beastly peat-moss,' she explained. 'I never saw such hags, and there's no turf to be got except with a spade. . . . No, you don't! Keep off that bridge, please; it isn't nearly safe yet. I'm going to roll down stones.'

Roll down stones she did till she had erected something very like a cairn at her end, which would have opposed a considerable barrier to the passage of any stag. Then she announced that she must get clean, and went a few yards down stream to one of the open shallows, where she proceeded to make a toilet. She stood with the current flowing almost to her knees, suffering it to wash the peat from her boots and the skirts of her oilskin, and at the same time scrubbing her grimy hands. In the process her hat became loose, dropped into the stream, and was clutched with one hand, while with the other she restrained the efforts of the wind to uncoil her shining hair.

It was while watching the moving waters at this priest-like task that crisis came upon Sir Archie. In a blinding second he realised with

the uttermost certainty that he had found his mate. He had known it before, but now came the flash of overpowering conviction. . . . For swelling bosoms and pouting lips and soft curves and languishing eyes Archie had only the most distant regard; he saluted them respectfully and passed by on the other side of the road—they did not belong to his world. But that slender figure splashing in the tawny eddies made a different appeal. Most women in such a posture would have looked tousled and flimsy, creatures ill at ease, with their careful allure beaten out of them by weather; but this girl was an authentic creature of the hills and winds—her young slimness bent tensely against the current, her exquisite head and figure made more fine and delicate by the conflict. It is a sad commentary on the young man's education, but while his soul was bubbling with poetry the epithet which kept recurring to his mind was 'clean-run.' . . . More, far more. He saw in that moment of revelation a comrade who would never fail him, with whom he could keep step on all the roads of life—a brightness which by his side would make a glory of the dullest stages. It was that which all his days he had been confusedly seeking.

'Janet,' he shouted against the wind, 'will you marry me?'

She made a trumpet of one hand. 'What do you say?' she cried.

'Will you marry me?'

'Yes.' She turned a laughing face. 'Of course I will.'

'I'm coming across,' he shouted.

'No. Stay where you are. I'll come to you.'

She climbed the other bank and made for the bridge of larch poles, and before he could prevent her she had embarked on that crazy

structure. Then that happened which might have been foreseen, since the poles on Archie's side of the stream had no firm foundation. They splayed out, and he was just in time to catch her in his arms as she sprang. 'You darling girl,' he said, and she turned up to him a face, smiling no more, but very grave.

Archie, his arms full of dripping maiden, stood in a happy trance.

'Please put me down,' she said. 'See, the mist is clearing. We must get into cover.'

Sure enough the haze was lifting from the hillside before them, and long tongues of black moorland were revealed stretching up to the crags. They found a place among the birches which gave them a safe prospect, and fetched luncheon from the car. Hot coffee out of a thermos was the staple of the meal, which they consumed like two preoccupied children. Archie looked at his watch and found it after two o'clock. 'Something must begin to happen soon,' he said, and they took up position side by side on a sloping rock, Janet with her Zeiss glasses and Archie with his telescope.

His head was a delicious merry-go-round of hopes and dreams. It was full of noble thoughts—about Janet and himself and life. And the thoughts were mirthful too—a great mellow, philosophic mirthfulness. John Macnab was no longer an embarrassing hazard, but a glorious adventure. It did not matter what happened—nothing could happen wrong in this spacious and rosy world. If Lamancha succeeded, it was a tremendous joke; if he failed, a more tremendous; and as for Leithen and Palliser-Yeates, comedy had marked them for its own. He wondered what he had done to be blessed with such happiness.

(Continued on page 395.)

THE LURE OF OLD BOOKS.

By DANIEL J. M'ARTHUR.

BETWEEN the collector of first editions of modern authors, and those steeped in the lovable smell of old leather and faded parchment, there is a wide gulf fixed. The lure of well-worn morocco and rough, hand-made paper is a strong one, and the contents of such volumes are veritable gold-mines of interesting anecdotes and sage wisdom; written, too, in a style of English which would put many a modern product to shame.

Old books are like old friends—the better for the keeping; landmarks on life's journey. And if there be no fashion-plate air about them, one is sure they will fit the shelves of the old mahogany bookcase (with its capacious cupboard beneath for the 'paper-backs') without alteration, while, if their dignified regularity of shape may not flirt with our sense of colour, like

many of the slim, smartly-bound modern books, yet their virtues are greater than merely having a pretty 'jacket' to cover their inner weaknesses.

The side-notes (written in an old-fashioned, crabbed style of handwriting) on many book-stall bargains are often the best part of these dog-eared volumes, and are a distinct stimulus to those who can appreciate their worth. The affectionate inscriptions on the title-pages are equally interesting. Once, no doubt, boon companions, these old books, even now, convey an atmosphere which stirs up in their new owners reveries of bygone days and lives long since forgotten.

Yes. To rummage over the flotsam and jetsam of the bookstalls, or browse leisurely in the dark recesses of the back shop—once you are known, and permitted to enter that

inner sanctum—is a pleasure which has many devotees. There one may spend half a day poring over many books and buying none, without a word being passed; for old books need no conversation, rather the reverse.

And there is no haggling over the price. As a rule they are huddled together, at set prices, irrespective of subject, binding, or original cost; or the price is obscurely marked inside the cover—a gummed price-label is an abomination to all book-lovers, remember.

One should never approach a bookstall with any definite object in view. Any book really worth having, despite the fact that it may now be lying midst a heap of undusted, unclassified miscellanea, is most unwilling to be wooed in any such commercial spirit. Besides, half the pleasure surely lies in the casual looking-over many volumes in spare moments.

But it is equally unwise ever to pass by a favourite bookstall or delay making a purchase. 'The next time' is always too late. The desired book has come and gone, as many a book-buyer has learned to his cost.

'Hope springs eternal' is, of course, the unconscious motto of all book-buyers, and one need not be averse to finding a bargain in the course of searching for our own more humble books. There are a few minor prizes still to be picked up. To some men these seem to come quite readily, while others search vainly, but with keen enjoyment, all their days, without finding one volume of any note.

'First loves are best' in books, and no new edition of a favourite work can ever take the place of that old, tattered copy one picked up 'for a song' in the now far-back days of our literary youth.

THE YELLOW FIELD.

PART III.

IV.

I RODE post in the hardest way to get to the coast, reaching Fescamp a little past midnight, finding the place asleep, but rousing it to such purpose that well ere two of the clock I sat in a fisher-boat, drifting off shore with the tide—with the fisher-captain, his son, and me holding our cheeks for a sign of wind to take us across.

The wind came soon after dawn, but anon veered contrarily; and what with its unfavour, and with having to run many sea-miles out of our road to keep from some English war-vessels that might have seized us, we were ten miles from the Sussex coast at dawn of next day. Presently there came along to us an English boat—her captain being none other than Dick Collins, who recently had taken me to France; he now thinking we had a cargo of brandy.

I transferred to him. I asked him no word of Miss Herbert, and was glad he spoke not her name; for, since the first streak of daybreak, a new, great dread had been growing in me—that I should hear, not that she was put to death, but that she was dead of prison fever. So, as I have told, I asked nothing; and shortly after seven of the clock Collins landed me at Hastings itself. For, so long as I was in England, whereby I was in touch with the authorities, I cared not if I were recognised and arrested forthwith. Indeed, I had some thought that I should help Miss Herbert most speedily (were I not too late) if I went at once to the house of some justice, surrendered to him, and told him why I was come.

I stood on Hastings water-front, in the morning sunlight, debating—chilled, despite the sunlight, from my long hours at sea; stiff,

weary, hungry too, with my head aching withal. And I was hard looked at by some fisher-folk near me until Collins spoke with them (bidding them mind their own affairs, I think); for, except that I wore a cloak, now fallen half open, and riding-boots, I was dressed as on St Germain terrace, in my rose-hued court clothes, with a hat of new French mode and a new French peruke.

I wondered where the jail lay, being much inclined to turn thither, that Miss Herbert, if alive, might swiftly know I was here. And then my best plan came to me. I would first seek her father—Morgan Herbert, of Stanningly Manor, the newspaper had said; and doubtless the Manor House was that one near the yellow field, whereof I had seen the roof.

I called Collins, learnt this was the house, then walked to the nearest inn and ordered a horse, while which was being readied for me I shaved and ate a mouthful. Then I rode out of the town, and presently past the green turf (coarse and short) of the cliff-top where Michael had died, and then along the road over which he had brought me most willingly—with my spirits sunk lower than they had yet been, for dread that I should find Mr Herbert mourning for his daughter.

I came—where the road was amid trees—to some gates that I knew must be those of the Manor. In drawing rein I bethought me that, were I to go on for a few paces, I should see the yellow field. I had no wish to see it, but I was fain to delay a minute from Mr Herbert's tidings; so I twitched my horse forward. I passed from the trees to the little plantings which separated the field from the road, and, in the hot sunshine, I looked at the field—no

longer yellow, save for specks of flowers peeping, for the grass was grown very high, billowing like a sea of smoky brown—and away in the midst of the grass, waist-high, *was some one that instantly I knew*, though I had seen her but once ere this, and her hood and gown were faint blue now instead of primrose.

When I had got from my horse and fastened him to a plantling, I stood with my back to the field wiping my eyes with my kerchief before doing aught else. For, with the words of thankfulness, all mingled and confused, that had rushed from my mouth—to see *her* well, and free, with no sign of danger about her—there had run, pretty fast, tears from my eyes, with my throat very strange and aching. And when I was come to foot the thought that, with her thus safe, I was like to see St Germain again and greet my mother did nothing to stay my tears. I had not expected to see St Germain.

I wiped and pressed at my eyes; blew my nose. I took off my cloak and laid it on the saddle; then wiped my eyes again, hard. Then I turned to the field and stepped between the plantlings into the billowing of brown-feathered grass, and so toward her, drawing off my hat.

She had been searching for certain grasses and flowers. When she saw me she stood holding a thick wisp of them, mostly grasses, against her blue gown, her darker blue eyes intent with me, but not knowing me for the cropped-pated, muddled wretch who had fought with her that day—not knowing me, not suspecting, even when I was two yards from her, I could tell.

I made my bow; and then, lest she should be a little afraid when I discovered myself, and because I was very penitent, I knelt down on one knee, looking no higher than her hand which held the grasses. 'Madame,' I said, 'I am sorrier than I can tell that Michael died. But I did not beat him or ride him hard, madame. He and I were friends before we were past the trees, and he was happy to canter, and wished I would not check him. There was no unhappiness for Michael, madame. And I think he could not have lived above a week or two—though I would not have you blame me less for that.'

She had given a little astonished cry, in no way loud, when I spoke Michael's name. And I saw her move a little backward from me through the grass. I saw her slim hand, holding her grasses, move and move, tightening and relaxing. But I paused not in telling her what I believed would comfort her for Michael—and moreover was true. And then, still gazing no higher than her hand, I said: 'I am very sorry I did you cruelty and brought you sufferings. You will believe I am sorry, will you not, madame, when you see I have come back to England, thinking you needed me?'

She spoke no word. I saw her hand with the grasses steal upward; and I looked up at her. She was crying. I saw her blue eyes aswim with tears, aswim pinkly, where they were not dark blue, from the force of her tears. And in this moment I noted what, in my base cowardice of the other day, in my emotions as I walked to her to-day, I had not noted till now—though in sooth 'twas very clear to be seen—I noted she was of extreme, sweet prettiness—of such prettiness that, methought, whether she cried or smiled there could be no change of her prettiness. I knew not that I should ever see her smile. She was far in the midst of tears now. Her eyes had met mine for the briefest space—then she turned away, pressing the stem parts of the grasses in her hand against her lips, and seeming to sob under her breath against the grass stems.

I could not tell whether 'twas more for Michael or more for her imprisonment that she cried; or whether, most of all, 'twas because she found herself with me, who had used her so cruelly ill. I knew not how to speak to stay her tears, but said again, 'You will believe I am sorry, will you not, madame—from my being here?'

With the grasses pressed to her mouth, with her sobs perceptible by the shake of her blue hood, edged with dark curls, by the shaking of her arm lifted with the grasses, she spoke nothing for seconds—I kneeling on, watching her, thinking, well-nigh to the exclusion of all other thoughts, that the picture of her thus was going to follow and reproach me through many years of my life—perchance to its end.

'Oh, madame!' I said pleadingly.

Whereat, after a moment, she turned and looked directly on my face, her eyes strangely wide in their unhappiness, very dark blue and pink-swum in the shining tide of her tears—with tears by threes and fours upon her cheeks. She moved the grasses, by a lip's breadth, spoke to me over them, in a trembling whisper. 'I would . . . you had not come!' she said. 'I would, *so verily*, you had not!'

'By your favour, madame,' I answered, 'I am very glad to be here—to tell you I am sorry, to clear you of blame—if they blame you still?'

'They never blamed me,' she whispered. 'Twas a lie—a snare . . . that I begged them lay. . . . And you are enticed into it!'

She turned her face a little, still holding the grasses to it, and looked at the road. And I, with that word 'snare' in my ears, could not forbear to cock my chin and gaze sharply over the brown—high around me as I knelt—toward the road; perceiving it empty save for my horse.

Then I looked at her, her eyes returning to me at the same instant. 'I am happy 'twas only a snare,' I said; and I knew that I was

very sincere in speaking thus. 'Nay,' I insisted, seeing in her eyes that she would not believe me—'nay, I am truly happy 'twas only that. Why, think you, madame, when I was on my road hither I was wretched with fear that—that you were dead. After that, what doth a snare matter when you stand here alive?' And verily (being a proper man to-day) I found that I cared scarce anything what the snare she had spoke of threatened to me, since she was here in full life in the sunshine. And how pretty she was!

She was speaking again, still over her swathe of grasses, still not above a whisper. 'I did believe you were too hard to come,' she said. 'I did believe you would care nothing—however great wrongs you deemed you had done! . . . While I did believe that I was fain to try to fetch you—fain to bring you to harm, even to your death . . . I cared not, I was so wicked! . . . I cared not, because of Michael . . . that I loved, and you killed.' She paused, breathing a sob, her eyes,

in their tear-swim, remaining on my face. 'But now you *are* come,' she whispered, 'now you are not so hard—oh, *I would you were not come!*' She breathed a sob again; and again. 'Oh, I would I did *never* think to beg my lord!'

'My lord?' I asked, wondering—of all wayward thoughts—if he were a lord she was betrothed to.

'My Lord Nottingham, my mother's cousin,' she whispered.

And then her hand with the grasses moved from her face, moved toward me in a gesture at my kneeling. 'Do not, pray,' she whispered. 'I had meant to bid you not . . . but I am all thoughtless, all distressed—you can tell.'

I stood up, conscious that I did it the more lightly from knowing that the lord was no betrothed of hers, but Nottingham, the lord chamberlain (a powerful man he, in this present England); conscious that I was wishing much that she was betrothed to no one.

WAYFARERS OF THE HIGHLAND HIGHWAYS.

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals, Tracks and Tracking, &c.*

I.

TWO of the most interesting and refreshing characters with whom I have 'rubbed shoulders' during sixteen years of motoring in the hill country were a brace of Scottish road-menders. For over twenty years the two of them had lived and slept alongside their road-roller, all their worldly possessions being stowed in the gray caravan which the old engine towed faithfully over hill and dale. For her they lived; she was the pride of their lives, their only worldly care, for both were unmarried. Every nut she wore shone like a star, every brass plate was a mirror—particularly the one which bore her name, 'Heather Queen.' Why Heather Queen I do not know, because she had nothing to do with the heather; but there we are.

The interior of the caravan was almost depressingly spotless, and from the whiteness of the sheets and the lace curtains one would have thought that some Martha-like housewife tended the place with loving care. If Peter was not polishing and smoking, he was elbow-deep in the washtub, and Ewen was smoking and polishing. Never was either of them idle, except when they had company, which was not uncommon.

These two men and their engine had, of course, been tied to one county, and certainly there was no nook or corner of its highways

and byways which they did not know, no regular roadfarer with whom they were not on nodding terms. In those days the roads required less attention than they do to-day, and having repaired one section, the outfit would amble elsewhere according to instructions. It always seemed to me a very leisurely proceeding, and indeed it could not very well be otherwise, for though the Heather Queen shone as if she were new from the works, she was a back number, and her maximum speed was in the vicinity of 3 m.p.h. In so hilly a region she would probably not average over 2 m.p.h., which seems almost incredible to a different section of the road-faring fraternity. Still, it is purely a matter of educating oneself to given circumstances. We have learnt to think along a basis of 30 m.p.h., but Peter and Ewen had grown up to 2 m.p.h. That was the speed at which they thought, that was the bedrock of their reasonings. If, descending the mountains, they actually knocked off three miles in the hour they thought they were 'going some.' At four miles an hour they would have been bewildered. How can one take in the scenery when hurtling along at walking pace?—and assuredly that night Peter would feel it behooved him to touch up every nut with a spanner. For speed will kill even a road-roller.

All the same they were very sound men, and I used often to call in for a smoke and a chat

with them of an evening. In their company one was ever conscious of a sense of leisurely repose, for few people these days know the refreshing rest of company which thinks at 2 m.p.h. Neither of them ever hurried; it would have been as impossible to hurry them as it was for them to hurry the Heather Queen. Each and every day they went steadily ahead with their work, and it must be admitted that they achieved a long and a good day's work. For what better than the task of repairing life's highways and byways for others to tread? Back and forth, back and forth, squashing in the stones, squelching down the slush, then a bite at the wayside and more water for the Heather Queen, gaily hissing steam. Sometimes a way-farer would ask to leave a parcel in the caravan till he or she returned; sometimes Peter would close the accelerator and place a massive thumb on the crank of the safety valve while Ewen led by a refractory horse. Yes, there was more variety in their lives than in the lives of those whose sorry lot chains them to pen and desk. More incident, more anecdote, though not much breathless thrill.

II.

And the evenings? Sometimes they were parked in a farmyard, sometimes in a flower-starred offing at the roadside. When one strolled along Ewen would be sauntering up with the drinking water in his shining bucket, and Peter scouring the girdle. But soon the three of you were squatting on the steps with pipes well going, discussing at 2 m.p.h. whatever it might be. Sometimes politics; more often nature and one's fellow-men, if there is any difference. Here a throstle was singing, there in the distance was the rush of the river; then, as the sunset darkened, one would remark—'Are ye no' fishin' the nicht, Ewen?'

At this Ewen would rise. 'I was half-minded tae tak' a turn,' he would remark, going into the caravan, where his rod slept intact above his bunk. He was a keen fisherman, and all the fishing in that region was free. 'Wull ye be comin' along the noo?'

So the three of us would saunter down to the river, where Ewen would fish while Peter and I conversed in that sleepy way which the rush of running water seems always to induce. 'Why don't you fish, Peter?' I would ask him sometimes, at which he would shake his head gravely.—'The old caravan's no' too big, and one fisherman jist aboot fills it!'

So at times Peter would chaff Ewen about the fishing, and at times Ewen would chaff Peter about a certain widow lady, who, I gathered, lived somewhere in a farm of her own. 'Och well, Peter,' Ewen would say, 'nine weans are no' sae muckle to start off wi', when ye get a farm thrown in!'

I do not know whether there ever was a widow on Peter's horizon, but if so she had long since faded beyond it; but what I do know is that though Ewen was an angler he fell short in one supposedly essential respect, for no man lacked more the art of lying, save where Peter's widow was concerned. There Ewen's imagination could run riot to some tune, but nevertheless the two were closer than many brothers I have known.

But we must leave these peaceful sons of the oil-can and cotton-waste to the highways and byways over which no doubt they still ramble, though, looking back on the days when I knew them, I find them and their gray caravan and the old Heather Queen enshrined in very sunny memories.

III.

There are the Highland gipsies—those wandering wisps of humanity, as R. L. S. might have called them, whose heritage is the mountain way, whose brother nomad the hill storm. Of that wistful procession of nomads, for ever drifting over the mountain roads, washed to the outside edge, as it were, like so much of life's flotsam, very few are banshee gipsies of the old true stock. Among these the women are handsome—fine upright creatures, of clear dark skin, who support the colours of their race, and who do most of the work. The women it is who gather the willows and weave the baskets, though the men generally do the tinkering, from which they derive their Highland name of 'tinklers.' Some of them are very skilled, and one old fellow I knew could do anything from dressing salmon-flies to riveting and repairing porcelain breakages. But he belonged to the old school, and I fear that for the most part the male element of even the pukka gipsies has sadly deteriorated during recent years, as 'savage races' generally do when civilisation creeps in. For the gipsy of twenty years ago *was* little more than a savage. He lived in the main by predatory means, or rather he possessed the gift of living without any means at all. Now it is all too easy to pick up loose cash by dint of the bag-pipes, or by other means which open up with the advent of the holiday-maker, and generally speaking the Highland gipsy of to-day is a shiftless, idle lot, whose unkempt hair and unwashed face tell their own story of degeneracy.

Still, there are gipsies and gipsies, and in spite of the woeful story of poverty and privation which most of them can pitch, there are many who have more than a wee dram in the bottle for the morning.

Often when in the hills I have made friends with these people, who have their own little etiquettes and their own code of hospitality. From the tourist they are ever ready to beg, and tweeds that are too bright, an accent too

distinctly southern, stamp one at once as their natural prey. But come down from the deer forest in old storm-faded tweeds, a foot of peat-stained puttee wound round your boot tops to keep out the ling tips, your thumb-polished rifle bearing the mark of more than one impact with the rocks, then perhaps—but no, it is not that at all! Garbed or ungarbed, the gipsies would weigh you up, for how does one lover of the great outdoors instinctively recognise another? How do we know at a glance that here is one who is a kindred spirit—one who, like ourselves, knows the lash of the storm, and loves the great loneliness of the hill road? How do we know as our eyes meet that here is one in whose veins the gipsy blood runs, whose heart is for the wild sports which are alone with God and the infinite, and who would not turn from the roadside for all the cut-and-dried methods of the sports of to-day? Champagne for lunch, a collapsible seat, a peg bearing your number, and a scythe-swept pathway leading up to it. A dry sheltered seat, a man to work the dogs, and a host of flying targets drilled to rocket as they should. On the other side—with a deep gulf between the two—the long tramp through the heather, the storms, the cutting winds, the flooded torrents, and in the end, if you are lucky, a wee, uncoloured dram in a peat-roofed bothy away back in the glens.

IV.

But enough of that. The wild sport of the hills, as Charles St John knew it, is not within the reach of everyone, and we have to take what we can get. But the gipsies know at a glance the kindred spirit who saunters uninvited to their big camp fire, seats himself on a log with a gratefully weary sigh, and forthwith produces his tin tobacco-box (always preferable to a pouch, which powders the tobacco when working hard all day).

As a rule the visitor does not have long to wait. The lid of a saucepan is raised, and the air becomes fragrant with the scent of rich venison stew, which bears the magic of such herbs as we know not in everyday life. Or perhaps hare broth, the broth of the white mountain hare, which in this land is thought to be fit only for making broth. Some broth too, because the whole hare, freshly killed, goes into it—barring fluff and clockwork. Or perhaps boiled salmon, which falls apart in pale pink flakes on your tin plate. There are no trimmings, no etceteras. You pull out your skeandhu, if you have one, if not, your corkscrew, and eat as your fathers ate. You know that the salmon was a kelt, which you would not touch at home, and which should have been returned to the water, even had it been caught in the first place by legal methods, which it was not.

There is no hint of payment for such a

meal, but if there is game in your bag you take out a plump blackcock or a brace of grouse, as the case may be, and drop it indifferently by the fire as you rise to go. You make no comment, you expect no thanks, and you get none.

The gipsies do not talk much to strangers, but there are times in one's life when one may hear these people yarning—when their tongues are freed over the smouldering peats in some place where one ought never to have gone. There still are such places back in the corries, where the mother bosom of the hill secretly yields her colostrum, and where nothing is asked of the sportsman save that he live up to the morals he would set, and wipe out, on leaving, all memory of that place where he was an uninvited guest.

Strange conversations are those, drifting in fragments as one lies in one's heather bed, cut off here by a whisper, there by a sentence muttered savagely in Gaelic—stories which bear the fury of the upland blizzard, the wildness of the wind where the jackpine grows low and twisted; tales of forefathers who perished by the ice, who were broken at the penitentiaries, or who lived hale and hearty for incredible years. Tales of love sometimes, into which hatred may have entered, of mean and despicable vengeance, struck snake-like in the dead of night, and belonging to another era; or again, stories which bear the reflected sunlight of the river, and the music of running waters. For our gipsy is nothing if not versatile as the elements which mould his ways, his tongue one moment bearing the venom of the Fork, and the next soft with the love of children, with the poetry of the birch groves when the sunbeams caress them. But there, for what little I know of these children of the storms I find their story still a closed book to me, so we must leave them as we found them—passing travellers on the height of land.

V.

Once I became friendly with a Highland character of a type doomed to extinction, though not so far gone as most people think. I had seen this laddie often, and one day the opportunity occurred of giving him a 'lift.' Scion of a long line who had taken free bounty of hoof and fur and feather, Ronald McQ. was a poacher by birth and by choice. Every keeper and stalker in the glens knew him as such, and by a judicious mingling of giving with one hand while he took with the other, Ronald kept on good terms with everyone. For example, if eagle or fox was proving particularly destructive, and all the keeper's devices had failed to bring it to book, he had merely to pass the word to Ronald, and assuredly the varmint was doomed. A few days later Ronald would saunter up to the keeper's cottage, his game-bag

over his shoulder. With a nod, he would empty the bag over the wall, then with another nod he would go his way. He had perhaps given several days to attaining his object, but he knew that his time was well spent, and, if humanly possible by a knowledge of woodcraft and hillcraft, he would succeed in the end. He had, indeed, been offered several excellent posts, but regular hours and regular pay were not for him.

Again, one day the stalker, meeting Ronald, would remark pointedly—'Some one was out on the hill last night, Ronald, and lifted a stag from the twa' marches.'

'That so?' Ronald would answer airily.

'And I'll tell you what, Ronald,' the keeper would proceed; 'I'm wanting a bag of capercaillie to send away to London on Wednesday night, and the birds seem to have left our hill. Anyway, I can't get them.'

'That so?' Ronald would iterate, and sure enough before the date intimated, he would appear at the keeper's cottage with his bulging game-bag over his shoulder.
